

M.Sc. Biotechnology (2019-2020)

Course code	Core Courses (32 Credits)		
	Course Title	Credits	Course Level
GBC 182	Concepts in Biochemistry	3	100
GBC 183	Molecular Biology	3	100
GBC184	Biophysical Principles & Analytical Techniques	2	100
GBC 185	Introductory Immunology	3	100
GBC 187	Cell Biology	2	100
GBC 188	Biostatistics	2	100
GBC191	Lab I : Techniques in Microbiology & Immunology	3	100
GBC 192	Lab II : Biochemical & Analytical Techniques	3	100
GBC 193	Lab III : Molecular Biology & Genetic Engineering	3	100
GBC 280	Genetic Engineering	3	200
GBC 281	Bioprocess Technology	3	200
GBC 283	Lab V : Cell & Tissue Culture	2	200
	Optional Courses (to choose 16-32 Credits)		
GB0 181	Fundamentals of Microbiology	3	100
GB0 182	Marine Microbiology & Ecology	3	100
GB0 183	Lab IV : Bioprocess Technology	2	100
GB0 184	Lab VI : Bioinformatics	1	100
GB0 186	Field Trips & Report	1	100
GB0 187	IPR, Biosafety & Bioethics	2	100
GB0 188	Bio entrepreneurship	2	100
GB0 189	Cellular Biophysics	3	100
GB0 190	Environmental Biotechnology	2	100
GB0 281	Advances in Plant & Animal Biotechnology	3	200
GB0 282	Bioinformatics	2	100
GB0 284	Food Biotechnology	2	200
GB0 285	Nanobiotechnology	2	200
GB0 286	Developmental Biology	2	200
GB0 287	Genomics & Proteomics	2	200
GB0 288	Enzymes: Chemistry & Applications	3	200

GBO 289	Molecular Immunology	3	200
GBO 290	Stem Cell Biology	1	200
GBO 381	Dissertation	8	300

Programme: M. Sc. Biotechnology

Course Code:GBC-182

Title of the Course: Concepts in biochemistry

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	A sound knowledge of basic chemistry.	
<u>Objective:</u>	The major objective of this course is to build upon the knowledge of basic biochemical principles with emphasis on different metabolic pathways and their integration. Attention is drawn to the structure-function relationships of biomolecules.	
<u>Content:</u>	MODULE I <ul style="list-style-type: none">• Biochemistry: the molecular logic of life.• Biochemical evolution: principles and mechanisms.• Buffering in biological systems; ionization and hydrophobicity• Amino acids; structure and functional group properties.• Peptides and covalent structure of proteins• Levels of structural organization, sequencing, 3-D structure and functional diversity of proteins, the concept of the proteome; the Ramachandran Plot; structure-function relationships in model proteins such as ribonuclease A, myoglobin and hemoglobin• Enzyme catalysis – general principles of catalysis; catalytic power and specificity quantitation of enzyme activity; Michaelis-Menten kinetics; relevance of enzymes in metabolic regulation MODULE II <ul style="list-style-type: none">• Carbohydrates - structure and biological role. Sugars- mono, di, and polysaccharides with specific reference to glycogen, amylose and cellulose• Basic concepts and design of metabolism - glycolysis, gluconeogenesis, reciprocal regulations	12 hours

	<p>and non-carbohydrate sources of glucose</p> <ul style="list-style-type: none"> • Citric acid cycle, entry to citric acid cycle, citric acid cycle as a source of biosynthetic precursors; • The pentose phosphate pathway • Bioenergetics – basic principles; equilibria and concept of free energy; coupled interconnecting reactions in metabolism; oxidation of carbon fuels • Thermodynamic quantities and laws, equilibria and concept of free energy, ATP as the main carrier of free energy in biochemical systems. <p>MODULE III</p> <ul style="list-style-type: none"> • Lipids – Structure and properties of important members of storage and membrane lipids; lipoproteins • Fatty acid synthesis, β-oxidation; biosynthesis of membrane lipids and sterols with specific emphasis on cholesterol metabolism and the mevalonate pathway • Protein turnover and amino acid catabolism; nucleotide biosynthesis (<i>de novo</i> synthesis and salvage pathways) • General principles of intermediary metabolism and regulation of pathways. • Mitochondrial electron transport and its inhibitors • Oxidative phosphorylation; importance of electron transfer in oxidative phosphorylation; F_1-F_0 ATP Synthase; shuttles across mitochondria; regulation of oxidative phosphorylation. • Photosynthesis; the two photosystems; proton gradient across thylakoid membrane; the Calvin cycle. • Vitamins and hormones: chemistry and physiological role. 	12 hours
		12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Stryer, L. (2015). Biochemistry (8th ed.) New York, Freeman 2. Lehninger, A.L. (2012). Principles of Biochemistry (6th ed.) <u>Learning Outcomes</u>	Gain fundamental knowledge in biochemistry and understand the role of enzymes in the regulation of metabolic pathways.	

Programme: M. Sc. Biotechnology

Course Code: GBC-183

Title of the Course: Molecular biology

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The aim of this course is to obtain and understand fundamental knowledge of molecular and cellular processes such as RNA transcription, protein synthesis, mutation, epigenetic modification and gene regulation.	
<u>Content:</u>	<p>MODULE I</p> <ul style="list-style-type: none"> • Structure of DNA - A,B, Z and triplex DNA; • Organization of bacterial genome and eukaryotic chromosomes Heterochromatin and Euchromatin • DNA melting and buoyant density; T_m; DNA reassociation kinetics (Cot curve analysis) Repetitive and unique sequences; Satellite DNA; DNase I hypersensitive regions; DNA methylation & epigenetic effects. • Structure and function of prokaryotic and eukaryotic mRNA, tRNA (including initiator tRNA), rRNA and ribosomes. Processing of eukaryotic hnRNA: 5'-Cap formation; 3'-end processing of RNAs and polyadenylation; loop model of translation; Splicing of mRNA. • Gene transfer in bacteria-Conjugation, transformation and transduction. • DNA mutation and repair, Transposons 	12 hours

	<p>MODULE II</p> <ul style="list-style-type: none"> • Prokaryotic and eukaryotic transcription -RNA polymerase/s and sigma factors, • Transcription unit, Prokaryotic and eukaryotic promoters, Promoter recognition, Initiation, Elongation and Termination (intrinsic, Rho and Mfd dependent) • Gene regulation: Repressors, activators, positive and negative regulation, Constitutive and Inducible, small molecule regulators, operon concept: <i>lac</i>, <i>trp</i> operons, attenuation, anti-termination, stringent control, translational control. • Eukaryotic transcription - RNA polymerase I, II and III mediated, General eukaryotic transcription factors; TATA binding proteins (TBP) and TBP associated factors (TAF); assembly of pre-initiation complex for nuclear enzymes, interaction of transcription factors with the basal transcription machinery and with other regulatory proteins, mediator, TAFs. ; Silencers, insulators, enhancers, mechanism of silencing and activation. <p>MODULE III</p> <ul style="list-style-type: none"> • Translation in prokaryotes and eukaryotes, • Regulatory RNA and RNA interference mechanisms, miRNA, non-coding RNA; • Families of DNA binding transcription factors: Helix-turn-helix, helix-loop-helix, homeodomain; 2C 2H zinc finger, multi cysteine zinc finger, basic DNA binding domains (leucine zipper, helix-loop-helix), nuclear receptors. • Interaction of regulatory transcription factors with DNA: properties and mechanism of activation and repression including Ligand-mediated transcription regulation by nuclear receptors. • DNA replication. • DNA recombination. 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Reading</u>	<ol style="list-style-type: none"> 1. RF Weaver Molecular Biology 5th edition (2012) McGraw Hill Higher Education 2. <u>Learning Outcomes</u>	The students should be able to explain and summarize the scientific principles of the molecular biology of DNA,RNA and understand the role played in overall functioning of the cell.	

Programme: M. Sc. Biotechnology

Course Code: GBC-184

Title of the Course: Biophysical Principles &

Analytical Techniques

Number of Credits:2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The course is designed to provide a broad exposure to basic techniques used in Modern Biology research. The goal is to impart basic conceptual understanding of principles of these techniques and emphasize biochemical utility of the same. Student is expected to have a clear understanding of all analytical techniques such that the barrier to implement the same is abated to a great extent.	
<u>Content:</u>	MODULE I Nucleic Acid, Protein-Polymer Description of Macromolecular Structure, Intermolecular and Intramolecular forces, Non Covalent Interaction; Hydrodynamic properties: Diffusion and sedimentation, determination of molecular weight from sedimentation	12 hours

	<p>and diffusion; Concept and application of Chemical and Physical equilibria in Biological system</p> <p>Physical biochemistry of cell: Chemical forces translation and rotation, diffusion, directed movements, biomolecules as machines, work, power and energy, thermal, chemical and mechanical switching of biomolecules, Responses to light and environmental cues; Biochemical and biophysical characterizations of the purified protein: Purified protein will be assayed for its biological activity, (Fluorescence from GFP), UV-VIS absorption and emission spectra resulting from intrinsic Tryptophan and GFP chromophores, Fluorescence quenching and polarization studies, Unfolding and refolding studies using CD and fluorescence methods, Fluorescence correlation spectroscopy experiment to measure the protein diffusion and hydrodynamic size, Atomic force microscopy of plasmid DNA.</p> <p>MODULE II</p> <p>Spectroscopic properties of proteins and nucleic acid: UV/Vis, Intrinsic fluorescence, Circular dichroism. Double Strand formation in nucleic acid, Ligand-protein binding, Protein denaturation and stability, Introduction of DSC and ITC; Protein folding kinetics and Biophysical methods, Misfolding and aggregation; Physical basis of conformation diseases; Introduction to basic principles of protein X-ray crystallography, protein NMR, Small Angle X-ray scattering (SAXS), Cryo-EM, Graphics and structural validation, Structural databases, Other biophysical and spectroscopic techniques to understand conformations of biomolecules; Mass Spectroscopy: Ionization techniques; mass analyzers/overview MS.</p>	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<p>C.R. Cantor and P.R. Schimmel (1982) Biophysical Chemistry (Part1-3), 2nd Edn.</p> <ol style="list-style-type: none"> 1. Tinoco, Sauer, Wang, and 	

	Puglisi. (2013) Prentice Hall, Inc. 3. Physical Chemistry for the Life Sciences (2nd Revised Edition). Atkins, de Paula. (2015). 4. Biophysical Chemistry, Allen Cooper, (2011), Royal Society of Chemistry 5. Principles of Physical Biochemistry, K. E. van Holde, C. Johnson, P. S. Ho. (2010) 3rd Edn., Prentice Hall	
<u>Learning Outcomes</u>	Students will learn to combine previously acquired knowledge of physics and chemistry to understand the biochemical processes in the cell.	

Programme: M. Sc. Biotechnology

Course Code:GBC-185

Title of the Course: Introductory Immunology

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Basic knowledge of biochemistry and cell biology.	
<u>Objective:</u>	to provide a basic knowledge and to appreciate the components of the human immune response that work together to protect the host. 2) To understand the concept of immune-based diseases as either a deficiency of components or excess activity as hypersensitivity 3) To gain an insight into the mechanisms that lead to beneficial immune responses, immune disorders, and immune-deficiencies.	
<u>Content:</u>	MODULE I – Concepts and Basics <ul style="list-style-type: none"> • Introduction – History and scope of immunology • Innate immunity:- factors, features, processes • Acquired:- the Specificity, memory, recognition of self from non-self. • Cells of the immune system: Hematopoiesis and differentiation, Lymphoid and Myeloid lineage, lymphocyte trafficking, B lymphocytes, T lymphocytes, macrophages, dendritic cells, natural killer and lymphokine-activated killer cells, eosinophils and mast cells, lymphocyte subpopulations and CD markers. • Organization of lymphoid organs 	12 hours

	<ul style="list-style-type: none"> • MALT, GALT, SALT <p>MODULE II – Defence Components: Constituents of immune system and response</p> <ul style="list-style-type: none"> • Theories of antibody formation and resolution of antibody structure • Humoral immunity: cells, antibody formation, primary and secondary response. • Immunoglobulins – structure, distribution and function. • Antigen – Antibody interactions: forces, affinity, avidity, valency and kinetics. • Immuno-diagnostics..the basis • Nature and biology of antigens and superantigens: haptens, adjuvants, carriers, epitopes, T dependant and T independent antigens. • Antigen elimination <i>in vivo</i> <p>MODULE III – Defence Strategies and Pitfalls: Effector mechanisms of immune responses</p> <ul style="list-style-type: none"> • Complement system: mode of activation, classical, alternate and MBL pathways. Structures of key components. • Cell mediated immune responses: cell activation, cell-cell interaction and cytokines. • Cell-mediated cytotoxicity: Mechanism of T cell and NK cell mediated lysis, antibody-dependant cell-mediated cytotoxicity, and lectin-mediated cytotoxicity. Phagocytosis: oxygen-dependant/independent killing intracellularly. • Hybridoma technology and monoclonal antibodies. • Major histocompatibility complex...Structure of MHC molecules, basic organization of MHC in human , haplotype-restricted killing. • Hypersensitivity: An introduction to the different types. <p>Introduction to autoimmune diseases.</p>	<p>12 hours</p> <p>12hours</p>
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	

<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Essential Immunology (2005) Roitt I.M. and Delves P.J. 2. Essential Immunology (2011) Delves P J., Martin S. J., Burton D R, Roitt I.M. 3. Immunology (2001) Roitt I, Bostoff J. & Male D.6th edition 4. Immunology (2006) Luttmann M, Bratke K., Kupper M., & Myrtek D 5. Immunology (2007) Goldsby R.A., Kindt T.J., Osbrne B.A and Kuby J. 	
<u>Learning Outcomes</u>	The mode of continuous assessment and formulation of tests enables students to handle competitive entrance exams. The basic overview of Immunology strengthens their foundations for a career in Biotechnology.	

Programme: M. Sc. Biotechnology

Course Code:GBC-187

Title of the Course: Cell Biology

Number of Credits:2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The cells being “the fundamental building blocks of all organisms”, a comprehensive understanding of the cell and cellular function is essential for all biologists. This course will hence provide a conceptual overview of cellular system and functioning in animals and plants.	
<u>Content:</u>	<p>MODULE I</p> <ul style="list-style-type: none"> • Biochemical organization of the cell; diversity of cell size and shape; cell theory, the emergence of modern Cell Biology. • Principles underlying microscopic techniques for study of cells: Light, Phase contrast and interference, Fluorescence, Confocal, Electron (TEM and SEM), Electron tunneling and Atomic Force Microscopy. • Structure and diversity of biological membranes; 	12 hours

	<p>mechanisms of membrane transport. Self-assembly of lipids, micelle, biomembrane organization - sidedness and function; membrane assembly.</p> <ul style="list-style-type: none"> • Cell lysis and subcellular fractionation • Mitochondria and chloroplasts: ultrastructure and functional compartmentalization, biogenesis and organellar genome • Structure and function of microbodies, Golgi apparatus, Lysosomes and Endoplasmic Reticulum; • Nucleus – Structure and function of nuclear envelope, lamina and nucleolus; Macromolecular trafficking. • Cellular junctions and adhesions in animal cells; structure and functional significance of plasmodesmata. <p>MODULE II</p> <ul style="list-style-type: none"> • Organization and role of microtubules and microfilaments; Cell shape and motility; Actin-binding proteins and their significance; Muscle organization and function; Molecular motors; Intermediate filaments. • Protein localization – synthesis of secretory and membrane proteins, import into nucleus, mitochondria, chloroplast and peroxisomes, receptor-mediated endocytosis. • The plant cell wall; extracellular matrix in plants and animals • The eukaryotic cell cycle and its regulation • Molecular aspects of cell division • Cell signaling • Cell fusion techniques • Molecular chaperones: types, characteristics and functional significance • Proteosomes; structure and function • Differentiation of cancerous cells; role of growth factors, proto-oncogenes and signal transduction mechanisms in tumour formation • Oncogenes and tumour suppressor genes 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	

<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Lodish et al., (2000) Molecular Cell Biology, (4th edition) , W.H.Freeman & Company 2. <u>Learning Outcomes</u>	Understand major concepts in cell biology with an awareness of experimental approaches and how they are applied in cell biology research.	

Programme: M. Sc. Biotechnology

Course Code:GBC-188

Title of the Course: Biostatistics

Number of Credits:2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The objective of this course is to introduce students to statistical methods and to understand underlying principles, as well as practical guidelines of “how to do it”	

	and “how to interpret it” statistical data.	
<u>Content:</u>	<p>MODULE I</p> <ol style="list-style-type: none"> 1. Scope of Biostatistics 2. Brief description and tabulation of data and its graphical representation, frequency distributions 3. Measures of Central Tendency and dispersion: mean, median, mode, range, standard deviation, variance, coefficient of variation, skewness, kurtosis 4. Displaying data: Histograms, stem and leaf plots, box plots 5. Probability analysis: axiomatic definition, axioms of probability: addition theorem, multiplication rule, conditional probability and applications in biology. <p>MODULE II</p> <ol style="list-style-type: none"> 6. Counting and probability, Bernoulli trials, Binomial distribution and its applications, 7. Poisson distribution 8. Normal distribution, z, t and chi square tests, levels of significance 9. Testing of hypotheses: null and alternative hypothesis, Type I and Type II errors 10. Simple linear regression and correlation 11. Analysis of variance 	<p>12 hours</p> <p>12 hours</p>
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Jaype Brothers, (2011), Methods in Bioastatistics for Medical Students and Research Workser (English), 7th Edition. 2. Norman T.J. Bailey, (1995), Statistical Methods in Biology, 3rd Edition, Cambridge University Press 3. P.N. Arora and P.K. Malhan, (2006), Bioastatistics, 2nd Edition, Himalaya Publishing House. 4. Samuels, JA Witmer (2003) Statistics for the Life Sciences, 3rd edition. Prentice Hall 	

<u>Learning Outcomes</u>	<p>Upon completing of this course, students should be able to</p> <p>-</p> <ul style="list-style-type: none"> • understand how to summarise statistical data; • apply appropriate statistical tests based on an understanding of study question, type of study and type of data; • interpret results of statistical tests. 	
---------------------------------	---	--

Programme: M. Sc. Biotechnology

Course Code:GBC 191
and Immunology

Title of the Course: Lab I: Techniques in Microbiology

Number of Credits:3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	This course involves learning techniques to culture microbes and to identify immune reactions in the lab to form the basis for application in microbiology and immunodiagnostics.	
<u>Content:</u>	<p>MODULE I</p> <ul style="list-style-type: none"> • Sterilization and disinfection. • Preparation of solid & liquid media: • Isolation and maintenance of organisms: Streaking, slants and stabs cultures, storage of microorganisms. • Differential and Selective media • Enumeration: serial dilution methods, plating. • Isolation of bacteria from seawater /sediments samples • Study of morphology and cultural characteristics • Gram staining. 	36 hours

	<ul style="list-style-type: none"> • Motility • Antimicrobial sensitivity test and demo of drug resistance • Cultivation of fungi: Slide,chunk and coverslip techniques <p>Module II</p> <ul style="list-style-type: none"> • Determination of Antibody titer using Double Immuno-diffusion • Assesment of Similarity between antigens using Ouchterlony's Double diffusion Test • Estimation Of Antigen Concentration using Radial Immuno Diffusion • Quantative Precipitation Assay • DOT ELISA • Latex Agglutination • Immunoelectrophoresis • Rocket Immunoelectrophoresis 	36 hours
<u>Pedagogy:</u>	lectures/ tutorialsassignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Laboratory Manual in General Microbiology(2017) Giltner W. Creative Media Partners,LLC 2. Laboratory Methods in Microbiology (2014) Harrigan W. F., McCance M E. Academic Press 3. Handbook of Techniques in Microbiology: A Laboratory Guide to Microbes (2012) Karwa A.S., Rai M.K, Singh H.B. 4. Practical Immunology (2008) Frank C.Hay & O.M.R. Westwood. 4 th edition 5. Manual of Molecular and Clinical Laboratory Immunology (2016) Detrick B., Hamilton R.G. & Folds J.D. ASM Press. 	
<u>Learning Outcomes</u>	Key hands-on experience of converting and applying theoretical knowledge to laboratory. Application of the varied interactions /reactions to be utilized in research. Students become familiar with microbiology and immunologic techniques that are used in many scientific disciplines as well as clinical medicine.	

Programme: M. Sc. Biotechnology

Course Code: GBC-192

Title of the Course: Lab II - Biochemical & Analytical Techniques

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The objective of this laboratory course is to introduce students to experimentation in biochemistry. The course is designed to teach the utility of these experimental methods in a problem-oriented manner.	
<u>Content:</u>	<ol style="list-style-type: none">1. Principles of colorimetry and experimental significance of the Beer-lambert Law2. Estimation of proteins by the Lowry's method3. Spectral characteristics of coloured solutions and UV absorption of proteins4. Estimation of reducing sugars.5. Titration curves of di- and tri- protic amino acids6. Paper chromatography.7. Ammonium sulphate precipitation and dialysis8. Protein subunit molecular weight determination by SDS-PAGE9. Column chromatographic techniques10. Analysis of a biological specimen by SEM11. Fluorescence microscopy12. Demonstration of fluorescence spectroscopy13. Demonstration of mass spectrometry14. Demonstration of FT-IR/XRD	72 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	

<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Modern Experimental Biochemistry (2003). Boyer, R. Principles and Techniques of Biochemistry and Molecular Biology (2005). <u>Learning Outcomes</u>	<p>Students should be able to:</p> <ul style="list-style-type: none"> • elaborate concepts of biochemistry with easy-to-run experiments. • familiarize with basic laboratory instruments and understand principles underlying measurements using those instruments for experiments in biochemistry. 	

Programme: M. Sc. Biotechnology

Course Code: GBC-193
Genetic Engineering

Title of the Course: Lab III - Molecular Biology &

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The objectives of this course are to provide students with the experimental knowledge of molecular biology and genetic engineering.	

<u>Content:</u>	1. UV mutagenesis to isolate amino acid auxotroph. 2. Transduction 3. Phage titre with λ phage/M13. 4. Genetic Transfer-Conjugation, gene mapping. 5. Plasmid DNA isolation and DNA quantification. 6. Restriction Enzyme digestion of plasmid DNA. 7. Genomic DNA and RNA isolation 8. Polymerase Chain reaction. 9. Cloning of insert in to a plasmid vector 10. Transformation of <i>E.coli</i> with standard plasmids, Calculation of transformation efficiency. 11. Confirmation of the insert by Colony PCR and Restriction mapping 12. Expression of recombinant protein, concept of soluble proteins and inclusion body formation in <i>E.coli</i> , SDS-PAGE analysis 13. Purification of His-Tagged protein on Ni-NTA columns 14. Southern hybridization.	72 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	1. Biotechnology. (1998). Singh, B.D. 2. Genetic engineering: principles & practice (1996). Mitra, S. 3. <u>Learning Outcomes</u>	Students should be able to gain hands-on experience on gene cloning, protein expression and purification. This experience would enable them to begin a career in industry.	

Programme: M. Sc. Biotechnology

Course Code: GBC-280

Title of the Course: Genetic Engineering

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Course in Molecular Biology	
<u>Objective:</u>	To explain the various tools that are used in genetic engineering to create recombinants and its applications in biological research as well as in biotechnology industries.	
<u>Content:</u>	<p>MODULE I</p> <p>Enzymes used in Molecular biology: restriction endonucleases and methylases; DNA ligase, Klenow enzyme, T4 DNA polymerase, polynucleotide kinase, alkaline phosphatase; nucleases, Topoisomerase, thermostable polymerase, Terminal deoxynucleotide polymerase and others.</p> <p>cohesive and blunt end ligation; linkers; adaptors; homopolymer tailing; labelling of DNA: nick translation,</p> <p>Random priming, radioactive and non-radioactive probes,</p> <p>Hybridization techniques: northern, southern, south-western and far-western and colony hybridization, fluorescence <i>in situ</i> hybridization.</p> <p>Plasmids; Bacteriophages; M13mp vectors; pUC19 and pBluescript vectors, phagemids; Lambda vectors; Insertion and Replacement vectors; Cosmids; Artificial chromosome vectors (YACs; BACs); Principles for maximizing gene expression vectors; pMal; GST; pET-based vectors; Protein purification; His-tag; GST-tag; MBP-tag <i>etc.</i>; Intein-based vectors; Inclusion bodies; methodologies to reduce formation of inclusion bodies; mammalian expression and replicating vectors;</p> <p>Baculovirus and <i>Pichia</i> vectors system,</p> <p>Plant based vectors, Ti and Ri as vectors, yeast vectors, shuttle vectors.</p>	12 hours

	<p>MODULE II</p> <p>Principles of PCR: primer design; fidelity of thermostable enzymes; DNA polymerases; types of PCR – multiplex, nested; real time PCR, touchdown PCR, hot start PCR, colony PCR, cloning of PCR products; T - vectors; proof reading enzymes; PCR based site specific mutagenesis; PCR in molecular diagnostics; viral and bacterial detection; Sequencing methods; enzymatic DNA sequencing; chemical sequencing of DNA; automated DNA sequencing; RNA sequencing; chemical synthesis of oligonucleotides; mutation detection: SSCP, DGGE, RFLP.</p> <p>Insertion of foreign DNA into host cells; transformation, electroporation, transfection; construction of libraries; isolation of mRNA and total RNA; reverse transcriptase and cDNA synthesis; cDNA and genomic libraries; construction of microarrays – genomic arrays, cDNA arrays and oligo arrays; study of protein - DNA interactions: electrophoretic mobility shift assay; DNase I footprinting; methyl interference assay, chromatin immunoprecipitation; protein-protein interactions using yeast two-hybrid system; phage display.</p> <p>MODULE III</p> <p>Gene silencing techniques; introduction to siRNA; siRNA technology; Micro RNA; construction of siRNA vectors; principle and application of gene silencing; gene knockouts and gene therapy; creation of transgenic plants; debate over GM crops; introduction to methods of genetic manipulation in different model systems <i>e.g.</i> fruit flies (<i>Drosophila</i>), worms (<i>C. elegans</i>), Frog (<i>xenopus</i>), fish (zebra fish) and chick;</p> <p>Transgenics - gene replacement; gene targeting; creation of transgenic and knock-out mice; disease model; introduction to genome editing by CRISPR-CAS with specific emphasis on Chinese and American clinical trials;</p> <p>Cloning genomic targets into CRISPR/Cas9 plasmids; electroporation of Cas9 plasmids into cells;</p>	<p>12 hours</p> <p>12 hours</p>
--	--	---------------------------------

	<p>purification of DNA from Cas9 treated cells and evaluation of Cas9 gene editing; <i>in vitro</i> synthesis of single guide RNA (sgRNA); using Cas9/sgRNA complexes to test for activity on DNA substrates; evaluate Cas9 activity by T7E1 assays and DNA sequence analysis; Applications of CRISPR/cas9 technology</p>	
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study

<u>Learning Outcomes</u>	Given the impact of genetic engineering in modern society, students should be endowed with strong theoretical knowledge of this technology. In conjunction with the practicals in molecular biology & genetic engineering, the students should be able to take up biological research as well as placement in the relevant biotech industry.	

Programme: M. Sc. Biotechnology

Course Code: GBC-281

Title of the Course: Bioprocess Technology

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Courses in Microbiology and Biochemistry	
<u>Objective:</u>	The objective of this course are to educate students about fundamental concepts of bioprocess technology and its related applications, thus, preparing them to meet challenges of new and emerging areas of biotechnology industry.	
<u>Content:</u>	<p>MODULE I</p> <p>Basic Principles of Biochemical Engineering and Fermentation Processes:</p> <ul style="list-style-type: none"> • Isolation, screening, and preservation of industrially important microbes • Bioreactor designs • Types of fermenters • Concepts of basic modes of fermentation: batch, fed-batch and continuous • Scale up fermentation processes • Media formulation 	12 hours

	<ul style="list-style-type: none"> • Air and media sterilization. • Aeration & agitation in bioprocess. • Measurement and control of bioprocess parameters. <p>MODULE II</p> <p>Industrial production of chemicals:</p> <ul style="list-style-type: none"> • Strain improvement for increased yield & other desirable characteristics • alcohol (beer) • organic acids (citric acid) • antibiotics (Penicillin) • amino acids (lysine) • Application of microbes in food processing: manufacture of cheese and monosodium glutamate <p>MODULE III</p> <p>Downstream Processing:</p> <ul style="list-style-type: none"> • introduction, removal of microbial cells & solids • bioseparation, filtration, centrifugation sedimentation. • flocculation, cell disruption, liquid-liquid extraction, • Purification by chromatographic techniques • Drying, crystallization. • Storage & Packaging • Effluent treatment & disposal. • Immobilization of microbial cells & their applications • Bioprocess for the production of biomass: yeast and mushrooms 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Encyclopedia of bioprocess technology. Vol 1-5. (1999). Flickinger, M.C. & Drew, S.W.(Ed). 2. Fermentation technology. (1994). Biosorption: current perspectives on concept, definition and application. Bioresource technology, 160, 3-14. 	
<u>Learning Outcomes</u>	<p>On completing of this course, students should be able to:</p> <ul style="list-style-type: none"> • appreciate relevance of microorganisms from industrial context; • carry out stoichiometric calculations and specify models of their growth; • give an account of design and operations of various fermenters; • present unit operations together with fundamental principles for basic methods in production techniques for bio-based products; • calculate yield and production rates in biological production process, and also interpret data; • give an account of important microbial/enzymatic industrial processes in the industry. 	

Programme: M. Sc. Biotechnology

Course Code: GBC-283

Title of the Course: Lab V-Cell and Tissue Culture

Number of Credits: 2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Course in cell biology	
<u>Objective:</u>	A comprehensive understanding of the cell and cellular functions; plant and animal tissue culture.	
<u>Content:</u>	<ol style="list-style-type: none">1. Preparation of starting material (Biosafety cabinet, solutions, media, cell sample etc.): Cell stock preparation (glycerol stock), storage, freezing, thaw and subculture, contamination and precautions2. Animal cell culture: Secondary cell culture HeLa and non-cancerous cell like HEK293, COS-73. Transfection and co-transfection: Calcium-phosphate method and Lipofection4. Cell fixation and staining: Immunolabeling, mounting, fluorescence imaging5. Tissue culture medium, contamination and precautions in plant tissue culture6. Callus induction and plantlet regeneration7. Single cell suspension and Protoplast isolation	48 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none">1. Animal cell culture (2000) – A Practical Approach John R.W. Masters2. Culture of animal cells – A manual of Basic techniques (2005) R.I. Freshney3. Plant tissue culture, 3rd edition (2012) – Techniques and experiment, R. Smith	
<u>Learning Outcomes</u>	To carry out and interpret experiments in Plant and animal tissue culture .	

Programme: M. Sc. Biotechnology

Title of the Course: Fundamental microbiology

Effective from AY: 2019-202028

Programme: M. Sc. Biotechnology

Course Code: GBO-186

Title of the Course: Field Trip and Report

Number of Credits: 1

Effective from AY: 2019-2020

Programme: M. Sc. Biotechnology

Course Code: GBO-187

Title of the Course: IPR, Biosafety And Bioethics

Number of Credits: 2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	<p>To provide basic knowledge on intellectual property rights and their implications in biological research and product development;</p> <ul style="list-style-type: none"> • To become familiar with India's IPR Policy; • To learn biosafety and risk assessment of products derived from biotechnology and regulation of such products; • To become familiar with ethical issues in biological research. This course will focus on consequences 	

	of biomedical research technologies such as cloning of whole organisms, genetic modifications, DNA testing.	
<u>Content:</u>	<p>MODULE I</p> <p>Introduction to intellectual property; types of IP: patents, trademarks, copyright & related rights, industrial design, traditional knowledge, geographical indications, protection of new GMOs; International framework for the protection of IP; IP as a factor in R&D; IPs of relevance to biotechnology and few case studies; introduction to history of GATT, WTO, WIPO and TRIPS; plant variety protection and farmers rights act; concept of ‘prior art’: invention in context of “prior art”; patent databases - country-wise patent searches (USPTO, EPO, India); analysis and report formation.</p> <p>Basics of patents: types of patents; Indian Patent Act 1970; recent amendments; WIPO Treaties; Budapest Treaty; Patent Cooperation Treaty (PCT) and implications; procedure for filing a PCT application; role of a Country Patent Office; filing of a patent application; precautions before patenting-disclosure/non-disclosure - patent application- forms and guidelines including those of National Bio-diversity Authority (NBA) and other regulatory bodies, fee structure, time frames; types of patent applications: provisional and complete specifications; PCT and conventional patent applications; international patenting-requirement, procedures and costs; financial assistance for patenting-introduction to existing schemes; publication of patents-gazette of India, status in Europe and US; patent infringement- meaning, scope, litigation, case studies and examples; commercialization of patented innovations; licensing – outright sale, licensing, royalty; patenting by research students and scientists-university/organizational rules in India and abroad, collaborative research - backward and forward IP; benefit/credit sharing among parties/community, commercial (financial) and non-commercial incentives.</p> <p>MODULE II</p>	12 hours

	<p>Biosafety and Biosecurity - introduction; historical background; introduction to biological safety cabinets; primary containment for biohazards; biosafety levels; GRAS organisms, biosafety levels of specific microorganisms; recommended biosafety levels for infectious agents and infected animals; definition of GMOs & LMOs; principles of safety assessment of transgenic plants – sequential steps in risk assessment; concepts of familiarity and substantial equivalence; risk – environmental risk assessment and food and feed safety assessment; problem formulation – protection goals, compilation of relevant information, risk characterization and development of analysis plan; risk assessment of transgenic crops vs cisgenic plants or products derived from RNAi, genome</p> <p>International regulations – Cartagena protocol, OECD consensus documents and Codex Alimentarius; Indian regulations – EPA act and rules, guidance documents, regulatory framework – RCGM, GEAC, IBSC and other regulatory bodies; Draft bill of Biotechnology Regulatory authority of India - containments – biosafety levels and category of rDNA experiments; field trails – biosafety research trials – standard operating procedures - guidelines of state governments; GM labeling – Food Safety and Standards Authority of India (FSSAI).</p> <p>Introduction, ethical conflicts in biological sciences - interference with nature, bioethics in health care - patient confidentiality, informed consent, euthanasia, artificial reproductive technologies, prenatal diagnosis, genetic screening, gene therapy, transplantation. Bioethics in research – cloning and stem cell research, Human and animal experimentation, animal rights/welfare, Agricultural biotechnology - Genetically engineered food, environmental risk, labeling and public opinion. Sharing benefits and protecting future generations - Protection of environment and biodiversity – biopiracy.</p>	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study

<u>Learning Outcomes</u>	<p>On completion of this course, students should be able to:</p> <ul style="list-style-type: none"> • understand the rationale for and against IPR and especially patents; • understand why India has adopted an IPR Policy and be familiar with broad outline of patent regulations; • understand different types of intellectual property rights in general and protection of products derived from biotechnology research and issues related to application and obtaining patents; • gain knowledge of biosafety and risk assessment of products derived from recombinant DNA research and environmental release of genetically modified organisms, national and international regulations. 	

Programme: M. Sc. Biotechnology

Course Code: GBO-188

Title of the Course: Bioentrepreneurship

Number of Credits: 2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	Research and business belong together and both are needed. In a rapidly developing life science industry, there is an urgent need for people who combine business knowledge with the understanding of science & technology. Bio-entrepreneurship, an interdisciplinary course, revolves around the central theme of how to manage and develop life science companies and projects. The objectives of this course are to teach students about concepts of entrepreneurship including identifying a winning business opportunity, gathering funding and launching a business, growing and nurturing the organization and harvesting the rewards.	
<u>Content:</u>	MODULE I Finance and Marketing Taking decision on starting a venture; Assessment of feasibility of a given venture/new venture; Approach a bank for a loan; Sources of financial assistance; Making a business proposal/Plan for seeking loans from financial institution and Banks; Funds from bank for capital expenditure and for working; Statutory and legal requirements for starting a company/venture; Budget planning and cash flow management; Negotiations/Strategy With financiers, bankers etc.; With government/law enforcement authorities; With companies/Institutions for technology transfer Assessment of market demand for potential product(s) of interest; Market conditions, segments; Prediction of	12 hours

	<p>market changes; Identifying needs of customers including gaps in the market, packaging the product; Market linkages, branding issues; Developing distribution channels; Pricing/Policies/Competition; Promotion/ Advertising; Services Marketing Dispute resolution skills.</p> <p>MODULE II</p> <p>Fundamentals of Entrepreneurship Support mechanism for entrepreneurship in India Role of knowledge centre and R&D Knowledge centres like universities and research institutions; Role of technology and upgradation; Assessment of scale of development of Technology; Managing Technology Transfer; Regulations for transfer of foreign technologies; Technology transfer agencies. E-business setup, management. Human Resource Development (HRD) Leadership skills; Managerial skills; Organization structure, pros & cons of different structures; Team building, teamwork; Appraisal; Rewards in small scale set up. External environment/changes; Crisis/ Avoiding/Managing; Broader vision–Global thinking.</p>	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Adams, D. J., & Sparrow, J. C. (2008). Enterprise for Life Scientists: Developing Innovation and Entrepreneurship in the Biosciences. <u>Learning Outcomes</u>	Students should be able to gain entrepreneurial skills, understand the various operations involved in venture creation, identify scope for entrepreneurship in biosciences and utilize the schemes promoted through knowledge centres and various agencies. The knowledge pertaining to management should also help students to be able to build up a strong network within the industry.	

Programme: M. Sc. Biotechnology

Course Code: GBO-189

Title of the Course: Cellular Biophysics

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The course will provide 1) knowledge of the fundamental physical principles for the electrical properties of living cells and models describing membrane and action potentials. 2) an understanding of how potentials are generated across the membranes of cells and what these potentials do.	
<u>Content:</u>	MODULE I 1) Overview of the Cellular organization of the nervous system: <ul style="list-style-type: none"> • Typical nerve cell • Types of cells: Neuronal, Glial cells, ependymal cells and Schwann cells. • Classification and types of neurons , cytons and axons • Function of nerve cells 2) Ion Channels <ul style="list-style-type: none"> • Sodium channels 	12 hours

	<ul style="list-style-type: none"> • Potassium channels • Calcium channels <p>3) Potentials of excitable cells</p> <p>Biophysics of nerve cells:</p> <ul style="list-style-type: none"> • Electrical properties of the axon, ion fluxes, potentials of nerve cell membrane Resting membrane potential • Chemical –to- electrical transduction • Signal summation • Action Potential and propagation(a) Hodgkin and Huxley’s model, voltage clamp experiment and the derivation and propagation of Action Potential • Compound Action potential • Sodium and Potassium ionic currents • Nernst’s potential, Goldman’s equation, Sodium–potassium pump. • Transmission of nerve impulse <p>MODULE II</p> <p>Communication between neurons:</p> <ul style="list-style-type: none"> • Types of synapses and synaptic transmission (electrical and chemical) • Synaptic transmission through second messenger (including mechanism of signal transduction, Neuromodulation and synaptic inhibition . • Electrical- to- chemical Transduction (a) Graded potential (b) Synaptic potential and synaptic integration [Electrical and Chemical Synaptic Potential, Excitatory Post Synaptic Potential (EPSP) Inhibitory Post Synaptic Potential (IPSP), Neuro-muscular junctions, Summation and facilitation. Spike potential • Neurotransmitter –physiological role, pharmacological significance, (example of one agonist and one antagonist for a neurotransmitter) Acetylcholine (Nicotinic and muscarinic receptors) <p>MODULE III</p>	12 hours
--	---	----------

	<ul style="list-style-type: none"> • Muscle- structure and electro-physiology of contraction. Spike potential Muscle contraction...Cross-bridge theory. Calcium channels. Repolarisation. • Visual system: Vertebrate eye and retina. Morphology and arrangement of photoreceptors, Electrical response to light. Concept of receptive fields. Colour vision. • Organisation of the nervous system in Marine organisms: Structure of nerve net, neural plexus, an ganglionated nervous system e.g. hydra, starfish, and <i>Aplysia</i>. • Type study in behavior of <i>Aplysia</i>: elementary behavior, neuroendocrine reflexes, complex behavior; higher grade and learned behavior. Synaptic plasticity. 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Introductory Biophysics , V. Pattabhi & N. Gautham, Narosa Publications 2. Ionic Channels of Excitable Membranes, Third Edition. <u>Learning Outcomes</u>	It will equip the student with a broad perspective of integrating physics with biology at the cellular level with detailed information to pursue a career in newly evolving and dynamic fields of Neurobiology.	

Programme: M. Sc. Biotechnology

Course Code: GBO-190

Title of the Course: Environment Biotechnology

Number of Credits: 2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The objective of this course is to impart knowledge on biotechnological applications that can be used to tackle environmental issues emerging due to industrialization and globalization.	
<u>Content:</u>	<p><u>MODULE I</u></p> <p>Environment pollution, Hazardous wastes: Definition, sources and characteristics: Hazardous waste categorization, generation, collection, transport, treatment and disposal; Collection, segregation and transport of solid wastes handling and segregation of wastes at source. Collection and storage of municipal solid wastes. Solid waste processing technologies. Waste water collection; control and management; Waste water treatment from dairy, distillery, sugar and antibiotic industries; Sewage treatment through chemical, microbial and biotech techniques; Anaerobic processes; Anaerobic filters; Anaerobic sludge blanket reactors.</p> <p><u>MODULE II</u></p> <p>Bioremediation of organic pollutants, contaminated soil, ground water; Use of bacteria, fungi, plants, enzymes, and GE organisms; Bioaugmentation; Macrophytes in water treatment; Phytoremediation of soil metals; Bioreactors; Rural biotechnology; Biocomposting; Biofertilizers; Vermiculture; Organic farming; Bio-mineralization;</p>	<p>12 hours</p> <p>12 hours</p>

	Biomass as source of energy; Biofuels; Biodisel, environmental toxicants and human health; Nano materials: their properties and influence on human health, environment, Gene mutation; Genetic testing; Genetic sensors.	
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. MetCalfe and Eddy Inc., Wastewater Engineering: Treatment, Disposal and Reuse”, 4 th Edition, McGraw HillBook Co., 2003 2. <u>Learning Outcomes</u>	On completion of this course, students should be able to Identify interaction between living organisms and environment and employ environmental pollution management technologies to come up with solutions against growing industrial pollution.	

Programme: M. Sc. Biotechnology

Course Code: GBO-281
Animal Biotechnology

Title of the Course: Advances in Plant and

Number of Credits:3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	No prerequisites required.	
<u>Objective:</u>	The course is designed to provide a comprehensive exposure to advances in animal and plant biotechnology. Student is expected to have a clear understanding of basic biotechnology techniques to learn recent advances in the	

	field.	
<u>Content:</u>	<p><u>Module I</u></p> <p>General features of eukaryotic expression and vector systems. Gene transfer to animal cells Transgenic mice methodologies, Transgenic poultry, Transgenic Fish, Embryo transfer technology, Gene targeting, Cloning live stock by nuclear transfer, Transgenic live stock, Ethics of cloning Disease resistant transgenics, animal models for disease study, Pharming, improving milk quality, improving traits, Xenografts, Toxological applications, knock outs</p> <p><u>Module II</u></p> <p>Strategies for Introducing Biotic and Abiotic Stress Resistance/Tolerance Bacterial resistance; Viral resistance; Fungal resistance; Insects and pathogens resistance; Herbicide resistance; Drought, salinity, thermal stress, flooding and submergence tolerance Genetic Engineering for Plant Architecture and Metabolism Seed storage proteins; Protein engineering; Vitamins and other value addition compounds; Source-sink relationships for yield increase; Post-harvest bioengineering; Plant architecture; Flowering behavior Plants as Biofactories Concept of biofactories; Fermentation and production of industrial enzymes, vitamins and antibiotics and other biomolecules; Cell cultures for secondary metabolite production; Production of pharmaceutically important compounds; Bioenergy generation</p> <p><u>Module III</u></p> <p>Models used in genetics and genomic studies Zebra fish and <i>A. Thaliana</i>. Plant and animal genetic resources; Animal and Plant breeders rights (PBRs) and farmers rights</p> <p>•</p>	<p>12 hours</p> <p>12 hours</p> <p>12 hours</p>
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study

<u>Learning Outcomes</u>	On successful completion of this course, students should be able to describe the basic science behind the properties of materials at a nanometre scale.	

Programme: M. Sc. Biotechnology

Course Code: GBO-286

Title of the Course: Developmental Biology

Number of Credits: 2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Courses in Cell Biology and Molecular Biology	
<u>Objective:</u>	This course will provide a conceptual overview of how developmental patterns arise. Using examples from different model systems regulatory networks involved are highlighted, aiming to project the molecular basis of developmental patterns.	
<u>Content:</u>	<p>MODULE I</p> <p>Germ cells and fertilization; embryogenesis as modelled through <i>Xenopus</i>.</p> <p>Cell fate & commitment – potency- concept of embryonic stem cells, differential gene expression, terminal differentiation, transdetermination.</p> <p>Laying of body axis planes; cellular polarity: differentiation of germ layers. Morphogens, gradients, concept of compartmentalization and fate mapping.</p> <p>Cellular movements and gastrulation (sea urchin as model system); mammalian development (mouse/rat model). Neurulation.</p> <p>Cell lineages and pattern formation- <i>Caenorhabditis</i> as a model system; concept of positional values; heterochronic genes and effects of their mutations.</p> <p>Apoptosis : concept, mechanism and physiological significance. The role of programmed cell death in developmental processes.</p> <p>Cell-cell communication in development; induction and competence; cascades of induction; paracrine factors.</p> <p>Signal transduction cascades; Fibroblast growth factor and the RTK pathway; the Hedgehog family; the Wnt family; the TGF-β superfamily.</p>	12 hours

	<p>Juxtacrine signaling; the Notch pathway; cross-talk between pathways.</p> <p>Maintenance of the differentiated state.</p> <p>MODULE II Organizational and functional hierarchy of developmental control genes; maternal and zygotic gene effects.</p> <p>Homeotic selector genes in <i>Drosophila</i>; concept of the homeobox and homeotic mutations; conceptual extrapolation to mammalian systems.</p> <p>Complications in mammalian development; extraembryonic structures; twins and embryonic stem cells; production of chimeric mice.</p> <p>The unique development of the human brain; adult neural stem cells.</p> <p>Post-embryonic development: metamorphosis, regeneration and aging; significance of Imaginal discs in <i>Drosophila</i>.</p> <p>Embryogenesis and early pattern formation in plants; Plant Meristem Organization and Differentiation-Organization of Shoot Apical Meristem(SAM); Organization of Root Apical Meristem (RAM); Pollen germination and pollen tube guidance; Phloem differentiation; Self-incompatibility and its genetic control.</p> <p>Role of nuclear–cytoplasmic interactions in development. Medical implications of developmental biology. Overview of developmental mechanisms of evolutionary change.</p>	12 hours

Course Code:GBO-287

Title of the Course: Genomics and Proteomics

Number of Credits:2

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Courses in Molecular Biology and Bioinformatics	
<u>Objective:</u>	The objectives of this course are to provide introductory knowledge concerning genomics & proteomics and their applications.	
<u>Content:</u>	<p>MODULE I</p> <p>Brief overview of prokaryotic and eukaryotic genome organization; extra-chromosomal DNA: bacterial plasmids, mitochondria and chloroplast. Genetic and physical maps; markers for genetic mapping; methods and techniques used for gene mapping, physical mapping, linkage analysis, cytogenetic techniques, FISH technique in gene mapping, somatic cell hybridization, radiation hybrid maps, <i>in situ</i> hybridization, comparative gene mapping.</p> <p>Human Genome Project, genome sequencing projects for microbes, plants and animals, accessing and retrieving genome project information from the web.</p> <p>Identification and classification of organisms using molecular markers- 16S rRNA typing/sequencing, SNPs; use of genomes to understand the evolution of eukaryotes, track emerging diseases and design new drugs;</p>	12 hours

	<p>determining gene location in genome sequence.</p> <p>MODULE II</p> <p>Aims, strategies and challenges in proteomics; proteomics technologies: 2D-PAGE, isoelectric focusing, mass spectrometry, MALDI-TOF, yeast 2-hybrid system, proteome databases.</p> <p>Transcriptome analysis for identification and functional annotation of gene, Contig assembly, chromosome walking and characterization of chromosomes, mining functional genes in the genome, gene function- forward and reverse genetics, gene ethics; protein-protein and protein-DNA interactions; protein chips and functional proteomics; clinical and biomedical applications of proteomics; introduction to metabolomics, lipidomics, metagenomics and systems biology.</p>	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Voet D, Voet JG & Pratt CW, Fundamentals of Biochemistry, 2nd Edition. Wiley 2006 2. Brown TA, Genomes, 3rd Edition. <u>Learning Outcomes</u>	A thorough understanding of the essential concepts of enzymology, with an awareness of the biotechnological potential of enzymes in various fields of application.	

Programme: M. Sc. Biotechnology

Course Code: GBO-289

Title of the Course: Molecular Immunology

Number of Credits: 3

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Courses in Introductory Immunology, Cell biology and Molecular Biology	
<u>Objective:</u>	The focus is on the key characteristics of immune system to recognize non-self from self...to remember structures and produce molecules that are highly specific to the foreign molecules. The course addresses in detail the different mechanisms that generate very large number of specific receptors that the immune system generates in response at the molecular level.	
<u>Content:</u>	<p>MODULE I</p> <p>Recognition of antigens</p> <p>1. The major histocompatibility complex:</p> <ul style="list-style-type: none"> • Discovery and its role in immune response • Structure of MHC molecules • Binding of peptides to MHC molecules • Genomic organization of the MHC <p>2. Recognition of antigens by T Lymphocytes</p> <ul style="list-style-type: none"> • Antigen processing and presentation to CD4⁺ and CD8⁺ T Lymphocytes. 	12 hours

	<ul style="list-style-type: none"> • Mechanisms of autoimmunity • Types of hypersensitivity diseases • Immunosuppression • Evasion of immune responses by pathogens 	
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Cellular and Molecular Immunology (2017) Abbas A.K. Lichtman A.H. & Pober, J.S. 9th Edition 2. Practical Immunology (2008) Frank C.Hay & O.M.R. Westwood 3. Immunology (2007) Goldsby R.A., Kindt T.J., Osbrne B.A and Kuby J. 4. Essential Immunology (2011) Delves P J., Martin S. J., Burton D R, Roitt I.M. 5. Immunology (2006) Luttmann M, Bratke K., Kupper M., & Myrtek D 6. Manual of Molecular and Clinical Laboratory Immunology (2016) Detrick B., Hamilton R.G. & Folds J.D. ASM Press. 	
<u>Learning Outcomes</u>	Will be theoretically equipped to develop strategies to manipulate the immune system, and its components to benefit the patient and design vaccines. It will prepare the students to engage further in this rapidly evolving field.	

Programme: M. Sc. Biotechnology

Course Code: GBO-290

Title of the Course: Stem Cell Biology

Number of Credits: 1

Effective from AY: 2019-2020

<u>Prerequisites for the course:</u>	Basic understanding of cell biology - cell types, growth media, cell division, cell growth, cell differentiation.	
<u>Objective:</u>	The aim of the course is to bring together cellular, biochemical, anatomical, histological, physiological and evolutionary medical views of stem cells to a coherent picture in an experimental and clinical context.	

<u>Content:</u>	MODULE I Definition, stem cell origins and plasticity, classification and source of stem cells; Stem cell differentiation; Stem cells cryopreservation, iPS technology; microRNAs and stem cell regulation, Tumor stem cells, Overview of embryonic and adult stem cells for therapy. Human stem cells research: Ethical considerations; Stem cell based therapies: Pre-clinical regulatory consideration and patient advocacy.	12 hours
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. The Molecular Biology of the cell. (2002). Albert et al. 2. Stem cells: From basic to advanced principles, John Collins, (2017). Hayle Medical 3. Essential of Stem cell Biology, Robert lanza, (2013) Elsvier publisher. 4. Principle of Tissue Engineering, Robert lanza, (2011), AP publisher 5. Robert Lanza (2006) Essential of Stem Cell Biology, 2 nd Edition, Academic Press. 9. A.D. Ho. R. Hoffman, (2006) Stem Cell Transplantation Biology Process Therapy, Willy-VCH 	
<u>Learning Outcomes</u>	On completion of the course, students should be aware of basics of stem cell function in the body and their usage in the medical context.	

Programme: M. Sc. Biotechnology

Course Code: GBO-381

Title of the Course: Dissertation

Number of Credits: 8

Effective from AY: 2019-2020

M.Sc. Botany Programme
(Choice Based Credit System- 64 Credits)

Course Structure

Course Number	Course Title	Credits
(CORE COURSES)		
BOC-121	Algae, Bryophytes, Pteridophytes and Gymnosperms	3
BOC-122	Lab in Algae, Bryophytes, Pteridophytes and Gymnosperms	1
BOC-123	Plant Microbiology and Pathology	3
BOC-124	Lab in Plant Microbiology and Pathology	1
BOC-125	Systematics of Angiosperms	3
BOC-126	Lab in Systematics of Angiosperms	1
BOC-221	Internal Morphology and Developmental Biology of Angiosperms.	3
BOC-222	Lab in Internal Morphology and Developmental Biology of Angiosperms	1
BOC-225	Plant Physiology	3
BOC-226	Lab in Plant Physiology	1
BOC-321	Plant Molecular Biology	3
BOC-323	Plant Genetic Engineering	3
BOC-324	Lab in Plant Molecular Biology and Genetic Engineering	2
BOC-421	Cytogenetics and Plant Breeding	3
BOC-422	Lab in Cytogenetics and Plant Breeding	1
(OPTIONAL COURSES)		
A student must choose at least 16 credits from the following		
BOO-121	Techniques and Instrumentation in Botany	3
BOO-122	Lab in Techniques and Instrumentation in Botany	1
BOO-123	Bioinformatics	2
BOO-124	Lab in Bioinformatics	1
BOO-125	Oenology (Wine Science and Technology)	1
BOO-126	Lab in Oenology (Wine Science and Technology)	1
BOO-127	Mine wasteland Management	2
BOO-128	Seed Science and Technology	2
BOO-129	Lab in seed Science and technology	1
BOO-221	Plant animal Interaction	4
BOO-224	Post Harvest Technology for Fruit Crops	2
BOO-225	Ethnobotany	2
BOO-226	Remote sensing: Techniques and applications	2
BOO-227	Lab in Remote sensing: Techniques and applications	1
BOO-329	Applied Phycology: Utilization and Management	3
BOO-322	Plant Biotechnology	3
BOO-323	Lab in Plant Biotechnology	1
BOO-324	Mycorrhizal Biotechnology	2

BOO-325	Lab in Mycorrhizal Biotechnology	1
BOO-326	Plant Histochemistry	2
BOO-327	Lab in Plant Histochemistry	1
BOO-328	Introduction to Paleoflora	1
BOO-436	Marine Phytoplanktons	1
BOO-440	Bioentrepreneurship and Innovation	1
BOO-441	Lab in Bioentrepreneurship and Innovation	1
BOO-442	Mushroom biotechnology	1
BOO-443	Lab in Mushroom biotechnology	1
BOO-447	Ecotourism	2
BOO-448	Lab in Ecotourism	2
BOO-449	Advanced Ecology	3
BOO-450	Lab in Advanced Ecology	1
BOO-451	Plant Biochemistry	3
BOO-452	Lab in Plant Biochemistry	1
BOO-453	Introduction to Omics	3
BOO-501	Fungal Chemistry and Mycoremediation	1
BOO-502	Lab in Fungal Chemistry and Mycoremediation	1
BOO-503	Glycobiology	1
BOO-504	Lab in Glycobiology	1
BOO-505	Fungal Biodiversity, Bioprospecting and Biotechnology	3
BOO-506	Lab in Fungal Biodiversity, Bioprospecting and Biotechnology	1
BOO-507	Mycological Techniques	3
BOO-508	Lab in Mycological Techniques	1
BO-DISS	Dissertation	8

Programme: M. Sc. (Botany)

Course Code: BOC-121

Title of the Course: Algae, Bryophytes, Pteridophytes and Gymnosperms.

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany.	
<u>Objective:</u>	To study general characteristics, classification, trends in classification, phylogeny and inter-relationships of Algae, Bryophyta, Pteridophyta and Gymnosperms.	
<u>Content:</u>	1. Algae: General introduction to algae: Classification of Algae; Recent trends in the classification of Algae; General account of morphology, anatomy, reproduction, life histories, classification, phylogeny and inter-relationship, ecological and economic importance of the following groups: Chlorophyta, Charophyta, Chrysophyta, Cryptophyta, Pyrrophyta, Phaeophyta and Rhodophyta	9 hours
	2. Bryophyta: Introduction to Bryophyta: General characteristics, classification; Distribution, morphological, anatomical, reproductive studies and comparative account of sporophytes and gametophytes and interrelationships of the following groups: Hepaticae: Sphaerocarpales, Calobryales, Takakiales, Marchantiales, Jungermanniales, Anthoceotae: Anthocerotales; Musci: Spagnales, Andaeales, Polytrichales, Buxbaumiales, Funariales including their fossil relatives	9 hours
	3. Pteridophyta: General characters and classification of Pteridophytes; Comparative account of Psilophyta, Lycophyta, Equisetophyta and Flicophyta; Aposory and Apogamy, Heterospory, Soral Evolution, Fossil Pteridophytes	9 hours
	4. Gymnosperms: General characters and Classification of Gymnosperms; Comparative account of Morphology, anatomy, phylogeny and interrelationships of Pro-Gymnospermopsida, Gymnospermopsida, Gnetopsida and Fossil Gymnosperms.	9 hours
<u>Pedagogy:</u>	Lectures/ Tutorials/Assignments/Self-Study

<u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. Students will have clear idea of the characteristics of the important plant groups taught in this paper. 2. Concepts in the evolution of plants will be clear to students. 	

Programme: M. Sc. (Botany)

Course Code: BOC-122

Title of the Course: Lab in Algae, Bryophytes, Pteridophytes and Gymnosperms.

Number of Credits: 1

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany.	
<u>Objective:</u>	To introduce and expose the students to skills required in field and lab based on theory.	

<u>Content:</u>	<ol style="list-style-type: none"> 1. Study of vegetative and reproductive features of important algal groups with the available representatives; Chlorophyta, Charophyta, Euglenophyta, Chrysophyta, Cryptophyta, Pyrrophyta, Phaeophyta, and Rhodophyta. 2. Study of vegetative and reproductive features of important bryophytes groups with the available representatives -Hepaticae, Anthocerotae and Musci. 3. Study of vegetative and reproductive features of important Pteridophyta groups with the available representatives: Psilotales Lycopodiales, Selaginallales Isoetales, Equisetales, Ophioglossales, Marattiales, Osmundales, Filicales, Marsileales and Salviniaceae 4. Vegetative and reproductive features of Gymnosperms and Angiosperms with available representatives. 	8 hours 6 hours 6 hours 4 hours
<u>Pedagogy:</u>	Conducting Practicals mostly with freshly collected and herbarium specimens, field visits, demonstrations, small projects, <i>etc.</i>	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Biswas C. and Johri B. M. (1997). Gymnosperms. Narosa Publishers, New Delhi. 2. Bold H.C. and Wynne M. J. (1985). 	Delhi. 14. Waston E. V. (1971). Structure and life of Bryophytes 3 rd Hutchinson University Library London.	
<u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. Able to understand technical description of plants and construct and use keys for identification.morphological, anatomical and reproductive characteristics of the respective plant groups. 2. Able to understand the concepts of the plant evolution. 3. Overall they will have better understanding in area of plant diversity and will be able to carry out research work in this field. 	

Programme: M. Sc. (Botany)

Course Code: BOC-123

Title of the Course: Plant Microbiology and Pathology.

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Knowledge of basic microbiology-bacteria, viruses, fungi and plant pathogens at UG level.	
<u>Objective:</u>	The aim of the course is, for students of botany, to understand the diversity and biology of fungi; microbial world, plant diseases and fundamental concepts needed to manage crop diseases. The paper covers mycology, microbiology and principles of plant pathology, with particular emphasis on identification of diseases and disease causative agents. Major scope is on understanding the fungi, microbiology, plant protection, and cultural, chemical and biological control of diseases. In the plant pathology component, the course will also deal with host-pathogen physiology, genetics, taxonomy of disease causing organisms, chemistry of fungicidal actions, etc. The students will understand fungi, microbes, the nature of plant diseases and their control practices	

<u>Content:</u>	<p>1. General Introduction: Plant microbe interactions in health and diseases and the changing picture due to climate change</p> <p>2. Plant Virology: Origin of viruses, introduction to molecular virology, Virology on Internet - viral databases and their use for understanding viral phylogeny, Viral genomics and proteomics; Viral nucleic acids, enzymes and proteins; classification and nomenclature of Viruses with special stress on plant viruses; modern techniques to study the viruses; Morphology, chemical composition, ultrastructure, replication; The virus cryptogram; Transmission of Plant Viruses.</p> <p>3. Plant Bacterial Interactions and Mycoplasma: Evolutionary aspects of plant microbe interaction; Species of bacteria associated with plants in health and disease; bacterial endophytes; phylloplane and rhizosphere microbiology; role of bacteria in biogeochemical cycling; Present picture of phylogeny and systematics of bacteria; techniques used to study plant-microbe interactions; Agriculturally beneficial bacteria; Economic importance in relation to biological N-fixation and production of antibiotics and enzymes, importance of Actinobacteria and actinorrhiza. Present knowledge of biology and role of Mycoplasma and L-forms.</p> <p>4. Mycological Dimensions of Plants: Plants and fungi interaction through the window of evolution; present knowledge of fungal biodiversity, phylogeny and classification; fungal plant ecology and fungal endophytes; general biology, forms, structure and functions of Fungi; physiological aspects and nutritional modes of fungi; fungal genetics at classical and molecular level; the fungal holomorph; asexual and sexual reproduction; Structural, functional and ecological specialization of fungal mycelia and spores; Modern fungal systematics, Morphology and molecular-based taxonomy; fungi in tropical habitats in relation to the plants.</p> <p>5. Study of different groups of fungi with suitable native examples: Slime moulds, Chytridiomycota; Oomycota; Glomeromycota; Zygomycota; Ascomycota and Basidiomycota; Straminopile fungi.</p> <p>6. Economic and biotechnological dimension of fungi: Study of economic importance of fungi; Endo- and ecto-mycorrhizae; Orchid mycorrhizae; Edible and</p>	<p>1hour</p> <p>4 hours</p> <p>4 hours</p> <p>4 hours</p> <p>11 hours</p> <p>12 hours</p>
------------------------	---	---

	<p>poisonous mushrooms; Wood decay by fungi; Lichens; Yeasts; Fungal cultures; Fungal bioprospecting; Secondary metabolites; Industrial significance; Fungi in food processing, production of enzymes, alcohols, antibiotics; use of fungi for green chemistry and nanobiotechnological applications.</p> <p>7. Tropical Plant Pathology: Diseases of plants in the tropics and their systematic studies using modern techniques. A brief history of plant pathology in India. Symptomatology in fungal, bacterial, viral and mycoplasma diseases of plants; Obligate and facultative pathogens. Classification of plant diseases; methods in the study of plant diseases; Koch postulates; Principles of infection and spread of disease; Sources of inoculum; Physiology of host-pathogen interaction; Role of enzymes and toxins in pathogenesis; Molecular basis of plant diseases; Susceptibility and resistance; Epidemiology, disease cycle, disease forecasting; Control of crop diseases by cultural, physical, chemical and biological methods; Crop rotation; Plant quarantine; Resistant varieties; Algal diseases. Diseases of cereals, pulses, vegetables, oil-seed crops, fruit plants, and plantation crops; Viruses, mycoplasma, protozoan and nematode diseases; Etiology, epidemiology and management of major diseases of paddy (blast, brown leaf-spot, sheath blight, bacterial leaf blight and tungro Virus), jowar (smut by <i>Sphacelotheca sorghi</i> and <i>S. cruenta</i>), sugarcane (red rot, smut, grassy shoot disease), groundnut (tikka), cotton (wilt), coconut (leaf blight, wilt, yellowing), banana (leaf spot, bunchytop), mango (powdery mildew, sooty mould). Post-harvest and market pathology.</p>	
<u>Pedagogy:</u>	Lectures/ Tutorials/Assignments/Seminars/Moodle Based Work/Videos/Self-Study

<u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. Be able to identify microbial habitats and plant disease symptoms. 2. Be able to work in a field laboratory for mycological studies. 3. Gain better understanding of tropical microbial biodiversity and their ecological roles. 4. Have better prospects as plant pathologist in various farms. 	

Programme: M. Sc. (Botany)

Course Code: BOC-124

Title of the Course: Lab in Plant Microbiology and Pathology

Number of Credits: 1 (Total sessions 24 hours)

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Basic knowledge of microbial habitats in a tropical setup and general idea of diseases affecting crops.	
<u>Objective:</u>	To impart requisite field and lab skills in plant microbiology and pathology with emphasis on tropical strains and local needs in agriculture and economy dealing with economically important microbes.	
<u>Content:</u>	<ol style="list-style-type: none">1. Microbial ecology in relation to the plants-Introduction to field techniques to study plant-microbe interactions.2. Isolation and maintenance of pure cultures using common microbiological media.3. Phylloplane microflora- visualization and isolation.4. Rhizosphere microflora- visualization and isolation.5. Use of Microscopy in studying microbes in detail - preparation of unstained and stained specimens of eubacteria, actinobacteria.6. Preparation of unstained and stained specimens of yeasts, fungi.7. Examination of gram character of bacteria.8. Photomicrography and digital image analysis of representative pure cultures and interpretation of results.9. SEM study of plant viruses using electron dense stains.10. Studying Phylogeny of plant viruses using bioinformatics tools.11. Study of root nodulation, symbiosome, Nitrogen fixing <i>Rhizobium</i>, leghemoglobin and Quorum Sensing in bacterial population.12. Methods of isolation and culturing of fungi: colony characters; microscopic observations; morphology of hyphae and spores.13. Study of reproductive structures of different genera of fungi.14. Study of fungal physiology in pure colonies – characterization of fungal colonies.15. Microfluidics in mycology- fabrication and application of microfluidics devices to fungal cultures for realtime visualization of fungal metabolic activities.16. Introduction to mycological databases and mycosystematics on Internet.17. Introduction to Mycobioinformatics- tools and	Except 25-27 All 2 hour sessions

	<p>techniques (exercise to construct fungal phylogenetic tree to be given).</p> <p>18. Observation of different fungal substrates using sterile moist chamber incubation (<i>e.g.</i> herbivore dung; decomposing leaf-litter).</p> <p>19. Observations on ecological succession of fungi; Terrestrial, marine and freshwater fungi.</p> <p>20. Particle-plating technique for isolation of litter fungi.</p> <p>21. Technique for isolation of fungal endophytes.</p> <p>22. Isolation and serial dilution techniques (<i>e.g.</i> soil, dung and leaf litter).</p> <p>23. Collection of infected specimens in the field and observation of symptoms.</p> <p>24. Hand sections and tease mounts from infected plant specimens.</p> <p>25. Study of as many as possible viral, bacterial and fungal diseases of crop plants (cereal, vegetable, fruit, and plantations) from surrounding habitats in Goa.</p> <p>26. Submission of 10 dried herbarium specimens of infected plant materials [fungal (4) + bacterial (3) + viral (3)] collected from nearby habitats.</p> <p>27. A mini field project to study crop diseases from field and market specimens.</p>	
<u>Pedagogy:</u>	Field visits and lab exercises/sample collections/use of electronic, digital and visual keys, herbarium production/videos/moodle guided exercises/mini projects/demonstration.	
<u>References/Readings</u>	<ol style="list-style-type: none"> Sharma, P.D. (2004). The Fungi for University students. Rastogi Publications, Meerut. Srivastava, J.P. (1998). Introduction to Fungi. Programme: M. Sc. (Botany)

Course Code: BOC-125

Title of the Course: Systematics of Angiosperms.

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied Plant Taxonomy at undergraduate level. They should be good in basics of classification and nomenclature of angiosperms.	
<u>Objective:</u>	Taxonomy is fundamental to the rest of the studies in biology and at the same time it takes inputs from other branches. The ultimate aim of taxonomy is to understand the evolution at work. Angiosperms being the dominant as well as most evolved plant group, the sources of characters for taxonomy are also varied. It is also being practiced at various levels, from morphology to phylogenomics. This course aims to give comprehensive understanding in angiosperm taxonomy as well as its practice and applications.	
<u>Content:</u>	1. Plant taxonomy: Scope and importance; taxonomy as a synthetic discipline; principles and goals; applications - IUCN Red List, Conservation priorities.	4 Hours
	2. Floras, Revisions and Monographs: Floras, Revisions and Monographs as basis of taxonomy; components, design and methods of floristics and revisionary/ monographic studies; role of herbaria, botanic gardens and literature in taxonomic studies; important literature resources.	6 Hours
	3. Nomenclature: Purpose, Principles, and overall knowledge of International Code of Nomenclature for algae, fungi, and plants (ICN) and Articles pertaining to typification, publication, priority, author citation and their application.	7 Hours
	4. Cladistics: Introduction – advantages and problems; classical taxonomy as base for molecular systematics; systematics and phylogenetics classifications – use and utility. The choice of molecules in systematics – Nucleic acids, proteins and amino	9 Hours

	<p>acids. Molecular evolution – neutral theory, molecular clock. Cladistics (Phylogeny) – concepts, parsimony, cladograms and trees; characters: apomorphic and plesiomorphic characters, homologous vs analogous; character states, binary and multistate characters, characters transformations; morphometric vs molecular characters. Trees - monophyly, polyphyly and paraphyly; rooted and unrooted. Sequences – finding homologous sequences and alignment; local vs global alignment; pairwise and multiple sequence alignment. Tree construction – algorithmic (UPGMA and Neighbour Joining) and tree-searching (Parsimony, Maximum Likelihood and Bayesian). Phylogenomics as the modern trend in plant taxonomy.</p> <p>5. Phylogeny and Classification of Angiosperms: Fossil angiosperms and their ecology. APG IV system of classification of angiosperms; characteristics and phylogeny of clades: Orders – Amborellales, Nymphaeales, Austrobaileyales, Chloranthales; Clades (Magnoliids), (Monocots (Commelinids)), Order Ceratophyllales, (eudicots ((superrosids (Rosids (malvids, fabids))) (Superasterids (asterids (campanulids, lamids)))))).</p>	10 Hours
Pedagogy:	Lectures/ Tutorials/Assignments/Self-Study

<u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. Able to relate plant taxonomy to various other branches including conservation. 2. Should be in a position to understand and use Floras, Revisions and Monographs. 3. Should be able to apply nomenclatural rules. 4. Able to understand and interpret the phylogenetic trees. 5. Know the latest phylogenetic classification of angiosperms, relationships among major clades and their evolution. 	

Programme: M. Sc. (Botany)

Course Code: BOC-126

Title of the Course: Lab in Systematics of Angiosperms

Number of Credits: 1

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied or have the practical knowledge of Plant morphological terms.	
<u>Objective:</u>	To learn plant taxonomy through dissection of flowers, use of Floras and field study and develop skills to handle plant identification and floristic work independently and at the same time able to handle molecular data for interpreting phylogeny.	
<u>Content:</u>	<ol style="list-style-type: none"> 1. Writing of technical descriptions. 2. Construction of keys. 3. Identification of local species using Floras, keys and campus field trips. 4. Identification of 25 families using diagnostic characters; diagnostic characters to be illustrated. 5. Construction of phylogenetic tree based on gene sequences available at NCBI database (each student may be given different gene sequences/taxa). 	2 hours 2 hours 4 hours 12 hours 4 hours
<u>Pedagogy:</u>	Through actual dissection of floral parts/ Field trip /Practice	

<u>References/Readings</u>	<ol style="list-style-type: none"> 1) Barry G. Hall. 2007. Phylogenetic Trees Made Easy: A How-To Manual, Third Edition. <u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. Able to write technical description of plants and construct and use keys for identification. 2. Able to identify common plant families based on the morphological features. 3. Able to recognise common plants. 4. Able to construct phylogenetic tree based on molecular sequences. 	

Programme: M. Sc. (Botany)

Course Code: BOC-221

Title of the Course: Internal Morphology and Developmental Biology of Angiosperms.

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of anatomy and developmental biology of higher plants.	
<u>Objective:</u>	The paper provides deeper understanding of various anatomical structures and their functions, several embryological processes including pollen pistil interaction, applied aspects of embryology, various palynological methods to understand pollen biology and pollen biotechnology of flowering plants.	
<u>Content:</u>	<u>Internal Morphology</u> 1. Meristems: Shoot and root apical and intercalary meristems; their ultra-structure and histochemistry;	3 hours

	cytological and molecular analysis of the shoot apical meristem; autonomy of the meristem and vascular tissue differentiation in the shoot apex.	
	2. Vascular cambium vs cork cambium, factors controlling their activity; lenticels; abscission; wound healing.	2 hours
	3. Ontogeny, phylogeny, evolution, ultra-structure and function of primary and secondary xylem; wood anatomy; bio-deterioration of wood and its prevention.	3 hours
	4. Ontogeny, phylogeny, evolution, ultra-structure and function of primary and secondary phloem.	2 hours
	5. Structural variability in leaves including leaf structures of C₃ and C₄ sub-types, CAM plants; leaf histogenesis; leaf meristems; evolution of leaf forms, heteroblasty. Origin, development and ultra-structure of trichomes and stomata.	3 hours
	6. Nodal anatomy: Nodal types, phylogenetic and evolutionary considerations.	1 hour
	9. Anatomy of monocotyledonous and dicotyledonous seeds and fruits - their ontogeny structure and functions.	2 hours
	<u>Embryology</u>	2 hours
	1. Microsporogenesis and formation of the male gametophyte: Anther differentiation, pollen development and maturation, gene expression during pollen development, male sterility and pollen abortion, male gametogenesis.	2 hours
	2. Megasporogenesis and formation of embryo sac: Ovule differentiation and development, megasporogenesis, organization of embryo sac, types of embryo sac, gene function during megagametogenesis.	3 hours
	3. Pollen pistil interaction and fertilization: Pollen-stigma interaction and pollen tube guidance, pollen recognition by stigma, self-incompatibility, structural, biochemical and molecular aspects of gametophytic and sporophytic self incompatibility. Double fertilization, <i>in vitro</i> fertilization.	3 hours
	4. Endosperm and embryogenesis: Endosperm, embryo, nutrition and growth of embryo. Gene action during embryogenesis, storage compounds in endosperm and embryo, storage protein gene expression in transgenic systems; apomixis and polyembryony; applied aspects of embryology.	3 hours
	<u>Palynology</u>	
	1. Pollen Biology: Pollen morphological characters, Pollen wall features, pollen development and evolution of pollen types, palynology and taxonomy.	2 hours
		2 hours

	<p>2. Aeropalynology: Methods of aerospora survey and analysis; pollen allergy and pollen calendars.</p> <p>3. Mellittopalynology: Honey bee and pollen loads; role of apiaries in crop production.</p> <p>4. Palaeopalynology: Study of fossil pollens and spores and their significance in paleobotany and coal and oil explorations.</p> <p>5. Pollen biotechnology for crop production and improvement.</p>	<p>2 hours</p> <p>1 hour</p>
<u>Pedagogy:</u>	Lectures/ Tutorials/Assignments/Seminars/Self-Study	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. Shivanna, K. R. and Rangaswamy N. S.1992. Pollen Biology - A Laboratory Manual, Narosa Publishing House, New Delhi. 2. Batygina T. <u>Learning Outcomes</u>	1. Being able to apply the knowledge of anatomy, structure and functions to all flowering plants.	

	2. Being able to apply the embryological techniques and methods to various plant species and situations. 3. Being able to apply the knowledge of pollen biology and methods and techniques to various plant species. 4. Environmental biomonitoring of pollen allergens.	
--	--	--

Programme: M.Sc. Botany

Course Code: BOC-225

Title of the Course: Plant Physiology

No. of Credits: 3

Effective from AY: 2020-21

Prerequisite for course	Knowledge of the subject at UG level.	
Objective	This course teaches processes of plant water relationship, mineral nutrition and assimilation (nitrogen, sulphur and other inorganic nutrients), photosynthesis with emphasis on mechanism of abiotic stresses at physiological and molecular level with reference to crop productivity. The Course also teaches Plant growth and development due to light and phytohormones with emphasizes on cellular and molecular mechanism of signal transduction and physiological response.	
Content	The physico-chemical organisation of the plant cell and cell organelles; structure and composition of plasma membrane fluid mosaic lipo-protein model, membrane, Water relation of plants, unique physico chemical properties of water; bulk movement of water and substances across the membrane, aquaporins, stomatal regulation of transpiration, anti transpirants.	4hours
	Inorganic nutrition, macro and micro nutrients, deficiency symptoms, hydroponic studies; mineral absorption and translocation and assimilation; Nernst equation and Donnan's equilibrium.	2 hours
	Nitrogen metabolism: Nitrogen nutrition, organic nitrogen, nitrogen fixation in legumes, nitrate and ammonia assimilation: Sulfur metabolism and amino acid synthesis. Inter relationship between photosynthesis, respiration and nitrogen metabolism.	3 hours
	Photosynthesis: Importance of photosynthesis, Photosynthesis and environment. Light reaction: Radiant energy, photosynthetic apparatus, pigments and their biosynthesis; light harvesting complex; characteristics of two photosystems, photosynthetic electron transport, water oxidation and its molecular mechanism, photophosphorylation, pseudocyclic electron transport (Mehler reaction).	5 hours

	Dark reaction: Carbon dioxide fixation in C3, C4 and CAM plants regulation of PCR cycle; photorespiration and its regulation, environmental factors affecting photosynthesis.	3 hours
	Respiration: Aerobic and anaerobic respiration; cyanide independent respiration; cytochrome system; carbohydrate and lipid metabolism; high energy compounds and factors affecting respiration. ROS generation, effect and metabolism	6 hours
	Enzymes: Structure and classification; mechanism of action; Michaelis-Menten equation; Lineweaver-Burk plot; enzyme regulation; allosteric enzymes, isozymes, co-enzymes and vitamins.	2 hours
	Growth and development: Phytochromes and light control, regulatory mechanism; role of phytochrome in phototropism; physiology of flowering and fruiting.	2 hours
	Phytohormones: Auxin; cytokinin; Gibberellins; ethylene; ABA. polyamines; brassinosteroids, jasmonate, their synthesis, distribution; and physiological effects. Molecular mechanism of action.	5 hours
	Stress Physiology: Abiotic stresses (drought, salt and metal), morphological and cellular adaptation; molecular mechanism of stress tolerance and protection.	4 hours
	Seed dormancy and germination, senescence, circadian rhythms in plants (exogenous factors and molecular mechanism).	
Pedagogy	Lecture through PPT/E-learning/Assignments/Seminars/LSM Moodle

Learning outcome	Students will be able to demonstrate a depth of knowledge of physiological processes together with a better understanding of interaction and regulation of growth, metabolism and development and influence of environment on plant and further will be able to communicate scientific ideas in both written and oral forms to diverse audiences.

Programme: M.Sc. Botany

Course Code: BOC-226

Title of the Course: Lab in Plant Physiology

No. of Credits:1

Effective from AY: 2020-21

Prerequisite for course	Knowledge of the subject at UG level to be able to prepare various types of solutions, set pH, and handle basic laboratory tools and techniques. Preferably taken paper BOO 121 and 122	
Objective	This course is designed primarily to relate the learning of concepts in classroom to demonstrate experimental foundation of underline concepts/principles mainly on aspects of biological molecules, photosynthesis, respiration, transport, growth, growth substances and the stress physiological aspects of crop yield.	
Content	1. Verification of law of diffusion and osmosis	2hours
	2. Determination of water potential and osmotic potential	2 hours

	and RWC in plant tissue.	
	3. Analysis of plant tissue for: Water, organic and inorganic content; Determination of a few macronutrients by Flame photometer, and micronutrient by AAS.	4 hours
	4. Quantitative estimation of protein.	2 hours
	5. Determination of ascorbic acid content of tissue.	2 hours
	6. Separation of protein by PAGE.	2 hours
	7. Pigments extraction, separation, identification and quantification.	2 hours
	8. Photo-oxidation of plant pigments.	2 hours
	9. Determination of oxidative damage in tissue using TBARS method	2 hours
	10. Enzyme activity with respect to temperature or pH or substrate concentration.	4hours
	11. Isolation of intact organelles: chloroplasts and mitochondria.	2 hours
	12. Assay of photosynthetic electron transport activity from isolated chloroplast using oxygraph.	2 hours
	13. Assay of respiratory electron transport activity from isolated mitochondria using oxygraph.	2 hours
	14. Non-invasive measurements of photosynthesis (chlorophyll fluorometer).	2 hours
	15. Assay of nitrate/nitrite reductase activity in leaves/algae.	2 hours
	16. Estimation of Proline under stress and normal conditions.	2 hours
Pedogogy	Wet laboratory exercises	
Reading/reference	1. D.T. Plummer , An introduction to practical Biochemistry. Tata McGraw Hill publishing company Limited. New Delhi. 2. J.B. Harborne , Phytochemical Methods. Chapman and Hall. London.	
Learning outcome	The understanding of the rationale behind the practical procedures and ability to interpret the observations will enhance the student's ability to modify/design their own procedures if necessary as they advance to higher levels. They will develop ability to apply the knowledge of plants symptoms/observation to their underline physiological causes.	

Programme: M. Sc. (Botany)

Course Code: BOC-321

Title of the Course: Plant Molecular Biology

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of biochemistry and molecular biology.	
<u>Objective:</u>	The paper deals with various molecular biological processes of DNA replication, transcription and translation. Molecular biology of recombination, synthesis and processing of various RNA molecules are discussed. Further the paper provides deeper understanding of regulation of gene expression in various organisms.	
<u>Content:</u>	1. Introduction to Molecular Genetics and Genomics: History of DNA molecule & discoveries till date. Physical nature of DNA: DNA is the genetic material, Chemical nature of DNA: Structure of nucleotides, Bonding, double helix and other helices. Factors affecting DNA structure. Organization of DNA. How Genes function at Molecular level - Replication, Transcription & Translation.	5 hours
	2. Molecular Biology of DNA Replication: Enzymes involved in replication, DNA replication is semi-conservative, Meselson-Stahl expt., Multiple Origins & bi-directional DNA replication in Eukaryotes, Replication of Virus & Theta replication of Circular DNA molecules, Rolling Circle replication, Plasmid DNA using a Rolling Circle, Unwinding, Stabilization & Stress relief, initiation by a Primosome complex, Chain elongation & Proofreading, discontinuous replication of the lagging strand, Terminator sequencing of DNA.	6 hours
	3. Molecular Biology of Recombination: Molecular mechanisms of Recombination, Gene conversion, Mismatch repair, the Holliday model of recombination, Single strand break & repair model.	3 hours
	4. Transcription: Enzymes in transcription; Basic features of transcription, Initiation elongation and termination, promoters and enhancers; prokaryotic and eukaryotic transcription.	5 hours
	5. Regulation of Gene Expression: Regulation of gene expression in prokaryotes and Eukaryotes. Transcriptional Control I, expression of lac operon, Transcriptional Control II, Attenuation, Antitermination, Methylation, Yeast GAL regulatory pathway, alteration of gene expression by DNA sequence rearrangements in	6 hours

	<p><i>Salmonella</i> and <i>Trypanosoma</i>.</p> <p>6. RNA Molecules and RNA Processing: Gene structure, Structure & Processing of messenger RNA, transfer RNA, ribosomal RNA, small interfering RNAs & micro RNAs, regulation through RNA processing & decay, alternative splicing, mRNA stability, co-suppression through RNA turnover, RNA interference (RNAi).</p> <p>7. The Genetic Code and Translation: Molecular relation between Genotype & Phenotype, The Genetic Code, Factors involved in initiation, elongations and termination of translation, Post translational processing and modification, Transport of protein across the membrane.</p>	<p>5 hours</p> <p>6 hours</p>
Pedagogy:	Lectures/ Tutorials/Assignments/Seminars/Self-Study

Programme: M.Sc. Botany

Course Code: BOC-323

Title of the Course: Plant Genetic Engineering

No. of Credits: Three (3)

Effective from AY: 2020-21

Prerequisite for course	Knowledge of the subject at UG level.	
Objective	This course is designed to understand basic principles, tools, techniques and recent advances in plant genetic engineering. Students will be exposed to restriction enzymes, vectors (plasmids, phasmids, <i>etc</i>), joining and construction of genome and cDNA library and its screening for desired gene, transformation, etc. Student will also be exposed to site directed mutation techniques and other modern techniques such as sequencing, PCR, RT-PCR, RNAi <i>etc.</i> to study gene amplification and their expression. This paper also discusses other application of genetic engineering such as genetic marking and Molecular taxonomy.	
Content	Introductory lecture on application of genetic engineering in the field of Plant science with regard to Agriculture, environment and medical field and study of plant taxonomy.	2hours
	Restriction and modification of DNA: Basic principle of genetic engineering; restriction enzyme, cutting and joining the DNA; Vectors: plasmids, fine structure of vector gene desirability traits; construction of plasmid, purification of plasmids, various types of plasmids, Bacteriophage and cosmid, single and double standard vectors and their growth cycle and regulation; various cloning strategies, Genome library and cDNA library, selection strategies for desired transformants, Genetic system provided by <i>E. Coli</i> and its host.	8 hours
	Agrobacterium-mediated gene transfer: Biology and molecular basis of Agrobacterium mediated plant transformation and its application. Other direct gene transfer methods. Conventional Plant Breeding vs Genetic Engineering.	4 hours
	Site directed mutagenesis: DNA sequencing, various strategies for carrying out site directed mutagenesis.	3 hours
	Structure, function and regulation of genome: General organization and replication, transcription and translation of , mitochondrial and	6 hours

	chloroplast genome; Genetic interactions in nucleus, chloroplast and mitochondria (retrograde signaling/plastid factors); Genetic codes in organelles;	
	Gene silencing, editing, sequencing, amplification expression in plants: Post transcriptional and transcriptional gene silencing (RNAi, Antisense), Gene editing and its application (CRISPER-CAS9), mutants of gene silencing, RNA virus in plants, virus induced gene silencing, Dideoxy and other methods of sequencing, PCR, RT-PCR and microarrays.	6 hours
	Application of plant genetic engineering: Genetic engineering of plants for various desired characters (herbicide resistance, insect resistance, virus and abiotic stress resistance; to improvement of crop yield and quality; rice genome project, other sequenced genomes, (With relation to matter discussed above)	5 hours
	Genetic Engineering and public Concerns: Ethical & Environmental concerns on Genetic Engineering of plants. Genetically Engineered Foods, Safety of Genetically Engineered Foods, Labeling, Future Foods and Regulatory Challenges, 'Pharm' Factories of the Future. Field testing of transgenic plants; Bio-safety issues in Indian context; Indian rules, regulation and procedures for handling transgenic plants.	2 hours
Pedagogy	Lectures/E-learning/Assignments/Seminar/Moodle/Group discussion	
Reading/ reference	<ol style="list-style-type: none"> 1. David Freifelder. 1987. Molecular Biology. Second Edition. Narosa Publishing House, New Delhi. 2. R. W. Old and S. B. Primerose. Principles of Gene Manipulation. An Introduction to Genetic Engineering. 3. Benjamin Lewin. 1999. GENES VII. Oxford University Press. 4. O'Brien, L. and R. J. Henry. Books referred for BOC-321 Plant Molecular Biology should also be read. 	
Learning outcome	After completing this course student should be able to understand basic principles of plant genetic engineering in order to develop and validate transgenic plants.	

Programme: M. Sc. (Botany)

Course Code: BOC-324

Title of the Course: Lab in Plant Molecular Biology and Genetic Engineering

Number of Credits: 2 (48 hours)

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of biochemistry, molecular biology and instrumental techniques at UG level.	
<u>Objective:</u>	To learn and understand various methods, techniques and hands on experiments with techniques concerning study of plant molecular biology and genetic engineering. This course is designed to introduce students to both the principles and the applications of molecular recombinant DNA technology to plants and microbial organisms. It describes the use of genetically engineered products to solve agriculture and environmental problems for human welfare.	
<u>Content:</u>	1. Preparation of media and other requirements, sterilized glassware etc.	2 hours
	2. Isolation and purification of genomic DNA from plant materials.	2 hours
	3. Isolation and purification of RNA from plants.	2 hours
	4. Culture of plasmid and maintenance of culture.	2 hours
	5. Isolation of plasmid DNA.	2 hours
	6. Quantitative estimation of genomic DNA and RNA using spectrophotometer.	2 hours
	7. Agarose gel electrophoresis of genomic DNA and RNA and detection using gel documentation system.	2 hours
	8. Digestions of DNA by restriction enzymes and size fractionation of fragments.	2 hours
	9. Ligation of digested fragments.	2 hours
	10. Primer designing.	2 hours
	11. cDNA formation using reverse transcriptase.	4 hours
	12. RT-PCR quantitation of selected gene(s) using SYBRG.	4 hours
	13. Use of software for quantitation of gene and compare the expression level.	2 hours
	14. Southern Blotting/Northern Blotting/Western Blotting (any one)	2 hours
	15. Creating a transformant using commercial construct.	4 hours
	16. 16 or 18s rRNA analysis.	4 hours
	17. Leaf disc transformation using Agrobacterium, establishment of transgenic plants and GUS staining of GFP viewing.	4 hours
	18. Amplification of genomic DNA using ISSR/ RAPD	4 hours

	random primers in PCR and agarose gel electrophoresis and detect the banding patterns under gel documentation system and analysis of bands to understand genetic variation in plants.	
	Any 15 experiments will be conducted depending on availability of material/equipments etc.	
<u>Pedagogy:</u>	Hands on practicals.	
<u>References/Readings:</u>	<ol style="list-style-type: none"> 1. Burton E. Tropp. 2012. Molecular Biology. Fourth Edition. Jones and Bartlett India Pvt. Ltd, New Delhi. 2. David Freifelder. 1990. Programme: M. Sc. (Botany)

Course Code: BOC - 421

Title of the Course: Cytogenetics and Plant Breeding.

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of Genetics and Plant Breeding.	
<u>Objective:</u>	The paper provides the students with detailed concepts of cytogenetic and Plant breeding.	
<u>Content:</u>	<p>1. Cell division and Cell cycle: In prokaryotes and Eukaryotes; Eukaryotic chromosome replication; Regulation of Mitotic Phase (M Phase); Mitosis and Meiosis, their significance; Bacterial and Viral genomes.</p> <p>2. Morphology of eukaryotic chromosomes: Chromosome number, size and general morphology; Karyotype; Chromosomes banding patterns; Specialized chromosomes; B chromosomes; Chromosome movement; Prokaryotic nucleoids; Fluorochromes.</p> <p>3. Molecular organization of Eukaryotic chromosomes: Chemical composition, chromosome structure; Organization of chromatin fibres; Molecular structure of Centromere and telomere.</p> <p>4. Organellar chromosomes: Basis of extra nuclear inheritance; Plastid inheritance, Mitochondrial inheritance; Organellar DNA – Chloroplast DNA (cpDNA), Mitochondrial DNA (mtDNA), Replication of cpDNA and mtDNA.</p> <p>5. Plasmids, IS elements, transposons and Retroelements: Plasmids, Insertion sequence or IS elements; Transposons and controlling elements (in prokaryotes and Eukaryotes - copia, FB, P and I in Drosophila; Ty in yeast; AC-DC and Spm in corn; Retroelement (viral and non viral); Mechanism of</p>	<p>5 hours</p> <p>4 hours</p> <p>3 hours</p> <p>3 hours</p> <p>3 hours</p> <p>3 hours</p>

	transposition, uses of transposons.	
	6. Molecular mechanisms to mutation and DNA repair: Types of mutations; Molecular basis of mutations; mutagens, mechanism of DNA repair.	4 hours
	7. Introduction to Plant Breeding: Objectives and achievements; Pattern of evolution in crop plants; Plant introduction - Purpose of plant introduction; some important achievements of plant introduction; Domestication and acclimatization.	5 hours
	8. Heterosis and inbreeding depression: Inbreeding depression; Effects of inbreeding; Degrees of inbreeding depression; Homozygous and Heterozygous balance; Heterosis in cross and self-pollinated plants; Genetic basis of heterosis and inbreeding depression; Dominance hypothesis; Over-dominance hypothesis; Physiological basis of heterosis; Commercial applications.	3 hours
	9. Distance hybridization and <i>in-vitro</i> techniques in plant breeding: Distant hybrids and barriers in the production of distant hybrids, Application in crop improvement; embryo, Meristem, anther and pollen culture, achievements.	3 hours
	10. Genetics and crossing techniques of economically important crop plants: Wheat, Rice, Maize and Cotton.	
Pedagogy:	Lectures/Assignments/Tutorials/Self study.

<u>Learning Outcomes</u>	Upon completion of this course, the students will be able to take up job assignments in agri-based industries or work as research assistants on research projects.	

Programme: M.Sc. Botany

Course Code: BOO-121

Title of the Course: Techniques and instrumentation in Botany.

No. of Credits: 3

Effective from AY: 2020-21

Prerequisite for course	Knowledge of chemistry, biochemistry, instrumental techniques at UG level	
Objective	This paper teaches basic of various types of techniques and instrumentation such as spectrophotometry, chromatography, electrophoresis, scintillation and current molecular techniques to carry out routine and advance research in Botany/Life Science. The emphasis is on principle of the technique, instrumentation design, methodology of sample preparation and handling of equipment and application of the technique in the field of Botany.	
Content:	Laboratory practices and safety in laboratory: General safety measure, Chemical hazards, Physical hazards, Biological hazards, spillage and waste disposal, disposal of radioactive waste, first aid, MSDS.	2 hours
	pH and buffer solutions: SI units; Molarity and moles; Acids and base; Hydrogen ion concentration and pH, Dissociation of acids and bases; Buffer solutions.	3 hours
	Centrifugation Techniques: Basic principles of sedimentation; RCF and g forces, Density gradient centrifugation; design and care of rotors, safety aspects in the use of centrifuges.	2 hours
	Spectroscopic Techniques: General principles; Radiation energy and atomic structure; Basic law of light absorption; Types of spectra and their biological usefulness. Principle, application and instrumentation of UV-VIS spectrophotometry; IR (infrared) spectrophotometry; Spectrofluorometry, Atomic/flame spectrophotometry; Mass spectrometry.	9 hours
	Chromatography Techniques: General Principles and techniques and application and material of column chromatography for Adsorption, partition, molecular sieving, ion exchange and affinity chromatography. Factors influencing the resolution. Column development- isocratic, gradient solvent and thermal development. Chromatogram reading and qualitative and quantitative determination of peaks in a chromatogram	8 hours
	Electrophoresis Techniques: General principles, application of Isoelectric focusing, SDS-PAGE (sodium dodecyl sulphate), 2D electrophoresis, Blotting techniques; Detection, recovery and estimation.	6 hours
	Radiobiology: The nature of radioactivity; Atomic structure, stability and radiation; Isotopes; Types of radioactive decay; Detection and measurement of radioactivity; Applications of radioisotopes in biological sciences; Safety aspects of use of	2 hours

	radioisotopes.	
	Molecular techniques: Protein Crystallography, Microarray analysis, yeast hybrid assay, Immunoprecipitation assay, EMSA, DNase footprinting, Surface Plasmon resonance, Proximity labeling.	6 hours
Pedagogy	Lecture through PPT/E-learning/Assignments/Seminars/LSMMoodle

Molecular Biomethods Handbook, Hertfordshire, UK.</p>	
Learning Outcome:	After completion of the paper, students should be able to independently work on various instruments and understand their principle. Also students should be able to prepare various types of solutions and calculate mole fraction, molality, molarity, <i>etc.</i>	

Programme: M.Sc. Botany

Course Code: BOO-122

Title of the Course: Lab in Techniques and Instrumentation in Botany

No. of Credits: 1

Effective from AY: 2020-21

Prerequisite for course	Knowledge of chemistry, biochemistry, instrumental techniques at UG level	
Objective	Understanding of basic principles and phenomena in the area of techniques and instrumentation required for biological studies. The course will provide opportunity to learn theoretical and practical preparation and enabling students to operate and maintain instrumentation, develop methods and carry out given scientific protocol and develop ability in students to scientific and analytical reasoning.	
Content	1. Preparation of molar and other solution and setting of pH.	2 hours
	2. Absorption spectra of various compounds to understand λ max, substance absorption.	2 hours
	3. Verification of Beer's law.	2 hours
	4. pKa value of a buffer/ amino acids using pH meter.	2 hours
	5. IEF* (learning of gel formation and role of various components.)	2 hours
	6. SDS-PAGE of membrane proteins (learning of gel formation, etc.).	2 hours
	7. Analysis of gel.	2 hours

	8. Blotting.	4 hours
	9. Separation of organelles based on density gradient centrifugation (Using percoll or sugar gradient).	2 hours
	10. TLC for separating and identifying biomolecules.	2 hours
	11. GC*	2 hours
	12. Fluorescence spectrophotometry.	2 hours
	13. HPLC*.	2 hours
	14. Flame photometry.	2 hours
	15. Atomic absorption spectrophotometry*.	2 hours
	16. Scintillation counter*.	2 hours
	17. Centrifuges and rotor heads	2 hours
	*Demonstration only

Learning Outcome:	This Course will impart skill to students to be able to work in R & D and quality control laboratories in government and private organizations. Students should also be able to use modern instrumentation and classical techniques.	

Effective from AY: 2020-21

<u>Prerequisite for the Course:</u>	Knowledge of computers, Internet, Modern biology and biochemistry.	
<u>Objective:</u>	Course has focus on rapidly advancing fields of basics of bioinformatics (stress on genomics and proteomics), incorporating many hands on practice lessons with a wide range of public domain software tools, demos and mini projects assisting the students to pick up the minimum required skill sets demanded by bioknowledge based industries	
<u>Content:</u>	<p>1. Introduction to Bioinformatics: Nature of biological data, Overview of available Bioinformatics resources on the web, NCBI/EBI/EXPASY; Biological Databases: Nucleic acid sequence databases, GenBank/EMBL/DDBJ Protein sequence databases, PDB, SwissProt, UniProtKB, Genome databases-OMIM, structural databases, NDB, CCSD, driven databases Prosite, BLOCKS, Pfam/Prodom, Database search engines, Entrez, SRS.</p> <p>2. Overview/concepts in sequence analysis: Pairwise sequence alignment algorithms, Scoring matrices for Nucleic acids and proteins, Database Similarity Searches – BLAST, FASTA Multiple sequence alignment, PRAS, CLUSTALW.</p> <p>3. Structural biology and molecular modeling: Proteins - Primary, Secondary, Supersecondary, Tertiary and Quaternary structure, Nucleic acid - DNA and RNA, Carbohydrates, 3D Viral structures, Methods to study 3D structure, Analysis of 3D structures. Principles of protein folding and methods to study protein folding. Macromolecular interactions, Protein-Protein, Protein-Nucleic acids, Protein-carbohydrates. Introduction to Molecular modelling methods.</p> <p>4. Phylogenetic analysis: Alignment, tree building and tree evaluation, Comparison and application of Unweighted Pair Group Method with Arithmetic Mean (UPGMA), Neighbour Joining (NJ), Maximum Parsimony (MP), Maximum Likelihood (ML) methods, Bootstrapping, Jackknife; Software for Phylogenetic analysis. DNA barcoding: Methods tools and databases for barcoding across all species, Applications and limitations of barcoding, Consortium for</p>	<p>4 h</p> <p>3h</p> <p>4h</p> <p>4h</p>

	<p>Barcode of Life (CBOL) recommendations, Barcode of Life Database (BOLD).</p> <p>5. Analysis of DNA and Protein Microarrays: Designing of oligo probes; Image processing and normalization; Microarray data variability (measurement and quantification); Analysis of differentially expressed genes; Experimental designs.</p> <p>6. Application in drug design: Chemical databases like NCI/PUBCHEM; Fundamentals of Receptor-ligand interactions; Structure-based drug design: Identification and Analysis of Binding sites and virtual screening; Ligand based drug design: Structure Activity Relationship – QSARs & Pharmacophore; in silico predictions of drug activity and ADMET.</p>	<p>4h</p> <p>5h</p>
<u>Learning Outcomes:</u>	<p>Student will be able to:</p> <ol style="list-style-type: none"> 1) Develop an understanding of basic theory of computational tools. 2) Gain working knowledge of these computational tools and methods. 3) Appreciate their relevance for investigating specific contemporary biological questions.

--	---	--

Programme: M.Sc. (Botany)
Course code: BOO-124
Title of the Course: Lab in Bioinformatics
Number of Credits: 1
Effective from AY: 2020-21

<u>Prerequisite for the Course:</u>	Basic knowledge of biochemistry and molecular biology, computers and Internet, biodiversity and genomics.	
<u>Objective:</u>	Provide students with practical experience of use of common computational tools and databases which facilitate investigation of molecular biology and evolution-related concepts. To train the students in modern areas of biological analysis.	
<u>Content:</u>	<ol style="list-style-type: none"> 1. Exploring NCBI database, PUBMED and GenBank databases, EBI server and searching the EMBL Nucleotide database, Entrez, SWISSPROT & UniProtKB 2. Use of scoring matrices, Pair-wise local alignments of protein and DNA sequences using Smith-Waterman algorithm and interpretation of results. 3. Homology searches using different versions of BLAST and FASTA and interpretation of the results to derive the biologically significant relationships of the query sequences (proteins/DNA) with the database sequences. 4. Multiple sequence alignments of sets of sequences using web based and stand-alone version of CLUSTAL. Interpretation of results to identify conserved and variable regions and correlate them with physico-chemical and structural properties. 5. Search and retrieval: genomic and OMIM data at NCBI server, Interpreting DNA and Protein microarray data. 6. Use of gene prediction methods (GRAIL/Genscan/Glimmer), various primer designing and restriction site prediction tools. 7. Use of different protein structure prediction databases (PDB, SCOP, CATH). 8. Exploring and using the derived databases: PROSITE, PRINTS, BLOCKS, Pfam and Prodom for pattern searching, domain searches, etc.) 9. Construction and study of protein structures using RASMOL/Deepview/PyMol. Homology modelling of proteins. Use of tools for mutation and analysis of protein structures. 10. Phylogenetic analysis of protein and nucleotide sequences, tree building, databases for barcoding. 	<p>2h</p> <p>1 h</p> <p>1h</p> <p>1h</p> <p>1h</p> <p>1h</p> <p>1h</p> <p>1h</p> <p>2h</p>

<u>Learning Outcomes:</u>	<p>Student will be able to:</p> <ol style="list-style-type: none"> 1) Develop an understanding of basic theory of computational tools. 2) Gain working knowledge of these computational tools and methods. 3) Appreciate their relevance for investigating specific contemporary biological questions. 	
<u>Pedagogy:</u>	Internet based tools, hands on and group exercises, mini projects, videos, moodle guided exercises, videos, expert lectures, industrial visits, seminars.	
<u>References/Readings:</u>	<ol style="list-style-type: none"> 1. Andrew Leach. 2001. Molecular Modeling: Principles and Applications, Prentice Hall. 2. Attwood, T. K. and Parry-Smith, D. J. 2001. Programme: M. Sc. (Botany)

Course Code: BOO-125

Title of the Course: Oenology (Wine Science and Technology)

Number of Credits: 1

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of fermented beverages and their cultural role.	
Objective:	strongly backed by local winemakers and industries and tourism department and appreciated by NAAC team in 2014 this short course covers the basics of wine and winemaking (enology) and the chemistry behind the process and all basic aspects of wine culture, history, anthropology, service, tasting and toasting wines and also delves on microvinification or small scale fruit wine production. A few demos would be given and a visit to	

	local wineries would be organized.	
Content:	1. Overview of Enology, contrast between ancient and modern methods of wine making. 2. Viticulture and Grape species. 3. Wine Types and Styles, Wine Regions and Terroir, the Indian wine scene. 4. Harvesting and processing of grapes and other fruits. 5. Sources of contamination in wine making, Sanitation and Sterilization. 6. Scales of winemaking, microvinification, Materials and supplies used in wine making. 7. Chemistry and cell biology of fermentations with yeast and bacteria. 8. Fermentation Processes, Post-Fermentation. 9. Wine Analysis, Chemical Components of Wine, Biochemical Reactions in Fermentation. 10. Wine Acids, Aroma compounds (Terpenes), Color and FlavorCompounds (phenolics, Tannins). 11. Sensory evaluation and Quality control in wine making. 12. Wine bottling, corking, packaging and marketing.	1hour 1hour 1hour 1hour 1hour 1hour 1hour 1hour 1hour 2hours demo
Pedagogy:	Lectures/ Tutorials/Assignments/Seminars/Videos/Expert Lectures/Industrial visits/Moodle based guidance/ Self-study

<u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. To be able to understand international trends in production and marketing of wines. 2. Ability to appreciate the role of wine in culture, religion, industry and economy. 3. Ability to work as an oenological consultant. 4. Better prospects in tourism industry serving wines. 	

Programme: M. Sc. (Botany)

Course Code: BOO-126

Title of the Course: Lab in Oenology (Wine Science and Technology)

Number of Credits: 1 (24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of botany, grapes, fruits, fermentation processes, microbiology, general interest in food and beverages sector. This course is not intended for those who see alcoholic beverages as taboo.	
Objective:	To impart training in benchtop production of fruit wines and in service, testing and appreciation of various wines and knowledge of global wine brands in order to make students employable as oenologists in hospitality or wine production sector	

Content:	1. Examination of different commercial strains of wine yeasts	2 hours
	2. Microscale production of grape wine	4 hours
	3. Monitoring of fermentation parameters of grape wine Use of refractometer and hydrometer	4 hours
	4. Benchtop production and monitoring of wines from fruit juices	10 hours
	5. Organosensory evaluation of grape and non grape fruit wines.	2 hours
	6. Report on wine brands and wine marketing. *For demos: visit to be organised to local wineries/fermentation units: Le Meredien Distillery & Winery, Vinicola, Margao; Cazcar, Nanoda and others wine tasting sessions.	2 hours
Pedagogy:	Lab Exercises, Demos, Field visits, Industrial visits, Expert Lectures, Videos.	
References/Readings	<ol style="list-style-type: none"> 1. Boulton, R. B., Singleton, V. L., Bisson, L. F. and Kunkee, R. E. 1996. Principles and Practices of Winemaking. Patrick Iland Wine Promotions, PO Box 131, Campbelltown, South Australia 5074. 	
Learning Outcomes	<ol style="list-style-type: none"> 1. Ability to understand global wine sector, wine market and wine brands. 2. Ability to define a terroir. 3. Ability to analyse global wine trade trends. 3. Ability to produce fruit wines on small scale. 4. Ability to do sensory evaluation of wines. 5. Ability to work as a trainee oenologist. 6. Ability to work as wine journalist or columnist. 7. Ability to join hospitality sector as an expert on elite brands of wines. 8. Better prospects to take advanced courses as vintners or sommeliers. 	

Programme: M. Sc. (Botany)

Course Code: BOO-127

Title of the Course: Mine Wasteland Management.

Number of Credits: 2

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of Environmental Biology and Ecology.	
<u>Objective:</u>	To impart training to students on various aspects of mine waste reclamation strategies.	
<u>Content:</u>	<p>1. Contaminated land: Sources of contamination, Open cast and underground mining; Production of wastes – reject dumps and tailings; Mineral resources - use (including economic impacts) and exploitation; beneficial uses of wastes; Environmental issues, Problems (man induced landslides, soil erosion, land degradation, pollution of water bodies and agricultural fields, air pollution and health risks); Flora of mine wastelands (natural and managed).</p> <p>2. Characteristics of wastes – Physical characteristics – texture, bulk density, specific gravity, porosity, air content, field capacity, wilting coefficient, water holding capacity, colour, pH, C:N ratio, compaction; Chemical characteristics.</p> <p>3. Remediation of contaminated lands – Physical, chemical and biological methods; soil washing, soil vapour extraction (SVE), soil flushing, excavation, isolation/encapsulation, thermal desorption, land farming, biopiles, bioslurry system, bioventing, stabilization, vitrification, phytoremediation. Mycorrhizoremediation.</p> <p>4. Phytoremediation strategies – Phytoextraction and phytomining, rhizofiltration, phytostabilization, phytovolatilization, phytodegradation, rhizodegradation, phytodesalination.</p> <p>5. Elemental accumulation in plants – heavy metals, heavy metal toxicity, accumulation of elements, phytosiderophores, heavy metal accumulation.</p> <p>6. Selection of Plant species: Factors affecting plant selection, plant species for reclamation, monocultures v/s polycultures; native v/s exotic plants; plant propagation.</p> <p>7. Conditioning of waste: organic material; Fly ash, zeolites, neutralizing materials; fertilizers; PSB's,</p>	<p>4 hours</p> <p>2 hours</p> <p>3 hours</p> <p>2 hours</p> <p>2 hours</p> <p>2 hours</p> <p>3 hours</p> <p>3 hours</p> <p>2 hours</p>

	rhizobia, PGPR, mycorrhizae, co-remediation. 8. Land use options: success of reclamation, prospective land use; frame work for land evaluation, land suitability classification; land quality and characteristics; land uses. 9. Biotechnological approaches to phytoremediation: genetic engineering in phytoremediation, tissue culture plants for phytoremediation. 10. Geotourism in mining sites.	1 hour
Pedagogy:	Lectures/Assignments.

B. B. Dhar 2000 Mining and environment. APH Publishers, Nanital.	
Learning Outcomes	Upon completion of this course, the students gain expertise in mine waste reclamation. This will enable them to take up consultancy studies.	

Programme: M. Sc. (Botany)

Course Code: BOO-128

Title of the Course: Seed Science and Technology.

Number of Credits: 2

Effective from AY: 2020-21

Prerequisites for the course:	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of seed biology.	
Objective:	To facilitate deeper understanding of various aspects of seed science and technology.	

<u>Content:</u>	1. Concept of seed technology; seed quality, definition, importance and goals of seed technology; types of seed programmes; Steps involved in development of a seed programme.	2 hours
	2. General Principals of seed production and Seed Processing: genetic and agronomic principles; Maintenance of nucleus seed; production of Breeder, Foundation and Certified seed; principles of seed processing; methods of seed drying.	3 hours
	3. Seed cleaning equipment and their functions: Functions of Scalper, Debearder, Scarifier, Huller, Seed Cleaner and Grader. Screen cleaners, specific gravity separator, indented cylinder, velvet-spiral-disc separators, colour sorter, delinting machines.	3 hours
	4. Seed treatment: Types of seed treatment, seed treating formulations and equipments, seed disinfestations, identification of treated seeds; packaging: principles, practices and materials; bagging and labeling.	4 hours
	5. Seed storage: Seed drying and storage; drying methods-importance and factors affecting it, changes during storage, concepts and significance of moisture equilibrium, methods of maintaining safe seed moisture content. Methods to minimize the loss of seed vigour and viability; factors influencing storage losses. Storage methods and godown sanitation. Storage structures. Storage problems of recalcitrant seeds and their conservation.	7 hours
	6. Seed germination methods; TTC test; Embryo excision method.	1 hours
	7. Seed Certification: Objectives of seed certification; legal status and phases of seed certification; formulation, revision and publication of seed certification standards.	1 hours
	8. Field Inspection: Method of inspection; Post harvest inspection; specifications for tags and labels.	2 hours
	9. Seed Legislation and Seed Law Enforcement: Seed Legislation in India; Regulatory Legislations; Seed Law Enforcement; Seed Control Order, 1983; The Plant Varieties Act.	
<u>Pedagogy:</u>	Lectures/Assignments.	

<u>References/Readings</u>	1. Agarwal R.L. 2007. Seed Technology. Oxford & IBH. 2. Agrawal P.K. and Dadlani M. 1992. Techniques in Seed Science and Technology. 2 nd Ed. South Asian Publications. 3. Agrawal P.K. 1993. Handbook of Seed Testing. Ministry of Agriculture, GOI, New Delhi. 4. Copland L.O. and McDonald M.B. 1996. Principles of Seed Science and Technology. Kluwer. 5. ISTA 2006. Seed Testing Manual. ISTA, Switzerland. 6. Martin C. and Barkley D. 1961. Seed Identification Manual. Oxford & IBH. 7. Tunwar N.S. and Singh S.V. 1988. Indian Minimum Seed Certification Standards. Central Seed Certification Board, Ministry of Agriculture, New Delhi.	
<u>Learning Outcomes</u>	Ability to work in seed banks and plant nurseries. Ability to educate farmers and seed producers. Ability to run seed distribution outlets. Ability to work as market watchdogs to detect spurious seeds. Ability to work as seed collectors.	

Programme: M. Sc. (Botany)

Course Code: BOO-129

Title of the Course: Lab in Seed Science and Technology.

Number of Credits: 1

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany. It is assumed that students have a basic knowledge of seed biology.	
<u>Objective:</u>	To facilitate deeper understanding of various aspects of seed science and technology.	
<u>Content:</u>	1. Identification of seeds of weeds and crops. 2. Physical purity analysis of samples of different crops. 3. Estimation of seed moisture content (oven method). 4. Seed dormancy breaking methods requirements for conducting germination test. 5. Seed germination testing in different agri-horticultural crops. 6. Viability testing by tetrazolium test in different crops. 7. Seed and seedling vigour tests. 8. Effect of drying temperature and duration on seed germination. 9. Testing coated/pelleted seeds. 10. Study of orthodox, intermediary and recalcitrant seeds.	2 hours 2 hours 2 hours 2 hours 4 hours 2 hours 2 hours 2 hours

	11. Global seed germplasm resources and their conservation.	2 hours 2 hours 2 hours
Pedagogy:	Practicals	
References/Readings	<p>8. Agarwal R.L. 2007. Seed Technology. Oxford & IBH.</p> <p>9. Agrawal P.K. and Dadlani M. 1992. Techniques in Seed Science and Technology. 2nd Ed. Learning Outcomes	<p>Ability to carry out seed germination tests.</p> <p>Ability to work in seed testing labs and commercial seed companies.</p>	

Programme: M. Sc. (Botany)

Course Code: BOO-221

Title of the Course: Plant-Animal Interactions

Number of Credits: 4

Effective from AY: 2020-21

Prerequisites for the course:	Should have basic degree in biology or a student of Masters Programme in any of the life science areas	
Objectives:	Plants and Animals form major groups of living organisms in the World. Myriads of interactions between them are the drivers of evolution. Compartmentalization of biological sciences into various disciplines, viz. Botany, Zoology, Microbiology etc., has taken away the opportunities of students to learn these interactions. This course bridges this gap and throws light on the application of this knowledge in the areas of biodiversity, conservation, pollination, crop productivity, biological control, bioprospecting, etc.	
Content:	1. Diversity and Plant-Animal interactions: Mutualism, Antagonism, Commensalism, Competition, Multi-trophic level	6 Hours

	<p>interactions; Species interactions and the evolution of biodiversity; Co-evolution and co-speciation of plants and animals; adaptive radiation; evolutionary history of interactions and evidences in the geological past.</p>	
	<p>2. Pollination Biology: Importance of cross pollination. Special differentiation associated with pollinator attraction – advertisement and reward (pollen, nectar, elaiophores, resin glands, osmophores, optical displays and visual clues). Floral adaptation to different pollinators; insect visitors (Hymenoptera, Diptera, Coleoptera, Lepidoptera, Thysanoptera), birds, bats, non-flying animals. Sapromyophily, brood-site pollination; fig-wasp interaction and pollination. Foraging theory, foraging strategies and time-niche strategies.</p>	8 Hours
	<p>3. Fruits, Seeds and Dispersal agents: Plant adaptations – Fruit chemistry (chemical compartmentalization – pulp and seed, nutritional aspect of pulp, palatability inhibitors and toxins). Seed coat, seed toxins. Phenology; signals, fruit size and fruit production. Dispersers: range of seed dispersers, frugivores as foragers. Animal adaptations – External and internal morphology, digestive physiology, behaviour. Factors limiting reciprocal, plant and animal specializations.</p>	7 Hours
	<p>4. Herbivores and green plants: Nutritional requirements of insects, seasonal and temporal distribution of nutrients in plant parts; Co-evolutionary arms race – plant defence and animal response; plant defence against herbivores – physical, chemical and ‘third party’ defences; animal responses – behaviour, detoxification, conjugation, target-site insensitivity, excretion. Herbivory vs plant fitness. Effect of herbivores on plant communities – The Janzen-Connell hypothesis. Effect of herbivores on plant communities. Hormonal interaction between plants and animals.</p>	9 Hours
	<p>5. Ant-plant interactions: Ant-plant symbioses – mutualism and non-mutualism (herbivores, harvesting ants, granivores and leaf-cutting). Ants as primary and secondary seed dispersers; pollination by ants; ant-fed plants and ant gardens; canopy ants; effects of harvesters on vegetation. Fungus growers.</p>	5 Hours
	<p>6. Carnivorous plants: Mechanisms of interaction between carnivorous plants and animals, trap mechanisms; nutritional benefits of carnivory.</p>	3 Hours
	<p>7. Plant communities as animal habitats: Adaptations,</p>	7 Hours

	<p>ecological segregation within and between habitats; mechanisms of habitat selection, effects of plants on animal spacing and aggression. Impact of invasive plants on native plant-animal interactions. Plant-animal interactions in agricultural ecosystems.</p> <p>8. Climate change and break down of plant-animal interactions; impact on community, diversity, productivity and livelihood.</p>	3 Hours
Pedagogy:	Lectures/ tutorials/assignments/self-study/field observations

Clarendon Press, Oxford.</p> <p>Willmer, Pat. 2011. Pollination and Floral Ecology. Princeton University Press</p>	
Learning Outcomes	<p>Would have understood intricate evolutionary relationships between plants and animals including their interdependence.</p> <p>Should have learnt the role of herbivory in phytochemical evolution and its importance in plant based drugs.</p> <p>Would have understood the importance of multicultural practices in the control of pests, organic farming and reduction of chemical pesticides.</p> <p>Able to appreciate the ecosystem services through these plant-animal interactions.</p> <p>Understand the effect of climate change on these interactions, conservation and survival of human species.</p>	

Programme: M. Sc. (Botany)

Course Code: BOO-224

Title of the Course: Post Harvest Technology for Fruit Crops.

Number of Credits: 2

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of basic Botany and fruit crops at UG level.	
Objective:	The paper deals postharvest technology and processing of various fruit crops. Maturity indices, postharvest physiology, various storage and packaging methods, principles and processing of various fruits, value added products and postharvest diseases are discussed.	
Content:	<p>1. Introduction to post-harvest technology, tropical fruits, major fruit crops of Goa, post-harvest and processing status of Kokum (<i>Garcinia indica</i>), maturity indices, harvesting practices for specific market requirements, influence of pre-harvest practices.</p> <p>2. Enzymatic and textural changes, respiration, transpiration, temperature, physiology and biochemistry of fruit ripening, ethylene evolution and</p>	<p>5 hours</p> <p>5 hours</p>

	<p>ethylene management, factors leading to post-harvest loss, pre-cooling.</p> <p>3. Treatments prior to shipment - chlorination, waxing, chemicals, bio-control agents and natural plant products. Methods of storage-ventilated, refrigerated, modified atmospheric storage (MAS), controlled atmospheric storage (CAS), physical injuries and disorders.</p> <p>4. Packing methods and transport, principles and methods of preservation, food processing, canning, fruit juices, beverages, pickles, jam, jellies, candies.</p> <p>5. Dried and dehydrated products, nutritionally enriched products, fermented fruit beverages, packaging technology, processing waste management, food safety standards.</p>	<p>5 hours</p> <p>5 hours</p> <p>4 hours</p>
Pedagogy:	Lectures/Moodle/ Tutorials/Assignments/Seminars/Self-Study

Learning Outcomes	<ol style="list-style-type: none"> 1. To enable students to understand the importance of traditional knowledge systems in ethnobotany important for GIP and pharma industry. 2. Acquire ability to interact with tribals and other medicinal practitioners and people having special knowledge of medicinal and other useful plants. 3. To develop career with NGOs involved in documenting tribal knowledge. 	

Programme: M. Sc. (Botany)

Course Code: BOO-226

Title of the Course: Remote Sensing: Techniques and Applications

Number of Credits: 3

Effective from AY: 2020-21

Prerequisites for the course:	Science back ground.	
Objectives:	Thousands of Remote Sensing satellites are circling the globe and continuously sending digital imageries. They have enormous application potential. However, technological advancement in this sphere is not duly supported by the trained human power to process and interpret the data. This introductory course deals with various aspects of Remote Sensing and their applications in forestry, ecology and Environment Impact Assessment.	
Contents:	<ol style="list-style-type: none">1. Principles and basic concepts of Remote Sensing: Principles of Electromagnetic Radiation; Interactions with Earth Surface Materials; Atmospheric Effects and atmospheric windows.2. Characteristics of Remotely Sensed Data: Spatial Resolution, Spectral Resolution, Radiometric Resolution, Temporal Resolution.3. Remote Sensors: Electro-Optical Sensors, Across-Track Scanning Systems, Linear-Array (Along-Track) Scanning Systems, Thermal IR Sensors, Microwave and Imaging Radar Sensors, Lidar.4. Digital Image Processing and Analysis: Feature Extraction, Radiometric Corrections, Geometric Corrections, Atmospheric Correction; image enhancement, extraction of information and classification; elements of image interpretation; Image Classification (supervised and unsupervised). Hyperspectral Image Analysis.5. Contemporary Satellites and Sensors: Overview; Resourcesat-2 (AWiFS, LISS-III, LISS-IV, S-AIS); Landsat 8 [Operational Land Imager (OLI), Thermal InfraRed Sensor (TIRS)]; historical data.6. Applications in Forestry and Ecology: Principles of image interpretation in forestry and ecology; principles	<div>4 Hours</div> <div>4 Hours</div> <div>5 Hours</div> <div>7 Hours</div> <div>4 Hours</div> <div>12 Hours</div>

	<p>of multispectral sensing for vegetation mapping; spectral response of vegetation and factors affecting the spectral response; change detection and monitoring; Environmental Impact Assessment using remote sensing and GIS; quantitative estimation of biomass and other ecological parameters; estimation and measurement of tree and stand height, crown diameter, crown count, crown density etc.; Principles of Remote Sensing in Landuse /Land cover mapping. Estimation of global gross and net productivity from Earth Observing Systems.</p>	
Pedagogy:	Lectures/ tutorials/assignments/self-study

W H Freeman and Company 1996.</p> <p>Weng, Qihao, 2011. An Introduction to Contemporary Remote Sensing. McGraw Hill Professional, 2011.</p>	
Learning Outcomes	<p>Clear understanding of the basics of Remote Sensing (RS). Theoretical base for processing and analysing the RS data. Ability to choose the type of RS data required for a given application.</p> <p>Methodological strength in applying the data in forestry, ecology and EIA.</p>	

Programme: M. Sc. (Botany)
Course Code: BOO-227
Title of the Course: Lab in Remote Sensing
Number of Credits: 1
Effective from AY: 2020-21

Prerequisites for the course:	Basic course in Remote Sensing (either attended earlier or attending simultaneously)	
Objectives:	Learn to process the Remotely Sensed data and interpret it.	
Contents:	1. Visual Interpretation of False colour Multi Band Imagery. (1) 2. Downloading free RS data (1) 3. Exploration of single band and multiple band images (1) 4. Contrast enhancement, calculation of histogram, linear stretching, and histogram equalization. (1) 5. Spatial enhancement – applying filters for enhancement. (1) 6. Geo referencing of digital images (2) 7. NDVI analysis and comparison with original data for interpretation. (1) 9. Image classification – Density slicing, interactive slicing. (1) 10. Unsupervised classification. (1) 11. Supervised classification. (1) 12. Presentation of results after analysis. (1)	
Pedagogy:	Hands on learning through computer software and visual interpretation.	
References/ Readings	ILWIS 3.0 User's Guide (https://www.itc.nl/ilwis/users-guide/)	
Learning Outcomes	Will be able to process the image using software, extract information and interpret it. Skill in ecoinformatics and environmental management with potential for employment.	

Programme: M. Sc. (Botany)
Course Code: BOO-329
Title of the Course: Applied Phycology: Utilization and Management
Number of Credits: 3
Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany.	
<u>Objective:</u>	To introduce the commercial applications of Algae and also their use in environmental management	
<u>Content:</u>	<u>1. Mariculture:</u> Scientific basis and Techniques of Mariculture Eucheuma, Porphyra and, Laminaria	3

	<p>technique. Rafts used in Mariculture Seaweed cultivation in India</p> <p>2. Food and food products from Seaweeds.</p> <p><i>Porphyra</i> as food: Cultivation and economics: Food and other uses, development of cultivation methods, present and future trends</p> <p><i>Spirulina</i> as human food: Nutritional aspects. Economic and environmental aspects. Therapeutic applications, Harvesting wild populations, Village scale production, Microalgal nutraceuticals and their production</p> <p>Cultivated edible kelps: Edible products, kelp composition, kelp production methods, world production</p> <p>Some public health aspects of microalgal products. Pheophorbide, Microbial contamination, Extraneous materials, metals, organic compounds, Maintaining sanitary quality</p> <p>3. Commercial production and application of algae: Hydrocolloids : History, Chemistry production and Application, future aspects of alginates, Carrageenans, Agars. Hydrocolloid resources of India</p> <p>Lipids and polyols from microalgae History of microalgal lipid production research, Triaglycerotl, Hydrocarban, , carotenoids, polyols</p> <p>Hydrogen production by algae: water splitting Role of algae in hydrogen production, principles of photosynthetic hydrogen production, Bio-photolysis of water.</p> <p>Products from fossil algae: Diatomite-industrial mineral, Calcareous algal fossils and their products algal kerogen in petroleum and coal,</p> <p>4. Algae in Environmental Management</p> <p>gae & Agriculture: Free living cyanobacteria and algalization, <i>Azolla</i>, Microalgal soil conditioners, Microalgal plant growth regulation, Seaweed use in agriculture and horticulture</p> <p>Microalgae in liquid waste treatment and reclamation. Biological waste treatment system, Design consideration (Algal concentration, algal productivity) Operation of integrated algal bacterial system, current application, future application (Sewage grown algae, energy system, toxin removal)</p> <p>Harmful Aspects of Algae</p> <p>arine dinoflagellates blooms: dynamics and impacts:</p>	<p>8</p> <p>8</p> <p>5</p>
--	---	----------------------------

	<p>Bloom dynamics: Initiation, growth, maintenance, Termination, Ecological and Economic impacts: Negative & Positive impacts. Harmful algal blooms in India</p> <p>Hazards of freshwater blue green algae: (Cyanobacteria) Neurotoxins, Hepatotoxins, other toxins, Medicinal aspects; Human poisoning, contact dermatitis</p> <p>Marine biofouling: Bacterial, Microalgal & Macroalgal biofouling, control treatments; antifouling coatings. Recent improvements in chemical control Methodology, Biological control, Non-adhesive surfaces</p> <p>6. <u>Algae in Future:</u></p> <p>Algae in space: Algae and life support systems; Algae and planetary biology, Future of algae in space.</p> <p>Algal Transgenics and Biotechnology</p>	<p>8</p> <p>4</p>
<u>Pedagogy:</u>	Lectures/ Tutorials/Assignments/Self-Study/ Visit to Research laboratories.

Learning outcome	<p>1. Be able to understand the role of algae in the field of Biotechnology, Environmental monitoring etc</p> <p>2. Have better prospects as researchers .</p>	

Programme: M. Sc. (Botany)

Course Code: BOO-322

Title of the Course: Plant Biotechnology.

Number of Credits: 3

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of Biotechnology.	
Objective:	To impart recent knowledge in the field of Plant Biotechnology beneficial to economy and industry.	
Content:	<p>1. Plant Tissue Culture: Totipotency; A brief history of plant tissue culture; Laboratory Organisation; Media Preparation, Cell Cultures (including Bergmann's plating technique).</p> <p>2. Applications of Plant cell, tissue and organ cultures: Applications in agriculture: improvement of hybrids, encapsulated cells, production of disease and stress</p>	<p>6 hours</p> <p>2 hours</p>

	<p>resistant plants. Applications in horticulture and Forestry;</p> <p>3. Applications in industries – Production of secondary metabolites; use of bioreactors.</p> <p>4. Micropropagation and somaclonal variation: Clonal propagation or micropropagation; Mechanism of somaclonal variation, Applications.</p> <p>5. Germplasm conservation: Modes of Conservation, Cryopreservation: Methods of cryopreservation, cryobank, Pollen bank; Prospects in agricultural and forest biotechnology.</p> <p>6. Production and uses of Haploids: Production of haploids (anther culture, ovule culture, bulbosum technique), detection of haploids (morphology, genetic markers); uses of haploids; Pollen as a tool in crop improvement; Pollen storage; Effect of radiation on pollen.</p> <p>7. Protoplast culture, regeneration and somatic hybridization: Isolation of protoplasts, Purification of protoplasts, viability and plating density of protoplast; protoplast culture and regeneration of plants; protoplast fusion and somatic hybridization, Cytoplasmic hybrids or hybrids, genetic modification of protoplasts.</p> <p>8. Transgenic Plants: Selectable marker genes and their use in transformed plants; Transgenic plants for crop improvement; Molecular farming from transgenic plants; Bioethics in plant genetic engineering.</p> <p>9. Gene transfer methods in plants: <i>Agrobacterium</i> mediated gene transfer; selectable and scorable markers (reporter genes), agroinfection and gene transfer, DNA mediated gene transfer (DMGT); Methods of direct gene transfer.</p> <p>10. Application of Biotechnology in Agriculture, Forestry and human welfare: Marker assisted selection (MAS); Production of Biopesticides; Environmental and Enzyme biotechnology.</p>	<p>2 hours</p> <p>3 hours</p> <p>4 hours</p> <p>6 hours</p> <p>6 hours</p> <p>2 hours</p> <p>2 hours</p> <p>3 hours</p>
Pedagogy:	Lectures/Assignments/Tutorials/Self study.

Dubey, R. C. 2009. A text book of Biotechnology. S. Chand & Co. Ltd. New Delhi.</p>	
<u>Learning Outcomes</u>	Able to work in Plant tissue culture laboratory, in Pharmaceutical and ayurvedic drug industries, research laboratories and plant germplasm banks.	

Programme: M. Sc. (Botany)

Course Code: BOO- 323

Title of the Course: Lab in Plant Biotechnology.

Number of Credits: 1 (24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Practical knowledge of Plant Biotechnology.	
Objective:	To train the students in practical aspects of plant biotechnology with special emphasis on somatic embryogenesis and organogenesis.	
Content:	<p>(Any practical's of total 30 hours duration)</p> <ol style="list-style-type: none"> 1. Familiarizing with various physical and chemical sterilization techniques. 2 hours 2. Preparation Murashige and Skoog (MS) Media. 4 hours 3. Preparation of explants and inoculation. 2 hours 4. Leaf and node culture. 2 hours 5. Stem culture. 2 hours 6. <i>In vitro</i> embryo culture of <i>Pisum sativum</i>. 2 hours 7. Seed culture. 2 hours 8. Anther culture using Datura flower. 2 hours 9. Preparation of cell suspension cultures. 4 hours 10. Study of cell viability methods. 2 hours 11. Isolation of protoplast from plant leaves by enzymatic method. 4 hours 12. Isolation of protoplast from plant leaf by mechanical 4 hours 	

	<p>method.</p> <p>13. Study of protoplast viability.</p> <p>14. Root organ culture (ROC) technique.</p> <p>15. Preparation of synthetic seeds (alginate beads).</p>	<p>2 hours</p> <p>4 hours</p> <p>2 hours</p>
Pedagogy:	Laboratory Practicals.

Learning Outcomes	Able to work in Plant tissue culture laboratory, in Pharmaceutical and ayurvedic drug industries, research laboratories and plant germplasm banks.	

Programme: M. Sc. (Botany)

Course Code: BOO-324

Title of the Course: Mycorrhizal Biotechnology.

Number of Credits: 2

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of Mycology.	
Objective:	To familiarize the students with various aspects of Mycorrhizal fungi, study techniques and their applications.	
Content:	<ol style="list-style-type: none">1. Biofertilizers: Definition, types, characteristic features, their role and importance in sustainable agriculture.2. Mycorrhiza: Definition and historical perspective; Types of mycorrhizae; classification; Phylogeny; general importance.3. Mycorrhizal Techniques: Isolation and pure culture preparation of ecto- and endo-mycorrhizae; Criteria for identification - generic and specific level; staining techniques; Trap and pure cultures; <i>in vitro</i> culture of AM fungi, commercial production of inoculum.4. Molecular and cell biology of AM symbiosis: Fungal partner; Model plants in AM research; Cytological features of AM plant roots; Root to fungus signaling in AM symbiosis – Asymbiotic phase, presymbiotic phase and symbiotic phase; Fungus to root signaling in AM symbiosis – Presymbiotic phase and symbiotic phase; Transfer of nutrients between plants and fungi; Defense reaction during colonization; Signaling pathways in AM fungi.5. Phosphate transport and role of AM fungi: Sources of Phosphorus, P uptake from environment; Plant phosphate transporters; Phosphate transport in AM fungi. (2h)6. Phytohormones and AM symbiosis: Cytokinins, Gibberellins, Ethylene, ABA, Auxins, Salicylic acid, Jasmonic acid; Role of Jasmonates in mycorrhization.7. Ecology of AM fungi: Mycorrhiza formation in field soil; effects of N and micronutrients. Microbial interactions, phytoremediation; Effects upon AM fungi – disturbance, agrochemicals and grazing.8. Production of ectomycorrhizal fungal inocula and inoculation procedures: Types of ectomycorrhizal inocula; Methods of preparation, inoculum procedures.9. Arbuscular Mycorrhizae in phytoremediation:	2 hours 2 hours 3 hours 4 hours 3 hours 2 hours 3 hours 3 hours 2 hours 4 hours

	Phytoremediation – definition, advantages and limitations; Contaminated and uncontaminated soils, heavy metals and their effects in plants; Heavy metal detoxification mechanisms in plants and AM fungi; Phytostabilization and phytoextraction; Glomalin and its role; concepts for improving phytoremediation by plant engineering.	
Pedagogy:	Lectures/Assignments/Tutorials/Self study.

Learning Outcomes	Better prospects in agro-based industries.	

Programme: M. Sc. (Botany)

Course Code: BOO-325

Title of the Course: Lab in Mycorrhizal Biotechnology.

Number of Credits: 1 (24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of Mycology.	
--------------------------------------	------------------------------	--

Objective:	Exercises are designed so that the students will have hands on training in mycorrhizal biotechnology and development.	
Content:	<ol style="list-style-type: none"> 1. Isolation of AM fungal spores from rhizosphere soil. 2. Estimation of AM fungal spore numbers. 3. Techniques of staining roots for AM colonization. 4. Histochemical staining for polyphosphate granules in AM fungal hyphae using Toluidine blue O (TBO). 4. Histochemical staining for lipid bodies in AM fungal hyphae and vesicles using Sudan Black. 5. Preparation of AM fungal inocula: trap and pure cultures. 6. Identification of some commonly occurring AM fungal species based on spore morphology. 7. <i>In vitro</i> culture of AM fungi. 	2 hours 4 hours 4 hours 2 hours 2 hours 6 hours 6 hours 4 hours
Pedagogy:	Laboratory Practicals.

Learning Outcomes	Better prospects in agro-based industries.	

Programme: M. Sc. (Botany)
Course Code: BOO-326
Title of the Course: Plant Histochemistry
Number of Credits: 2
Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of basic Botany at UG level.	
Objective:	The paper deals with various applications of histochemical and microscopic techniques to understanding the structure and development of plants. Principles, instrumentation and applications of all microscopy are learnt. Methods and procedures for localization of various storage compounds such as carbohydrates, protein, lipids, minerals such as calcium, potassium, iron and other chemical compounds present in different parts of plants using fluorescent and non fluorescent dyes are discussed.	
Content:	<p>1. Introduction to basic histology: Cells and tissues and microorganisms.</p> <p>2. General Techniques: Chemistry and practice of fixation; whole mounts; sectioning- microtomy, cryo and ultra-microtomy; freeze-drying of biological materials.</p> <p>3. Microscopy: Light matter interaction and its significance; Kohler illumination; Principles, instrumentation and applications of bright-field, polarization, phase-contrast, fluorescence, confocal, scanning and transmission electron microscopy; image analyzing system.</p> <p>4. Cyto and histochemistry with bright-field microscopy: Single and double staining protocols; localization of various biogenic components such as carbohydrates, proteins, lipids, nucleic acids, phenolic compounds, lignins, cutins, suberin, waxes, minerals such as calcium, potassium, irons and other metals.</p> <p>5. Polarization microscopy: Study of structure and components of cell wall, starch, crystals and other anisotropic materials.</p> <p>6. Fluorescence microscopy: Auto-fluorescence in biological materials; fluorochromes; excitation filters; localisation of proteins, lysine rich proteins, lipids, nucleic acids, phytins, phenolic compounds, lignins and cutins in various biological tissues using fluorescent dyes; Role of FITC-bound dextrans and vascular tissue specific fluorochromes in biology; study of cell membranes, connective tissues, protoplasts and infected materials.</p> <p>7. Electron microscopy: Specimen preparation for TEM</p>	<p>1 hour</p> <p>2 hours</p> <p>8 hours</p> <p>3 hours</p> <p>1 hour</p> <p>3 hours</p> <p>1 hour</p>

	<p>and SEM.</p> <p>8. Enzyme histochemistry: Localization of esterases; phosphates and other enzymes.</p> <p>9. Photomicrography: Basic techniques of image capturing and image analysis using bright-field, polarization, dark-field and fluorescence microscopy; Conventional and digital photography; basic principles, cameras, lenses, focusing, exposure, resolution, depth of field, lighting, keeping and storing records.</p> <p>10. Cyto-histochemistry and its applications: Understanding biological structures of medicinal and other economically important plants; Applications in diagnostic and analytical sciences and biotechnology.</p>	<p>1 hour</p> <p>2 hours</p> <p>2 hours</p>
Pedagogy:	Lectures/ Tutorials/Assignments/Seminars/Self-study.

	Principles and Practice. W. H. Freeman and Company, San Francisco, USA.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to gain insight in fine structure of plant tissues and apply the knowledge of histochemical and microscopic techniques to understand development of various plant species. 2. Being in position to select appropriate stains to differentiate plant tissues in different stages of development. 3. Being able to apply methods and procedures for localization of various compounds, enzymes, minerals etc. 4. Better prospects in pharmacognosy. 	

Programme: M. Sc. (Botany)

Course Code: BOO-327

Title of the Course: Lab in Plant Histochemistry.

Number of Credits: 1 (24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of basic Botany at UG level.	
Objective:	To learn and understand various microscopic and histochemical techniques. Localization of various storage compounds such as starch, protein, lipids and other compounds using various fluorescent and non-fluorescent dyes.	
Content:	<ol style="list-style-type: none"> 1. Study of auto-fluorescence in biological specimens using UV, violet, blue and green excitation filters under fluorescence microscopy. 2. Localization of proteins in biological tissues using fluorescent and non-fluorescent dyes. 3. Localization of lipids in biological tissues using fluorescent and non-fluorescent dyes. 4. Study of cell wall structure using the specific fluorochrome like calcofluor white or acridine orange using fluorescence microscopy. 5. Study the distribution of starch in biological specimens using iodine potassium iodide. 6. Study the structure of starch, stomata, crystalline and other anisotropic materials using polarization microscopy. 7. Examination of normal and diseased plant tissues using fluorescence microscopy. 8. Localization of plant cell nuclei using fluorescent and non-fluorescent dyes. 	<p>2 hours</p> <p>2 hours</p> <p>2 hours</p> <p>2 hours</p> <p>2 hours</p> <p>2 hours</p> <p>2 hours</p> <p>4 hours</p>

	9. Localization of minerals such as calcium, potassium and iron in biological tissues.	6 hours
	10. Microphotography using bright-field, dark-field, polarization and fluorescence microscopy.	2 hours
	11. Demonstration of image capture, image analysis, measurement of various parameters of cells and tissues using image analyzing software.	2 hours
	12. Demonstration of scanning electron microscopy.	2 hours
Pedagogy:	Hands on Practical.

(2009) Paleobotany:</p>	

	The biology and evolution of fossil plants. 2 nd edn: Academic Press Amsterdam.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to understand evolution of plants in geological epochs. 2. Being able to understand importance of fossil plants in conservation. 	

Programme: M. Sc. (Botany)

Course Code: BOO-436

Title of the Course: Marine Phytoplanktons

Number of Credits: 1

Effective from AY: 2020-21

<u>Prerequisites for the course:</u>	Should have studied B. Sc. Botany	
<u>Objective:</u>	Microalgae can be identified only after preservation. Each algal group has different preparatory technique required for its basic identification with light microscope. This paper introduces these techniques, along with general characteristics, taxonomy, ecological and economic importance	
<u>Content:</u>	<p>Introduction and Ecological Roles</p> <p>Marine Diatoms: General characteristics, Life cycle, Morphology and terminology with respect to centric and pennate diatoms</p> <p>Marine Dinoflagellates: General characteristics, Morphology and terminology, Microanatomy, Taxonomy and preparation techniques</p> <p>Planktonic Microflagellates: General characteristics, Morphology and terminology, Taxonomy of Chromophyta, Cryptophyta and Raphidophyta, Chrysophyta (Dictyochophyceae, Prymnesiophyceae-Haptophyceae)</p> <p>Chlorophyta (Euglenophyta, Prasinophyta and Chlorophyta)</p> <p>Coccolithophorids: Holococcolithophorids and heterococcolithophorids</p> <p>Identification, Collection, preservation and preparation techniques</p>	<p>3 hours</p> <p>3 hours</p> <p>4 hours</p> <p>2 hours</p>
<u>Pedagogy:</u>	Lectures/ Tutorials/Assignments/Self-Study	
<u>References/Readings</u>	<p>Fritsch, F.E. (1935). The Structure and Reproduction of the Algae. Cambridge University Press.</p> <p>Hallegraeff, G.A. (1993). A review of harmful algal blooms and their apparent global increase. Phycologia 32, 79-99.</p>	

	<p>Hallegraeff, G.M., Anderson, D. M. and Cembella, A.D. (2003). Manual on Harmful Marine Micro-algae. UNESCO.</p> <p>Hargraves, P.E. and French, F.W. (1983). Diatom resting spores: Significance and strategies. In: Fryxell, G. A. (Ed.), Survival Strategies of the Algae. pp. 49-68. Cambridge: Cambridge University Press.</p>	
<u>Learning outcomes</u>	<p>1. To be able to identify the marine microalgae with a proper knowledge of collection and preparation techniques for different algal groups.</p> <p>2.To be able to work as consultant/ Assistant in Environmental monitoring Programme</p>	

Programme: M. Sc. (Botany)

Course Code: BOO- 440

Title of the Course: Bioentrepreneurship and Innovation.

Number of Credits: 1

Effective from AY: 2020-21

Prerequisites for the course:	History of scientific ideas, research methodology, biotechnology at UG level.	
Objective:	Impart knowledge and work experience based/case study based training to students in the field of innovation and uses of various biology/ biotechnology based products, goods, services employed in bioentrepreneurship.	
Content:	<p>1. Entrepreneurship in the Life Sciences.</p> <p>2. Development of Products in the Biomedical Industry.</p> <p>3. Integration of science, technology and business.</p> <p>4. From Lab to land: scope in agro/food processing industry</p> <p>5. Industrial management.</p> <p>6. Market analysis.</p> <p>7. Business development.</p> <p>8. Regulatory mechanisms.</p> <p>9. Indian bioentrepreneurial scenario.</p> <p>10. Case studies of successful bioentrepreneurs.</p>	<p>1hour</p> <p>1hour</p> <p>1hour</p> <p>1hour</p> <p>1hour</p> <p>2hourr</p> <p>2hours</p> <p>1hour</p> <p>1hour</p> <p>1hour</p>
Pedagogy:	Lectures/ Tutorials/Assignments/Seminars/Group Discussion/Expert Lectures/Videos/Mini projects/Moodle based guidance/Self study.

Learning Outcomes	<ol style="list-style-type: none"> 1. To be able to prepare a business plan and launch career as bioentrepreneur. 2. Being able to get employment in a bioindustry or a bioconsultancy. 	

Programme: M. Sc. (Botany)

Course Code: BOO-441

Title of the Course: Lab in Bioentrepreneurship and Innovation.

Number of Credits: 1 (24 hrs)

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of biology and biotechnology, biotech based industries and brands, IPR issues	
Objective:	To train students for bioentrepreneurship based self employment	
Content:	<p>Students would be given short orientation and assigned / placed in a typical bioindustry and would work under guidance of the nominee of the company for duration at the work place equivalent to 12 hours to produce a report in prescribed format. The report needs to be submitted before end of the semester.</p> <ol style="list-style-type: none"> 1. Internship orientation case studies 2. Shop floor briefing at company 	<p>2 hours</p> <p>2 hours</p>

	3. Company assigned internship at the site 4. Weekly Report preparation 5. Terminal report preparation	15 hours 2 hours 3 hours
Pedagogy:	Lectures/Videos/Interviews/Industrial apprenticeship

Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to launch career as bioentrepreneur. 2. Being able to work as a consultant for bioindustries. 3. Being able to find employment in a biobased production or marketing industry. 4. Being able to do biomarket analysis and prepare a biobusiness plan. 	

Programme: M. Sc. (Botany)

Course Code: BOO- 442

Title of the Course: Mushroom Biotechnology.

Number of Credits: 1

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of mushrooms at UG level.	
Objective:	Train the students in the field of diversity, biology of mushrooms in wild and biotechnology of mushrooms produced commercially with stress on edible and	

	medicinal species, knowledge on toxic species and focus on mushroom production and marketing.	
Content:	<ol style="list-style-type: none"> 1. Edible and medicinal mushrooms, criteria for edibility, domestication of edible and medicinal mushrooms. 2. Mushroom biotechnology principles- as applied to commercial species (top six). 3. Spawn development and quality parameters, 4. Production and quality management. 5. Harvesting, grading, branding, marketing. 6. Mushrooms-post harvest processing and value addition. 7. Mushroom marketing, scope for new species, scope in tropical countries. 8. Future of mushroom industry-global, national, local perspectives. 	1hour 2hours 1hour 2hours 2hours 1hour 2hours 1hour
Pedagogy:	Lectures/ Tutorials/Assignments/Seminars/Videos/Moodle based guidance/Expert Lectures/Self study.

Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to appreciate the ethnomycological traditions and role of edible mushrooms in culture and economy. 2. Being able to analyse mushroom production and marketing trends. 3. Being able to work in a mushroom industry. 	

Programme: M. Sc. (Botany)

Course Code: BOO- 443

Title of the Course: Lab in Mushroom Biotechnology

Number of Credits: 1(24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of mycology, ethnomycology, microbiological techniques	
Objective:	To train students in various aspects of production, quality evaluation and marketing of edible mushrooms and their nutritional importance	
Content:	<ol style="list-style-type: none"> 1. Identification of mushroom habitats. 2. Identification of edible, medicinal and toxic mushroom species. 3. Obtaining and studying mushroom spore prints. 	2 hours 2 hours

	4. Developmental biology of local wild mushrooms. 5. Preparation of pure mushroom cultures. 6. Production of SCP from submerged culture of edible mushrooms. 7. Production and evaluation of mushroom spawn. 8. Oyster mushroom cultivation using tissue paper rolls 9. Mushroom quality evaluation- button or oyster mushrooms. 10. Report on Button mushroom industry after field visit.	1 hour 2 hours 2 hours 4 hours 4 hours 4 hours 2 hours 1 hour
Pedagogy:	Practical Exercises, Mini Projects, Hands on demos, Videos, Moodle based guidance.	
References/Readings	1.Arora, D. (1986). Mushrooms demystified: A comprehensive guide to the fleshy fungi. Berkeley: Ten Speed Press. 959 pp. 2.Kuo, M. (2007). 100 Edible Mushrooms. Learning Outcomes	1. Ability to cultivate edible mushrooms. 2. Ability to produce quality mushroom spawn. 3. Better prospects to work in a mushroom farm or factory. 4. Ability to produce consultancy reports on mushroom marketing and production. 5. Ability to launch value added mushroom processing enterprises. 6. Ability to promote edible mushrooms as nutraceuticals. 7. Ability to work as master trainer in mushroom cultivation camps or workshops for women, SC, ST.	

Course Code: BOO- 447

Title of the Course: Ecotourism.

Number of Credits: 2

Effective from AY: 2020-21

Prerequisites for the course:	General idea of tourism. Flora and fauna of western ghats of Goa, history and culture of India.	
Objective:	Supported by local tourism industry this need based course is to make the students to opt various ecotourism programmes as a self employment stream; to make the students to aware about the usefulness of ecotourism in the conservation of natural resources, and to help the students to assess various ecotourism programmes.	
Content:	<p>1. Eco-tourism: Definition, concept, introduction, history, relevance and scope.</p> <p>2.Key Principles and Characteristics of Ecotourism:Nature area focus, interpretation, environmental sustainability practice, contribution to conservation, benefiting local communities, cultural respect, customer satisfaction, responsible marketing.</p> <p>3. Components of Ecotourism:Travel, tourism industry, biodiversity, local people, cultural diversity, resources, environmental awareness, interpretation, stake holders, capacity building in ecotourism.</p> <p>4. Eco Tourism Terms:Adventure tourism, certification, commercialization chain, cultural tourism, canopy walkway, conservation enterprises, ecosystem, ecotourism activities, ecotourism product, ecotourism resources, ecotourism services, endemism, ecolabelling, ecotourism “lite”, geotourism, greenwashing, stakeholders, sustainable development, sustainable tourism, leakages.</p> <p>5. Ecotourism resources in India and Goa:Major ecosystems, vegetation types, biodiversity and tourism areas in Goa. Festivals and events, entertainment overview, culture, famous destinations, sightseeing, historical monuments, museums, temples, national parks & wildlife sanctuaries, hill stations, waterfalls, rivers, lakes, beaches, islands, mangroves, backwaters, wildlife watching and bird watching sites, rural handicrafts, tribal medicines, archeological sites, adventure sports, sacred groves, mountains, etc.</p> <p>6. Forms of Ecotourism in India, Western Ghats and Goa:Eco regions, eco places, western ghats of Goa, waterfalls in Goa and India, eco travel, dos and don't on eco travel, eco trips. Potentials of ecotourism in Goa.</p>	<p>1hour</p> <p>1hour</p> <p>2hours</p> <p>4hours</p> <p>7hours</p> <p>4hours</p>

	<p>Community based ecotourism, ecotourism and NGOs.</p> <p>7.Ecotourism Planning: Background, objectives, strategy, design of activities, target groups, opportunities, capacity building, threats, expectations positive and negative impacts, strength and weakness, benefits and beneficiaries, stakeholders, linkages, economics, ecotourism auditing. Problems with ecotourism. Carrying capacity of ecotourism. ecotourism facilities – Green report card. Ecotourism management – issues.</p> <p>8. Ecotourism and livelihood security: Community, biodiversity conservation and development – Eco-development committees.</p>	<p>3hours</p> <p>2hours</p>
Pedagogy:	Lectures/ Tutorials/Videos/Films/Group Discussion/Expert Lectures/Assignments/Self-Study	
References/Readings	<p>1.A K Bhattacharya. 2005. Ecotourism and Livelihoods. Concept Publ. Company, New Delhi.</p> <p>2.Kreg Lindberg, Deonal E. Hawkins. 1999. Number of Credits: 3

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of environment, environmental issues, earth system processes, weather parameters, geography and basic ecology and biodiversity at U.G. Level.	
Objective:	This course specially catered to needs of students in a world facing challenges of global warming discusses modules from ecology of climate change, carbon trading to tropical soil ecology, chemical ecology, industrial and urban ecology, landscape ecology, environmental impact assessment and encourages the students to use online tools, software, GIS, satellite images, toposheets besides interesting field and laboratory exercises. The students are exposed to state of the art developments in ecology and current issues affecting the planet with special emphasis on tropical environment, western ghats, Arabian sea and issues like urbanization and sustainable development.	
Content:	<p>1. Ecology of climate change and development (ECCD): Climate change-the current picture after COP-21; Importance of findings of AR-5 of IPCC; Climate change and biosphere; ecosystems; biodiversity; diseases, bioinvasion and invasive species; pollution; Climate change and global agriculture; water resources; impact on India's biomes; animal and human populations; The Indian response to climate change, 4 X 4 report of MOEF; Adapting to climate change in 21st Century, efforts for mitigation, CDM, Carbon trade, Carbon credits.</p> <p>2. Chemical ecology (CE): Understanding basic terminology such as pheromones, kairomones, allomones, semiochemicals; interactions by chemical substances, i.e. semiochemicals, between animals, plants and environment; Importance of chemical communication in living organisms, , fungicides and herbicides used in gardening, agriculture and forestry, advantages – disadvantages with biological control</p>	<p>5hours</p> <p>4hours</p>

	<p>methods; tropical case studies-social insects such as dampwood and mound building termites.</p> <p>3. Tropical Soil Ecology (TSE): Classification and characteristics of tropical soils; Soils as a biological habitat, tropical Soil biodiversity; Organic matter decomposition by microbes in oxic and anoxic environments, Soil microbial groups based on metabolism and respiration; Humus formation and humic matter in tropical soils; role and importance of Soil enzymes; Carbon and nitrogen ratios and other factors affecting mineralization and immobilization of nutrients; tropical Forest soils; Earthworms and composting.</p> <p>4. Landscape and plant ecology (LE): Historical development, Applications of landscape ecology, Definitions and terminology in LE, Pattern, heterogeneity, patches, Scale and hierarchy on landscapes; Change and long temporal scales; Causes of pattern; Landform and landscape position; Land use-Social and cultural landscapes; The role of disturbance on landscapes-Spatial dynamics of disturbance, Disturbance, equilibrium, and scaled landscapes, Principles of plant ecology, plant communities, ecotones, edge effect; Forest landscape succession-Succession as a spatial process, Landscape restoration, Landscape management: Natural variability, scientific uncertainty, and sustainability; Case studies from India-habitat fragmentation in western ghats, in mining areas etc.</p> <p>5. Urban and industrial ecology(UIE): Ecology of towns and cities, urban ecosystems; urbanization in tropical countries; sustainable urbanization, Ecological cities, techniques in Conservation of Urban biodiversity and urban forestry; Case studies of model cities and towns e.g. Curitiba-Brazil; Smart cities in India, , What is Industrial Ecology?, Environmental Paradigm, Sustainability: Concepts and Metrics, Materials flow and Life cycle assessment (LCA), industrial ecosystems, case studies e.g. Kalundberg, Thane.</p> <p>6. Ecological economics (EE), Environmental valuation and auditing (EA): Basics of EE; Polluter pays principle; Gross national and gross natural products; Natural resources accounting procedure (NRA); techniques used in NRA; evaluation of ecosystem services; fundamentals of bioeconomics; Work by costanza and others; How to assess environmental</p>	<p>3hours</p> <p>7hours</p> <p>6hrs</p> <p>6hours</p>
--	--	---

	<p>performance of a company or organisation, with appropriate case studies; Importance of EE in national planning and development.</p> <p>7. Environmental impact assessment (EIA): History of EIA, EIA, EIS, EMP; EIA laws and regulations, projects requiring EIA in India; EIA methodology- Checklist, overlay, modeling, Network, Matrix, computer assisted; EIA software packages and tools; Biological impact assessment; preparing EIA reports, public hearing procedures; EIA case studies from India; Study of EIA manuals.</p>	5hours
Pedagogy:	Lectures/Tutorials/Assignments/Seminars/Self-study/Videos/Moodle/Expert Lectures/Group Discussion/Mini Projects/Workshops

Programme: M. Sc. (Botany)

Course Code: BOO - 450

Title of the Course: Lab in Advanced Ecology.

Number of Credits: 1 (Total sessions 24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of field work, sampling theory, on line weather monitoring, chemical and microbiological analysis, use of maps and charts, software tools, ecoinformatics, Google Earth.	
Objective:	To impart knowledge of field , lab and IT based ecological techniques in a world affected by global warming and climate change and to equip students to independently analyze any environmental issue and where possible think of appropriate solutions in a studious manner.	
Content:	<ol style="list-style-type: none"> 1. Analysis of IPCC data on climate change. 2. Analysis of ICE core data for temperature and carbon di-oxide levels. 3. Analysis of Mauna Kea data for Carbon dioxide levels. 4. Using online weather monitoring systems and generating reports-sea level gauges. 5. Study of proxies for sea level fluctuations- marine fossils. 6. Sampling and analysis of rainwater for physicochemical and biological/microbiological constituents. 7. Detection of chemical trails of ants and termites. 8. Responses of ants and termites to different chemicals. 9. Field observations on termite hill and fungus combs. 10. Analysis of vermicasts for organic matter, micronutrients. 11. Study of ecotones and edges in natural ecosystems. 12. Application of quadrat studies in landscape science. 13. Analysis of soil humic matter. 14. Detection of soil enzymes using chromogenic substrates. 15. Isolation of soil microbiota and assessment of their ecological role. 16. Landscape analysis and modeling using software tools. 17. Study of local landscapes using maps and satellite images. 	<p>Total 12 sessions, All sessions of 2 hours each, any 3 from 1-6; any 2 from 6 to 10; any 2 from 11 to 15; any 2 from 16 to 22 and any 3 from 23 to 30</p>

	<p>18. Landscape analysis using satellite imagery data using Google Earth <i>etc.</i></p> <p>19. Study of land use change -urbanization, mining, tourism using Google Earth.</p> <p>20. Cataloguing urban land use and biodiversity using maps and field data.</p> <p>21. Conceptualizing a model urban ecosystem using design tools.</p> <p>22. Flowcharting/drawing an industrial ecosystem.</p> <p>23. Evaluating local ecosystem services using standard equations (Costanza, 1997).</p> <p>24. Conceptualizing rainwater harvesting system for an industrial estate.</p> <p>25. Performing Rapid EIA using Leopold interaction matrix (different projects).</p> <p>26. Study of technical reports on Solid Waste Management.</p> <p>27. Software for EIA –solid waste management.</p> <p>28. Performing rapid biological impact analysis.</p> <p>29. Preparation of Infographics on different ecological themes.</p> <p>30. Production of a brochure on given ecological themes.</p>	
Pedagogy:	Lectures/ Tutorials/Assignments/ Mini Projects/Use of software tools and online websites/Moodle based Exercises/ Videos/ Demonstrations/ Field visits/Self-study/Expert Lectures/Training workshops.	
References/Readings	Dietland Müller-Schwarze (2009). Hands-On Chemical Ecology: Simple Field and Laboratory Exercises.	
Learning Outcomes	<ol style="list-style-type: none"> 1. To be able to use IPCC data on global warming. 2. To be able to use IT based platforms for monitoring weather and sea level changes. 3. Ability to work as a tropical field ecologist. 4. Use Google Earth effectively for various purposes. 5. Be able to independently work as EIA consultant or urban forestry consultant. 6. Be able to participate in Smarts city projects planning and execution. 7. To begin career as ecological consultant. 8. Better scope as environmental journalist. 9. Better scope to work for environmental NGOs. 	

Programme: M. Sc. (Botany)
Course Code: BOO-451
Title of the course: Plant Biochemistry
Number of Credits: 3
Effective from AY: 2020-2021

<u>Prerequisites for the course:</u>	Students should have studied B. Sc. Botany with a basic knowledge of plant physiology and biochemistry at the UG level.	
<u>Objective:</u>	This paper provides the deeper understanding of isomerism of biomolecules, biomembranes, bioenergetics and regulation of metabolic pathways in plants. Students will also learn mechanism of enzyme action with introduction to cellular and molecular mechanism of signal transduction.	
<u>Content:</u>	<p>1. Biomolecules: Structure, function and isomerism: Organization and composition of eukaryotic cells; integration and control of cellular functions; amino acid composition of proteins; higher levels of protein organization; dynamic aspects of protein structure and protein stability. Plant biopolymers: Cellulose, hemicellulose, xylan and pectin. Biominerals in plant such as phytoliths and calcium oxalate.</p> <p>2. Mechanism of enzyme action: Introduction to enzymes; Michaelis-Menten model; enzyme kinetics as an approach to understanding mechanism; enzymatic reactions; regulatory enzymes; reversible and irreversible covalent modifications of enzymes.</p> <p>3. Metabolic pathways and regulation: Major metabolic pathways and their regulation; biosynthesis of amino acids; purine and pyrimidine metabolism; metabolic interrelationships; biosynthesis of vitamins.</p> <p>4. Biomembranes and Bioenergetics: Physico-chemical properties of biological membranes; their distribution and organization; intrinsic and extrinsic proteins; transport of biomolecules across membrane; passive and active transport; role of membrane in cellular metabolism. Bioenergetics: Thermodynamics; exergonic and endergonic reactions; redox potential; high energy compounds; ATP structure and its significance.</p> <p>5. Expression and signal transduction: Gene expression in eukaryotes; genetic control of enzyme synthesis; cell surface receptors; G proteins coupled secondary messenger and response to</p>	<p>10 hours</p> <p>6 hours</p> <p>8 hours</p> <p>8 hours</p> <p>4 hours</p>

	environmental changes and other stimuli.	
<u>Pedagogy:</u>	Lecture through PPT/e-learning/Assignments/Seminars/Self study

<u>Learning Outcomes:</u>	Students will be able to demonstrate a depth of knowledge of biochemical processes together with a better understanding of interaction and regulation of various metabolic pathways.	

Programme: M. Sc. (Botany)

Course Code: BOO-452

Title of the course: Lab in Plant Biochemistry

Number of Credits: 1

Effective from AY: 2020-2021

<u>Prerequisites for the course:</u>	Knowledge of the subject at UG level to be able to prepare various types of solutions, and handle basic laboratory tools and techniques.	
<u>Objective:</u>	This course is designed primarily to relate the learning of concepts in classroom to demonstrate experimental foundation of underline concepts/principles mainly on aspects of biomolecules, its metabolic processes and enzymes.	

<u>Content:</u>	1. Extraction and estimation of proteins from plants. (2P) 2. Extraction and estimation of amino acids from plants. (2P) 3. Extraction and estimation of total sugar and reducing sugars from plant samples. (2P) 4. Separation of protein by PAGE (preparation of gel, preparation of protein sample, running, development and documentation of gel). (3P) 5. Extraction and purification of lipids from leaf samples. (1P) 6. Separation of glycolipids, phospholipids and neutral lipids (chromatographically). (3P) 7. Quantitative estimation of phospholipids and glycolipids (spectrophotometrically). (2P) 8. Activity of enzyme phosphoenol pyruvate carboxylase (PEPC). (1P) (Note: Any 10 practical exercises will be conducted.)	4 hours 4 hours 4 hours 6 hours 2 hours 6 hours 4 hours 2 hours
<u>Pedagogy:</u>	Wet laboratory exercises

<u>Learning Outcomes:</u>	Students will be able to develop competence in handling various biochemical techniques and apply them in isolating and analyzing different biological molecules.	

Programme: M.Sc. (Botany)

Course Code: BOO-453

Title of the Course: Introduction to Omics

Course Credit: 3

Effective from AY: 2020-2021

<u>Prerequisite for the Course:</u>	Should have basic knowledge of structure of genome, genes, structure of proteins, metabolism.	
<u>Objective:</u>	This course will make students familiarize with terminology, underlying principals and methodology in genomics, transcriptomics, proteomics and metabolomics. Thrust of the paper is Protein dynamics, protein trafficking machinery and autophagy for protein turnover. The role of protein networks in mediating cellular responses and transmitting signals will be highlighted with emphasis on giving relevant examples for the use in future research work.	
<u>Content:</u>	<p>1. Genomics: Classical genomics, Mendelian Genetics, Forward/Reverse Genetics, Linking Genotype and phenotypes, use of mutants. Large Scale genomic Sequencing: Platforms for next generation sequencing (NGS), whole genome sequencing, targeted sequencing, ChIP sequencing, Applications of Genome sequencing. Epigenetic regulation in Plants, DNA methylation, Histone modification, Plant Mediator Complex. Transcriptomics: Differential expression, Alternate splicing, RNA sequencing, ENCODE, Epigenomic analysis.</p> <p>2. Proteomics: Protein structure and function, amino acids, peptides, protein synthesis. Post translational modification of proteins: Glycosylation, Phosphorylation, Acetylation, Methylation, Ubiquitinylation, Identification of post-translational modification in proteins, protein phosphorylation assay. Protein transport and Secretion, Protein targeting and trafficking, ER Golgi dynamics in protein sorting, dynamics of membrane bound protein, mechanism of protein secretion. Protein degradation: Ubiquitin-proteasome pathway, Lysosomal Proteolysis, role of autophagy and vesicular trafficking in degradation of protein. Essentials of Protein-protein interaction: Protein interacting motifs, multi-protein complex, application of protein interactions, databases and tools to study Protein interactome. Protein Networks in Plant signaling: Introduction to plant signaling, types of membrane receptors (Membrane receptors, intracellular and extracellular receptors, G-protein coupled receptors, ion channels, Pattern recognition receptors), components of cell signaling (secondary messengers, sensors and effectors, Two-component system, signal perception), Types of signaling pathways, reversible phosphorylation and dephosphorylation, role of plant signaling in development and immunity.</p>	<p>11 hours</p> <p>18 hours</p>

	3. Metabolomics: Overview of Metabolites, basics of metabolic pathways, errors of metabolism, sample preparation, extraction, derivatization, Targeted v/s untargeted metabolomics, Identification of molecular features and metabolites, structural confirmation, application of metabolomics in diagnosis.	7 hours
<u>Pedagogy:</u>	Lectures/Tutorials/Seminars/Assignment/Self study

<u>Learning outcome:</u>	Students will get familiar with principles and applications in Genomics, Transcriptomics, Proteomics and Metabolomics. They will be able to apply basic concepts in research work.	

Programme: M. Sc. (Botany)

Course Code: BOO- 501

Title of the Course: Fungal Chemistry and Mycoremediation.

Number of Credits: 1

Effective from AY: 2020-21

Prerequisites for the course:	Background of mycology, ecology and chemoinformatics.	
Objective:	Mycoremediation is one of the most complex areas in applied remediation engineering. Scientists began to use fungi and bacteria for the degradation of xenobiotic organic compounds toward the middle of the twentieth century. The use of bacteria showed fast and promising results, but research on evaluating fungi has lagged behind. This does not mean that fungi are not suitable organisms or that they function less satisfactorily than bacteria in degrading such compounds. The participation of fungi in bioremediation is now well established in all ecosystems. During the past two decades, many fungal scientists and engineers have wanted to try using fungi in the degradation of organic compounds, and for those who did try using them, good results were obtained. The discovery of the value of white-rot fungi in bioremediation has brought greater success and has thus stimulated research throughout the world. A new era in the use of fungal technologies for the degradation of organic compounds has begun. This credit course therefore envisages and aims to share the excitement in this new field.	
Content:	<p>1. Fungal Metabolites Derived from Amino Acids: Introduction, Penicillins, Cephalosporins, <i>b</i>-Lactams, Mycelianamide, Gliotoxin, The Cyclopenin-Viridicatin Group of Metabolites, Tryptophan-derived Metabolites, Glutamic Acid Derivatives, Fungal Peptides.</p> <p>2. Polyketides and Terpenoids from Fungi: Polyketide Biosynthesis, Triketides, Tetraketides, 6-Methylsalicylic Acid, Patulin and Penicillic Acid, Gladiolic Acid and its Relatives, Tetraketide Tropolones, Mycophenolic Acid, Pentaketides, Citrinin, Terrein, Hepta- and Octaketides: -Griseofulvin, Cladosporin (Asperentin); Polyketide Lactones, Statins, Cytochalasins, Fatty Acids from Fungi, Polyacetylenes from the Higher Fungi, Biosynthesis of Fungal Terpenoids, Monoterpenoids, Sesquiterpenoids, Diterpenoid Fungal Metabolites, Sesterterpenoids, Fungal Triterpenoids and Steroids,</p>	<p>1 hour</p> <p>1 hour</p>

	<p>Ergosterol, Fusidane Steroidal Antibiotics, Viridin, Wortmannin and their Relatives, Triterpenoids of the basidiomycetes, Meroterpenoids.</p> <p>3. Fungal Metabolites Derived from the Citric Acid Cycle: Introduction, Citric Acid and Related Acids, Fungal Tetroneic Acids, Canadensolide and Avenaciolide, Nonadrides, Squalenolides.</p> <p>4. Pigments and flavours from Fungi: Introduction, Polyketide Fungal Pigments, Fumigatin, Auroglaucon and Flavoglaucon, Hydroxyanthraquinone Pigments, Xanthone and Naphthopyrone Pigments, Extended and Dimeric Quinones, Fungal Pigments Derived from the Shikimate Pathway, Terphenyls, Pulvinic Acids, Some Pigments Containing Nitrogen, Fungal Carotenoids, Lichen Substances, flavours from fungi, Organoleptic Components of Mushrooms.</p> <p>5. Mycotoxins: Introduction, Ergotism, Trichothecenes as Mycotoxins, Other Fusarium Toxins, Aflatoxins, Mycotoxins of Penicillium Species, Poisonous Mushrooms.</p> <p>6. Fungal Biodegradation and Biodeterioration: Fungi as Environmental Indicators, Methods for Detection of Degradative Fungi, Mycoremediation: Fungal Bioremediation, White-Rot Fungi in Bioremediation, Ecology of Mycoremediation, Genetic Engineering of Mycoremediation.</p> <p>7. Fungal Treatment of Industrial Wastewaters, Distillery and Brewery Wastes.</p> <p>8. Fungal Metabolism of Petroleum Hydrocarbons, Phenols, Chlorophenols, Pentachlorophenol, Polycyclic Aromatic Hydrocarbons.</p> <p>9. Fungal Degradation of Polychlorinated Biphenyls and Dioxins, Pesticides.</p> <p>10. Fungal Lignin Degradation, Decolorization of Pulp and Paper Mill Effluents, Decolorization and Degradation of Dyes.</p> <p>11. Fungal Biosorption of Heavy Metals.</p>	<p>1 hour</p> <p>2 hours</p> <p>1 hour</p> <p>1 hour</p> <p>1 hour</p> <p>1 hour</p> <p>1 hour</p> <p>1 hour</p> <p>1 hour</p>

Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to work in industries using fungi for metabolite production or bioremediation. 2. Learn fungal chemical creativity and acquire skills in fungal bioprospecting. 3. Get suitable employment as fungal biochemist/Mycchemist. 	

Programme: M. Sc. (Botany)

Course Code: BOO- 502

Title of the Course: Lab in Fungal Chemistry and Mycoremediation.

Number of Credits: 1(24 hours)

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of basic mycology, instrumental techniques, basic microbiological and microscopic techniques	
--------------------------------------	--	--

Objective:	To impart knowledge on chemical creativity of fungi especially from industrial and environmental bioremediation angles	
Content:	<ol style="list-style-type: none"> 1. UV -Visible Spectroscopic analysis of any four fungal cultures. 2. Extraction of Melanin from Melanogenic cultures. 3. Extraction of organic acids from <i>Aspergillus niger</i> culture filtrate. 4. Microincineration technique for detecting calcium oxalate from fungi. 5. Use of Dragendorff reagent for Detection of fungal alkaloids. 6. Determination of sterols in yeast by LB method. 7. Detection of soluble beta glucans from yeasts using FTIR. 8. Extraction of fungal quinonoid pigments. 9. Bioassay for detection of antibiotic activity. 10. Total and differential count of fungi from soils, sediments <i>etc.</i> 11. Isolation of Fungi involved in biodeterioration of leather, paint films <i>etc.</i> 12. Isolation of fungi from cashew feni production waste. 13. Screening cultures for Bavendam's reaction on Tannic acid agar. 14. Detection of fungal lignocellulolytic hydrolytic enzymes <i>e.g.</i> Laccase, ligninase, cellulose. 15. Detection of other fungal hydrolytic enzymes amylases, proteases, urease. 16. Detection of fungal lipolytic enzymes -lipases, esterases <i>etc.</i> 17. Evaluation of Fungal growth in any six non polar organic solvents (any two cultures). 18. Fungal growth on polluting tar balls and polystyrene foam (any two cultures). 19. Fungal biodecolourization of common textile dyes (any two cultures, any one dye). 20. Using fungal biomass for biosorption of Iron (any two cultures). 21. Oxygen Bubble entrapment assay for fungal catalase (any two cultures). 	Each session of 2 hours, any 12 sessions
Pedagogy:	Field work, Lab exercises, Mini projects, Hands on exercises and demos, Assignments/Self-study/Moodle based guidance/Videos.

Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to work as fungal chemist or bioprospector. 2. Being able to work in companies using fungi as agents for bioremediation or secondary metabolite production. 3. Being able to establish industry based on fungal chemical products. 	

Programme: M. Sc. (Botany)

Course Code: BOO- 503

Title of the Course: Glycobiology

Number of Credits: 1

Effective from AY: 2020-21

Prerequisites for the course:	Good knowledge of chemistry, biology and biochemistry at UG level.	
Objective:	Glycobiology is one of the more rapidly growing fields in	

	<p>the natural sciences, with broad relevance to many areas of basic research, biomedicine, and biotechnology. The field includes the chemistry of carbohydrates, the enzymology of glycan formation and degradation, the recognition of glycans by specific proteins (lectins and glycosaminoglycan-binding proteins), glycan roles in complex biological systems, and their analysis or manipulation by a variety of techniques. Research in glycobiology thus requires a foundation not only in the nomenclature, biosynthesis, structure, chemical synthesis, and functions of glycans, but also in the general disciplines of molecular genetics, protein chemistry, cell biology, developmental biology, physiology, and medicine.</p>	
Content:	<p>1.General Principles: Historical Background and Overview, Saccharide Structure and Nomenclature, Exploring the Biological Roles of Glycans.</p> <p>2. Biosynthesis, Metabolism, and Function: Monosaccharide Metabolism, N-Glycans, O-Glycans, Glycosphingolipids, Glycophospholipid Anchors, Proteoglycans and Glycosaminoglycans, Sialic Acids, overview of Glycosyltransferases, Degradation and Turnover of Glycans, Bacterial Polysaccharides.</p> <p>3. Protein-Glycan interactions: Discovery and Classification of Animal, Plant and fungal Lectins, Selectins, Galectins, Microbial Carbohydrate-binding Proteins, Plant Lectins, their Classification, Structure, Uses and functions; Fungal lectins, their structural diversity, biological functions, molecular characterization.</p> <p>4. Methods and Applications: Principles of Structural Analysis and Sequencing of Glycans, Chemical and Enzymatic Synthesis of Glycans, Natural and Synthetic Inhibitors of Glycosylation, Glycobiology in Biotechnology and Medicine.</p> <p>5. Future perspectives: Glycogenes, glycoscience and rational drug design.</p>	<p>1 hour</p> <p>3 hours</p> <p>3 hours</p> <p>4 hours</p> <p>1 hour</p>
Pedagogy:	Lectures/Tutorials/Seminars/Videos/Moodle based guidance/Assignments/Self-Study

Learning Outcomes	<ol style="list-style-type: none"> 1. Be able to understand the role of glycans in biosphere and biotechnology. 2. Being able to understand role of glycans in health and disease and medicinal field. 3. Having Prospects to work in pathology and 	

	hematological laboratories.	
--	-----------------------------	--

Programme: M. Sc. (Botany)

Course Code: BOO- 504

Title of the Course: Lab in Glycobiology

Number of Credits: 1(24 hours sessions)

Effective from AY: 2020-21

Prerequisites for the course:	Basic knowledge of carbohydrate chemistry, biochemistry, cell biology, Spectroscopy	
Objective:	To impart training in various aspects of glycobiology.	
Content:	<ol style="list-style-type: none"> 1. Simple chemical tests to detect biological glycans. 2. Extraction of exocellular polysaccharides (EPS) from yeasts/fungi. 3. Quantitative Extraction of starch from plant storage organs. 4. Extraction of soluble lectins from any one plant and fungal source. 5. Study of plant gums/Acidic polysaccharides. 6. Haemagglutination reaction/assays with any one plant and fungal lectins. 7. Application of IR-spectroscopy for characterizing polysaccharides. 8. Immobilization and use of amylase. 9. Glycomics databases. 	4 hours 4 hours 4 hours 2 hours 2 hours 2 hours 2 hours 2 hours 2 hours
Pedagogy:	Practical exercises, mini projects, hands on demos, videos, moodle based guidance.	
References/Readings	<ol style="list-style-type: none"> 1. R R Townsend and A T Hotchkiss. 1997. Techniques in glycobiology, TF-CRC. 2. Thisbe K. Lindhorst. 2007. Essentials of Carbohydrate Chemistry and Biochemistry, Wiley. 3. Ginsburg V. and Robbins P. 1981. Biology of carbohydrates , vol. 1. Wiley, New York. 4. Fukuda M. 1992. Techniques in glycobiology. Marcel Dekker, New 	

	York.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Better understanding of practical techniques in glycbiology useful in analytical labs. 2. Better prospects for employment in pathology or hematology/blood/tissue typing labs or vaccine production units. 3. Better prospects of job in pharma industry. 	

Programme: M. Sc. (Botany)

Course Code: BOO- 505

Title of the Course: Fungal Biodiversity, Bioprospecting and Biotechnology

Number of Credits: 3

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of fungi and fungal biotechnology at UG Level.	
Objective:	To introduce students to interesting and exciting world of biodiversity of fungi in different ecosystems and habitats, their role in ecosystem functioning, their chemical creativity useful in biotechnology and economy based on industrially important strains.	
Content:	<ol style="list-style-type: none"> 1. Evolutionary biology and population genetics of fungi; fungal phylogeny; current status of fungal dimension of global biodiversity; inventory and monitoring methods; Fungi in global ATBI; fungi as friends and foes. <p>Characteristics of diverse fungal habitats; Fungi in terrestrial, marine and freshwater habitats; fungi in tropical ecosystems and extreme environments; Fungi in phyllosphere and phylloplane, Endophytic, rhizosphere and soil fungi; fungal endosymbionts; insect –fungus mutualism.</p> <p>Diseases of nurseries and forest trees; diseases of agro- and farm forestry; fungi as biodeteriorating agents in tropics; economic losses due to fungal decomposition; Soil-born pathogens; nematode-trappers; Fungal biodiversity of India. Case studies: fungal biodiversity of Western Ghats, Arabian Sea, Indian Ocean; fungi from alpine and polar regions.</p> <p>Present knowledge of research in fungal ecology; nutritional modes of fungi-saprotrophs, biotrophs and necrotrophs; role of fungi in ecosystem services.</p> <p>Fungi and global warming, conservation biology of fungal habitats and fungal resources.</p>	12 hours

	<p>2. Fungal bioprospecting:Chemically creative fungi; screening for industrially useful fungal metabolites; drugs and pharmaceuticals from fungi; Ecotaxonomic approach in chemical screening; primary and secondary products of metabolism; classification of secondary metabolites; primary and secondary screening of antibiotic producers; auxanography; enrichment culture, techniques for strain improvement and Strain development; Industrial fungal strainspreliminary and high throughput screening (HST); leads and lead optimization.</p> <p>3. Fungal biotechnology: Fungal biotechnological processes, Principles of fermenter design and operation, types of fermenters, formulation of fermentation medium, analysis of fermentation products.</p> <p>Biotechnological applications of yeast/fungi and their derivatives during history: bread making, alcohol production, applications in medical science, bioconversion and bio-ethanol.</p> <p>Production of antibiotics—beta lactam antibiotics- penicillins and cephalospoins, Organic acids- production of citric acid, fungal enzymes and their industrial applications- alpha amylases, cellulases, xylanases, invertase, proteases, Vitamins, pigments, PUFAs; therapeutc peptides.</p> <p>Production and utilization of fungal biomass; fungi as food and feed; Bakers and industrial yeast; production of alchoholic beverages-beer, wines; production of bread and cheese; Edible fungi; Mycoproteins. Advancement in mushroom cultivation technology; Commercial mushroom species; strain improvement and cultivation; tropical mushrooms and their cultivation; mushroom spawns; nutritional aspects of mushrooms.</p> <p>Fungal biofertilizers and biopesticides, myconematicides.</p> <p>Recombinant technology in yeast and fungi: composition of the different types of fungal vectors, selection markers, transformation strategies, yeast surface display, yeast two-hybrid.</p> <p>Heterologous gene expression/protein production: Description of the yeast secretion pathway, post-translational modifications (e.g. glycosylation), how to increase gene expression, examples, applications and future perspectives.</p>	<p>8 hours</p> <p>16 hours</p>

Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to grasp advanced concepts in fungal biotechnology, genomics and proteomics, 2. Being able to identify emerging areas of research and development in fungal bioprospecting and biotechnology, 3. Better capacity to assist in local fungal biodiversity registers and fungal aspects of ATBI, 4. Establish and manage accredited Fungus culture collections and contribute to local efforts of fungi habitat conservation. 	

Programme: M. Sc. (Botany)

Course Code: BOO-506

Title of the Course: Lab in Fungal Biodiversity, Bioprospecting and Biotechnology.

Number of Credits: 1 (24 hrs session)

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of fungi and fungal biotechnology at UG Level.	
Objective:	To introduce students to practical knowledge and hands on training in various areas of fungal biodiversity surveys, systematic chemical screening of important strains and impart technical knowledge in fungal bioprospecting and biotechnology to make them skilled in biotechnology based industries in general and those using fungi in particular	
Content:	<ol style="list-style-type: none">1. Using fungal databases e.g. indexfungorum.org2. Introduction to Fungal biodiversity inventorying methods.3. Constructing fungal phylogenetic tree.4. Production of fungal pellets in submerged culture.5. Studying Morphology of fungal pellets.6. Screening <i>Aspergillus</i> strains for organic acid production.7. Testing fungal cultures for Phosphate solubilization assay using Pikovskaya medium.8. Screening yeasts for sugar fermentation capacity.9. Extraction and UV-Visible spectral detection of pigments from fungi.10. Study of fungal melanins.11. Fungal enzyme assays using chromogenic methods.12. Producing and testing immobilized fungal biomass.13. Immobilization of fungal enzymes.14. Studying fermentation of grape juice with wine yeast.15. Production of mushroom spawn and assessment of its quality.16. Quality parameters of marketed mushrooms.17. Testing action of fungicides on fungal cultures.18. Testing Dough raising power of Bakers' yeast.19. Tests to detect fungal siderophores.20. Study of Nickel uptake by fungal cultures.	All two hour sessions, any 2 sessions of two hours each from 1-3, any 4 from 4 to 10, any 5 sessions from 11-18 and any 1 from 19 and 20
Pedagogy:	Practical exercises/ field and lab//demos/hands on exercises/ video tutorials/ software tools/mini projects/seminars/industrial study visits	
References/Readings	1. Satyanarayana T. and Johri B.N. (2005). Microbial	

	<p>diversity, Current Perspectives and Potential Applications, IK international.</p> <p>2. Gregory Michael Mueller, Gerald F. Bills and Mercedes S. Foster (2004). <u>Learning Outcomes</u>	<ul style="list-style-type: none"> • Enable the students to adopt necessary skills required for preparing fungal biodiversity inventories • Enable the students to get employment in biotechnology industries based on fungi • Students would be able to independently do high throughput screening of industrial strains of fungi 	

Programme: M. Sc. (Botany)

Course Code: BOO-507

Title of the Course: Mycological Techniques.

Number of Credits: 3

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of basic mycology/microbiology at UG level	
Objective:	Introduce students to important techniques in basic and applied mycology.	
Content:	<p>1. Fungi in field: Fungi in ATBI-protocols and work by Amy Rossman; Fungi in their natural habitats, Identification of tropical fungal habitats and nutritional modes in field (biotrophy, nectrotrophy, saprotrophy), techniques for various sample collection from terrestrial and aquatic habitats, sampling for extremophiles, field documentation, outdoor photography and videography of fungi in their natural</p>	12 hours

	<p>habitat;, sample processing in field and in laboratory; special samples-fungi in stratosphere, aeromycological techniques-indoor and outdoor environment, sampling fungal human pathogens, Collection and processing of environmental samples for fungal metagenomics.</p> <p>2. Mycotaxonomic techniques: Fungal systematics; identification techniques; taxonomy and classification; use of criteria for fungal identification, use of taxonomic keys for identification; Mycological Herbarium, fungal cytochemistry, action of different mountants and stains; preparing good stained and unstained preparations for microscopic studies, recording of taxonomically distinct characters, preparing taxonomic diagnosis; art and science of mycological drawings, photomicrography and fungal digital image analysis, specimen preparation for fluorescence, SEM and TEM, chemotaxonomic techniques; electronic keys and mycological databases, numerical and computer taxonomy; Chemo- and molecular taxonomy; molecular markers, fungal isozymes; the fungal holomorph; fungal gene banks; introduction to culture collections, culture databases, culture maintenance.</p> <p>3. Fungal cultural techniques: Various techniques for pure culture isolation and maximum recovery from different habitats; baiting, moist-chamber and particle-plating techniques, formulation of different media, purification and maintenance of cultures,; techniques for short term and long term maintenance of cultures; study of colony characters, growth, differentiation, cultural micromorphology and taxonomy; hyphal analysis; techniques for conidial ontogeny; use of fractal biology to study colony ontogeny; fungal cultural characters on solid and in liquid media; fungal morphotypes; microscopic and enzymological characterization, identification of interesting strains; special techniques for anamorphs and teleomorphs; production of protoplasts; growth in stationary and liquid culture; effect of pH, temp, light and humidity, study of submerged biomass (pellets) and culture filtrate; fungal photophysiology and chronobiology; screening for antibiotic production; basic techniques in fungal molecular biology (DNA, RNA, protein mini-prep), applications of PCR in mycology, mycoinformatics.</p>	<p>12 hours</p> <p>12 hours</p>

Learning Outcomes	<ol style="list-style-type: none"> 1. Being able to work in a mycological laboratory 2. Being able to work in a pharma industry using fermentation technology 3. Being able to work as fungal bioprospector 4. Being able to contribute in management of fungal culture collections. 	

Programme: M. Sc. (Botany)

Course Code: BOO-508

Title of the Course: Lab in Mycological Techniques.

Number of Credits: 1(Total 24 sessions)

Effective from AY: 2020-21

Prerequisites for the course:	Knowledge of basic mycology, microbiological and microscopic techniques, fungal taxonomy.	
Objective:	To impart training in modern mycological techniques appropriate to industrial and economic needs.	
Content:	<ol style="list-style-type: none"> 1. Collection of fungal samples from diverse habitats and recording of field data, 2. Preparation of mycological herbarium. 3. Examining fungal ramification of plant litter 4. Use of different stains and optical brighteners in mycology. 5. Photomicrography of interesting fungi, digital image analysis, 6. Taxonomic drawings of fungi using drawing tube. 7. Isolation of fungal cultures from diverse samples. 8. Use of fungal taxonomic keys and electronic databases, writing a taxonomic diagnosis. 9. Somatic pairing tests using pure cultures of higher fungi. 10. Evaluation of colony growth on solid media 11. Evaluation of colony growth in liquid media 12. Analysis of submerged biomass and culture filtrate from shaken cultures. 13. Hemocytometric counts of fungal spores. 14. Measurement of hyphal growth rate and Fractal dimensions of colonies 15. Use of micromanipulator for single spore isolation. 	Any 12 sessions, Each session of 2 hrs

	<p>16. Fungal protoplast production, fusion and regeneration using commercial lytic enzymes.</p> <p>17. Effect of light on growth of fungal cultures and pigment production.</p> <p>18. Antibiotic assays using fungal extracts.</p> <p>19. Studying cultural holomorphs (anamorph-teleomorph connection) in lab.</p> <p>20. Extraction of fungal DNA, RNA, Proteins.</p> <p>21. Introduction to fungal bioinformatics</p>	
Pedagogy:	Hands on exercises, miniprojects, field work, demos, videos, moodle based guidance, workshops

Programme: M.Sc. Marine Biotechnology

Course Code: MBC 181

Title of the Course: MARINE MICROBIOLOGY & ECOLOGY

Number of Credits: 3

Effective from: 2019-2020

Course Objectives	The objective of this course is to provide information about the microbes available in aquatic environment, their role and interaction with the marine environment	
Learning Outcomes	<ul style="list-style-type: none">• Explain principle features of marine ecosystems and the microbial diversity in oceans;• Describe and discuss marine microbes in terms of physiological capability and their biogeochemical role.	
Content	<p>MODULE I</p> <ul style="list-style-type: none">• Classification of the marine environment.• Marine microbial habitats, Estuarine Ecosystems: Rocky shores, Sand dunes, Salt marshes, Deep sea, hydrothermal vents, mangroves and coral reefs.• Diversity of Marine microorganisms: Archaea, Bacteria, Cyanobacteria, Algae, Fungi, viruses, viroids and prions.• Characteristics of marine microorganisms.• Specialized microorganisms: Extremophiles: barophiles, thermophiles, psychrophiles, , halophiles actinomycetes, polyextremophiles, anaerobes.• An overview of the organization and cell structure of prokaryotes and archaea:<ul style="list-style-type: none">i) cell wall ii) outer membrane iii) cytoplasmic membrane iv) flagella & specialized movements in microbes v) cell inclusions iv) differences among the groups. <p>MODULE II</p> <ul style="list-style-type: none">• Techniques in Marine microbiology:• Sampling: Water, Sediments.• Direct observation and enumeration of microbes: Light and electron microscopy to study morphology and structure of microbes.• Culture based methods for isolation and identification of microbes. Phenotypic and Genotypic testing, polyphasic methods of identification. Chemotaxonomy, Metagenomics.• Bergey's manual & identification of marine bacteria. <p>MODULE III</p>	<p>12 hours</p> <p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> ● Microbial nutrition: i) autotrophic & heterotrophic modes, ii) defining culture media to support growth, iii) selective and differential culture media. ● Bacterial growth kinetics: i) growth curve, the mathematical expression of growth & measurement of growth ii) synchronous growth iii) factors affecting growth iv) chemostat & turbidostat. ● Flagella and specialized moments in microbes, Chemotaxis, Phototaxis, Bioluminescence and indicator species and Biological Rhythms.

Programme: M.Sc. Marine Biotechnology
Course Code: MBC 182
Title of the course: CONCEPTS IN BIOCHEMISTRY
Number of Credits: 3
Effective from: 2019-2020

Course Objectives	The major objective of this course is to build upon the knowledge of basic biochemical principles with emphasis on different metabolic pathways and their integration. Attention is drawn to the structure-function relationships of biomolecules.	
Learning Outcomes	Gain fundamental knowledge in biochemistry and understand the role of enzymes in the regulation of metabolic pathways.	
Content	MODULE I <ul style="list-style-type: none"> • Biochemistry: the molecular logic of life. • Biochemical evolution: principles and mechanisms. • Buffering in biological systems; ionization and hydrophobicity • Amino acids; structure and functional group properties. • Peptides and covalent structure of proteins • Levels of structural organization, sequencing, 3-D structure and functional diversity of proteins, the concept of the proteome; the Ramachandran Plot; structure-function relationships in model proteins such as ribonuclease A, myoglobin and hemoglobin <p>Enzyme catalysis – general principles of catalysis; catalytic power and specificity quantitation of enzyme activity; Michaelis-Menten kinetics; relevance of enzymes in metabolic regulation</p>	12 hours
	MODULE II <ul style="list-style-type: none"> • Carbohydrates - structure and biological role. Sugars-mono, di, and polysaccharides with specific reference to glycogen, amylose and cellulose • Basic concepts and design of metabolism - glycolysis, gluconeogenesis, reciprocal regulations and non-carbohydrate sources of glucose • Citric acid cycle, entry to citric acid cycle, citric acid cycle as a source of biosynthetic precursors; • The pentose phosphate pathway • Bioenergetics – basic principles; equilibria and concept of free energy; coupled interconnecting reactions in metabolism; oxidation of carbon fuels • Thermodynamic quantities and laws, equilibria and concept of free energy, ATP as the main carrier of free energy in biochemical systems. 	12 hours
	MODULE III	12 hours

	<ul style="list-style-type: none"> • Lipids – Structure and properties of important members of storage and membrane lipids; lipoproteins • Fatty acid synthesis, β-oxidation; biosynthesis of membrane lipids and sterols with specific emphasis on cholesterol metabolism and the mevalonate pathway • Protein turnover and amino acid catabolism; nucleotide biosynthesis (<i>de novo</i> synthesis and salvage pathways) • General principles of intermediary metabolism and regulation of pathways. • Mitochondrial electron transport and its inhibitors • Oxidative phosphorylation; importance of electron transfer in oxidative phosphorylation; F_1-F_0 ATP Synthase; shuttles across mitochondria; regulation of oxidative phosphorylation. • Photosynthesis; the two photosystems; proton gradient across thylakoid membrane; the Calvin cycle. • Vitamins and hormones: chemistry and physiological role.

Programme : M.Sc. Marine Biotechnology
Course Code : MBC 183
Title of the course: MOLECULAR BIOLOGY
Number of Credits: 3
Effective from: 2019-2020

Course Objectives	The aim of this course is to obtain and understand fundamental knowledge of molecular and cellular processes such as RNA transcription, protein synthesis, mutation, epigenetic modification and gene regulation.	
Learning Outcomes	The students should be able to explain and summarize the scientific principles of the molecular biology of DNA, RNA and understand the role played in overall functioning of the cell.	
Content	<p>MODULE I</p> <ul style="list-style-type: none"> • Structure of DNA - A,B, Z and triplex DNA; • Organization of bacterial genome and eukaryotic chromosomes Heterochromatin and Euchromatin • DNA melting and buoyant density; T_m; DNA reassociation kinetics (Cot curve analysis) Repetitive and unique sequences; Satellite DNA; DNase I hypersensitive regions; DNA methylation & epigenetic effects. • Structure and function of prokaryotic and eukaryotic mRNA, tRNA (including initiator tRNA), rRNA and ribosomes. Processing of eukaryotic hnRNA: 5'-Cap formation; 3'-end processing of RNAs and polyadenylation; loop model of translation; Splicing of mRNA. • Gene transfer in bacteria-Conjugation, transformation and transduction. • DNA mutation and repair, Transposons <p>MODULE II</p> <ul style="list-style-type: none"> • Prokaryotic and eukaryotic transcription -RNA polymerase/s and sigma factors, • Transcription unit, Prokaryotic and eukaryotic promoters, Promoter recognition, Initiation, Elongation and Termination (intrinsic, Rho and Mfd dependent) • Gene regulation: Repressors, activators, positive and negative regulation, Constitutive and Inducible, small molecule regulators, operon concept: <i>lac</i>, <i>trp</i> operons, attenuation, anti-termination, stringent control, translational control. • Eukaryotic transcription - RNA polymerase I, II and III mediated, General eukaryotic transcription factors; TATA binding proteins (TBP) and TBP associated factors (TAF); assembly of pre-initiation complex for nuclear enzymes, interaction of transcription factors with the basal transcription machinery and with other regulatory proteins, mediator, TAFs. ; Silencers, insulators, enhancers, 	<p>12 hours</p> <p>12 hours</p>

	<p>mechanism of silencing and activation.</p> <p>MODULE III</p> <ul style="list-style-type: none"> • Translation in prokaryotes and eukaryotes, • Regulatory RNA and RNA interference mechanisms, miRNA, non-coding RNA • Families of DNA binding transcription factors: Helix-turn-helix, helix-loop-helix, homeodomain; 2C 2H zinc finger, multi cysteine zinc finger, basic DNA binding domains (leucine zipper, helix-loop-helix), nuclear receptors. • Interaction of regulatory transcription factors with DNA: properties and mechanism of activation and repression including Ligand-mediated transcription regulation by nuclear receptors. • DNA replication. • DNA recombination. 	12 hours

Course Code: MBC 184

Title of the course: BIOPHYSICAL PRINCIPLES & ANALYTICAL TECHNIQUES

Number of the Credits: 2

Effective from: 2019-2020

Course Objectives	The course is designed to provide a broad exposure to basic techniques used in Modern Biology research. The goal is to impart basic conceptual understanding of principles of these techniques and emphasize biochemical utility of the same. Student is expected to have a clear understanding of all analytical techniques such that the barrier to implement the same is abated to a great extent.	
Learning Outcomes	Students will learn to combine previously acquired knowledge of physics and chemistry to understand the biochemical processes in the cell.	
Content	<p>MODULE I</p> <p>Nucleic Acid, Protein-Polymer Description of Macromolecular Structure, Intermolecular and Intramolecular forces, Non Covalent Interaction; Hydrodynamic properties: Diffusion and sedimentation, determination of molecular weight from sedimentation and diffusion; Concept and application of Chemical and Physical equilibria in Biological system</p> <p>Physical biochemistry of cell: Chemical forces translation and rotation, diffusion, directed movements, biomolecules as machines, work, power and energy, thermal, chemical and mechanical switching of biomolecules, Responses to light and environmental cues; Biochemical and biophysical characterizations of the purified protein: Purified protein will be assayed for its biological activity, (Fluorescence from GFP), UV-VIS absorption and emission spectra resulting from intrinsic Tryptophan and GFP chromophores, Fluorescence quenching and polarization studies, Unfolding and refolding studies using CD and fluorescence methods, Fluorescence correlation spectroscopy experiment to measure the protein diffusion and hydrodynamic size, Atomic force microscopy of plasmid DNA.</p> <p>MODULE II</p> <p>Spectroscopic properties of proteins and nucleic acid: UV/Vis, Intrinsic fluorescence, Circular dichroism. Double Strand formation in nucleic acid, Ligand-protein binding, Protein denaturation and stability, Introduction of DSC and ITC; Protein folding kinetics and Biophysical methods, Misfolding and aggregation; Physical basis of conformation diseases; Introduction to basic principles of protein X-ray crystallography, protein NMR, Small Angle X-ray scattering</p>	<p>12 hours</p> <p>12 hours</p>

	(SAXS), Cryo-EM, Graphics and structural validation, Structural databases, Other biophysical and spectroscopic techniques to understand conformations of biomolecules; Mass Spectroscopy: Ionization techniques; mass analyzers/overview MS.

Effective from 2019-2020

Course Objectives	1) To provide a basic knowledge and to appreciate the components of the human immune response that work together to protect the host. 2) To understand the concept of immune-based diseases as either a deficiency of components or excess activity as hypersensitivity 3) To gain an insight into the mechanisms that lead to beneficial immune responses, immune disorders, and immune-deficiencies.	
Learning Outcomes	The mode of continuous assessment and formulation of tests enables students to handle competitive entrance exams. The basic overview of Immunology strengthens their foundations for a career in Biotechnology.	
Content	<p>MODULE I – Concepts and Basics</p> <ul style="list-style-type: none"> • Introduction – History and scope of immunology • Innate immunity:- factors, features, processes • Acquired:- the Specificity, memory, recognition of self from non-self. • Cells of the immune system: Hematopoiesis and differentiation, Lymphoid and Myeloid lineage, lymphocyte trafficking, B lymphocytes, T lymphocytes, macrophages, dendritic cells, natural killer and lymphokine-activated killer cells, eosinophils and mast cells, lymphocyte subpopulations and CD markers. • Organization of lymphoid organs • MALT, GALT, SALT • <p>MODULE II – Defence Components: Constituents of immune system and response</p> <ul style="list-style-type: none"> • Theories of antibody formation and resolution of antibody structure • Humoral immunity: cells, antibody formation, primary and secondary response. • Immunoglobulins – structure, distribution and function. • Antigen – Antibody interactions: forces, affinity, avidity, valency and kinetics. • Immuno-diagnostics..the basis • Nature and biology of antigens and superantigens: haptens, adjuvants, carriers, epitopes, T dependant and T independent antigens. • Antigen elimination <i>in vivo</i> <p>MODULE III – Defence Strategies and Pitfalls: Effector mechanisms of immune responses</p>	<div>12 hours</div> <div>12 hours</div> <div>12 hours</div>

	<ul style="list-style-type: none"> • Complement system: mode of activation, classical, alternate and MBL pathways. Structures of key components. • Cell mediated immune responses: cell activation, cell-cell interaction and cytokines. • Cell-mediated cytotoxicity: Mechanism of T cell and NK cell mediated lysis, antibody- dependant cell-mediated cytotoxicity, and lectin-mediated cytotoxicity. Phagocytosis: oxygen-dependant/ independent killing intracellularly. • Hybridoma technology and monoclonal antibodies. • Major histocompatibility complex...Structure of MHC molecules, basic organization of MHC in human , haplotype-restricted killing. • Hypersensitivity: An introduction to the different types. • Introduction to autoimmune diseases.

Programme: M.Sc. Marine Biotechnology
Course Code: MBC 187
Title of the course: CELL BIOLOGY
Number of Credits; 2
Effective from: 2019-2020

Course Objectives	The cells being “the fundamental building blocks of all organisms”, a comprehensive understanding of the cell and cellular function is essential for all biologists. This course will hence provide a conceptual overview of cellular system and functioning in animals and plants.	
Learning Outcomes	Understand major concepts in cell biology with an awareness of experimental approaches and how they are applied in cell biology research.	
Content	<p>MODULE I</p> <ul style="list-style-type: none"> • Biochemical organization of the cell; diversity of cell size and shape; cell theory, the emergence of modern Cell Biology. • Principles underlying microscopic techniques for study of cells : Light, Phase contrast and interference, Fluorescence, Confocal, Electron (TEM and SEM), Electron tunneling and Atomic Force Microscopy. Flow cytometry • Structure and diversity of biological membranes; mechanisms of membrane transport. Self-assembly of lipids, micelle, biomembrane organization - sidedness and function; membrane assembly. • Cell lysis and subcellular fractionation • Mitochondria and chloroplasts: ultrastructure and functional compartmentalization, biogenesis and organellar genome • Structure and function of microbodies, Golgi apparatus, Lysosomes and Endoplasmic Reticulum; • Nucleus – Structure and function of nuclear envelope, lamina and nucleolus; Macromolecular trafficking. • Cellular junctions and adhesions in animal cells; structure and functional significance of plasmodesmata. <p>MODULE II</p> <ul style="list-style-type: none"> • Organization and role of microtubules and microfilaments; Cell shape and motility; Actin-binding proteins and their significance; Muscle organization and function; Molecular motors; Intermediate filaments. • Protein localization – synthesis of secretory and membrane proteins, import into nucleus, mitochondria, chloroplast and peroxisomes, receptor- mediated endocytosis. • The plant cell wall; extracellular matrix in plants and animals • The eukaryotic cell cycle and its regulation • Molecular aspects of cell division • Cell signaling • Cell fusion techniques • Molecular chaperones: types, characteristics and functional significance • Proteosomes; structure and function 	<p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> • Differentiation of cancerous cells; role of growth factors, proto-oncogenes and signal transduction mechanisms in tumour formation • Oncogenes and tumour suppressor genes

Programme: M.Sc. Marine Biotechnology
Course Code: MBC 190:
Title of the course: AQUACULTURE TECHNOLOGY
Number of Credits: 3
Effective from 2019-2020

Course Objectives	This course is aimed to teach sustainable use of aquatic resources with various approaches in biotechnology.	
Learning Outcomes	<p>On completion of this course, students should be able to:</p> <ul style="list-style-type: none"> • Explain fundamental principles of aquaculture biotechnology; • Identify role of aquaculture biotechnology in society. 	
Content	<p>MODULE I</p> <p>Importance of coastal aquaculture; Aqua farms; Design and construction; Criteria for selecting cultivable species; Culture systems and management practices – extensive, semi intensive and intensive culture practices. Seed production in controlled condition; Types; Design and management of hatchery –induced spawning; Mass production of seeds; feed formulation; Artificial insemination - <i>in vitro</i> fertilization;</p> <p>Fish Feed Technology: Types of feed, conventional feed vs functional feeds; Principles of feed formulation and manufacturing, diets suitable for application in different aquaculture systems; feed formulation ingredients; Use of natural and synthetic carotenoids; feed additives; Role of additives; Feed processing: Gelatinization, extrusion Technology, pellet dressing with heat labile nutrients; Feed evaluation; Feeding schedule to different aquatic organisms, check tray operation and feed management, Biomass calculation based on feed intake; Post-harvest Biotechnology: Fundamental aspects of freezing, methods of freezing; Delaying of spoilage. Molecular Tools in Conservation of Fisheries Resources: Artificial Hybridization: Heterosis, Control of fish diseases by selection; selective breeding of disease resistant fish.</p> <p>Culture of Live food organisms: Candidate species of phytoplankton & zooplankton as live food organisms of freshwater & marine species; biology & culture requirements of live food organisms: green algae, diatoms, rotifers and brine shrimp.</p> <p>MODULE II</p> <p>Male and female of finfish and shellfish; Primary and secondary sex characters; Process of Oogenesis & Spermatogenesis, metabolic changes during gametogenesis; neuroendocrine system in crustacean & molluscs & its role in control of reproduction; mechanism of hormone synthesis, release, transport & action; Pheromones & reproductive behaviour; environmental factors influencing reproduction; Advances in Fish Breeding: Hypophysation, cryopreservation technique,</p>	<p>12 hours</p> <p>12 hours</p>

	<p>genetic basis of determination of sex; chromosome manipulation: ploidy induction, sex reversal; gynogenesis and androgenesis; Broodstock management; Application of cross breeding in aquaculture; Selective breeding: qualitative and quantitative traits for selection, methods of selection; Inbreeding and heterosis in various economic characters; hormone induced ovulation; Synthetic hormones for induced breeding- GnRH analogue structure and function.</p> <p>MODULE III</p> <p>Bio-floc technology; Aquaponics; Zero water exchange aquaculture system; Aqua mimicry; Hydroponics; Raceway system of aquaculture; Bioremediation in Aquaculture systems: Genetically modified organisms in waste water treatment; Bioremediation for soil and water quality improvement; Micro-algae- indoor and mass-culture methods, Biotechnological approaches for production of important microalgae and other commercial important products.</p>	12 hours

Programme :M.Sc. Marine Biotechnology
Course Code: MBC 281
Title of the course: BIOPROCESS TECHNOLOGY
Number of Credits: 3
Effective from : 2019-2020

Course Objectives	The objective of this course are to educate students about fundamental concepts of bioprocess technology and its related applications, thus, preparing them to meet challenges of new and emerging areas of biotechnology industry.	
Learning Outcomes	<p>On completing of this course, students should be able to:</p> <ul style="list-style-type: none"> • appreciate relevance of microorganisms from industrial context; • carry out stoichiometric calculations and specify models of their growth; • give an account of design and operations of various fermenters; • present unit operations together with fundamental principles for basic methods in production techniques for bio-based products; • calculate yield and production rates in biological production process, and also interpret data; • Give an account of important microbial/enzymatic industrial processes in the industry. 	
Content	<p>MODULE I Basic Principles of Biochemical Engineering and Fermentation Processes:</p> <ul style="list-style-type: none"> • Isolation, screening, and preservation of industrially important microbes • Bioreactor designs • Types of fermenters • Concepts of basic modes of fermentation: batch, fed-batch and continuous • Scale up fermentation processes • Media formulation • Air and media sterilization. • Aeration & agitation in bioprocess. • Measurement and control of bioprocess parameters. <p>MODULE II Industrial production of chemicals:</p> <ul style="list-style-type: none"> • Strain improvement for increased yield & other desirable characteristics • alcohol (beer) • organic acids (citric acid) • antibiotics (Penicillin) • amino acids (lysine) • Application of microbes in food processing: 	<p>12 hours</p> <p>12 hours</p>

	<p>manufacture of cheese and monosodium glutamate</p> <p>MODULE III Downstream Processing:</p> <ul style="list-style-type: none"> • introduction, removal of microbial cells & solids • bioseparation, filtration, centrifugation sedimentation. • flocculation, cell disruption, liquid-liquid extraction, • Purification by chromatographic techniques • Drying, crystallization. • Storage & Packaging • Effluent treatment & disposal. • Immobilization of microbial cells & their applications • Bioprocess for the production of biomass: yeast and mushrooms 	12 hours

Programme: M.sc. Marine Biotechnology

Course Code: MBC 282

Title of the course: POTENTIAL OF MARINE BIOTECHNOLOGY

Number of Credits: 2

Effective from 2019-2020

Course Objectives	The objective of this course is to impart knowledge of biotechnological applications of marine organisms, important processes and impacts on the marine ecosystems and ways to control them.	
Learning Outcomes	On completion of the course, students should be able to comprehend the uses of marine organisms, their significances, interactions, impacts and management technologies to come-up with solutions for their control.	
Content	<p>MODULE I Applications of Marine Organisms</p> <ul style="list-style-type: none">• Marine viruses and Bacteria• Giant bacteria and their significance• Unculturable bacteria : occurrence ,characteristics and exploitation• Barophilic organisms & their applications• Seaweeds for removal of metal pollutants• GFP, RFP characteristics and their applications• Green mussel adhesive protein• Chitosan : products and applications• Biomimetics <p>MODULE II Management</p> <ul style="list-style-type: none">• Marine pollution• Biofouling and corrosion• Ballast water• Red tides• Bacterial & viral pathogens in aquaculture• Aquaculture diseases in finfish and shellfish	<p>12 hours</p> <p>12 hours</p>

OPTIONAL COURSES

Programme: M.Sc. Marine Biotechnology

Course Code: MBO 183

Title of the course: LAB IV - BIOPROCESS TECHNOLOGY

Number of Credits: 2

Effective from 2019-2020

Course Objectives	The objectives of this laboratory course are to provide hands-on training to students in upstream and downstream unit operations.	
Learning Outcomes	<p>Students should:</p> <ul style="list-style-type: none"> • Gain ability to investigate, design and conduct experiments, analyze and interpret data, and apply laboratory skills to solve complete bioprocess technology problems. • Use acquired skills and knowledge in solving problems typical of bio-industry and research. 	
Contents	<ol style="list-style-type: none"> 1. Microbial production of ethanol using yeast sp. 2. Estimating ethanol concentration by Ceric Ammonium nitrate method. 3. Microbial production and estimation of organic acids: Citric acid using <i>Aspergillus</i> sp. 4. Microbial production of antibiotics. 5. Immobilization of microbial cells: use of alginate. 6. Fermentation: Batch, Fed-Batch and Continuous 7. Use of fermenter with special reference to scale-up operations. 8. Microfiltrations: separation of cells from broth 9. Bioseparations: Chromatography and extractions (organic acid & antibiotics) 10. Manufacture of ginger ale and estimating the alcohol content. 11. Solid State Fermentation: Mushroom cultivation. 12. Food Microbiology: Preparation of an edible fermented product 	48 hours

Programme: M.Sc. Marine Biotechnology
Course Code: MBO 184:
Title of the course: LAB VI - BIOINFORMATICS
Number of Credits: 1
Effective from: 2019-2020

Course Objectives	The aim is to provide practical training in bioinformatics and statistical methods including accessing major public sequence databases	
Learning Outcomes	<p>On completion of this course, students should be able to:</p> <ul style="list-style-type: none"> • describe contents and properties of important bioinformatics databases, perform text- and sequence-based searches, analyse and discuss results in the light of molecular biology knowledge; • explain major steps in pairwise and multiple sequence alignment, explain its principles and execute pairwise sequence alignment by dynamic programming; • predict secondary and tertiary structures of protein sequences; • Perform and analyse various statistical tools available to analyse the data. 	
Content	<p>MODULE I</p> <ol style="list-style-type: none"> 1. Using NCBI and Uniprot web resources. 2. Introduction and use of various genome databases. 3. Sequence information resource: Using NCBI, EMBL, Genbank, Entrez, Swissprot/ TrEMBL, UniProt. 4. Similarity searches using tools like BLAST and interpretation of results. 5. Multiple sequence alignment using ClustalW. 6. Phylogenetic analysis of protein and nucleotide sequences. 7. Use of gene prediction methods (GRAIL/Genscan,/Glimmer). 8. Use of various primer designing and restriction site prediction tools. 9. Use of different protein structure prediction databases (PDB, SCOP, CATH). 10. Construction and study of protein structures using RASMOL/Deepview/PyMol. 11. Homology modelling of proteins. 12. Use of tools for mutation and analysis of the energy minimization of protein structures. 	24 hours

Programme : M.Sc. Marine Biotechnology

Course Code: MBO 185 :

Title of the course : LAB VII - IMMUNOLOGY & MARINE PATHOGENESIS

Number of credits: 3

Effective from: 2019-2020

Course Objectives	This course involves learning techniques to identify reactions in the lab that form the basis for application in immunodiagnostics and also to gain an insight into the evaluation marine	
Learning Outcomes	Key hands-on experience of converting and applying theoretical knowledge to laboratory. Students become familiar with techniques involved in immunology as well as in the study of marine pathogens	
Contents	<ol style="list-style-type: none">1. Determination of antibody titer using double immunodiffusion2. Assessment of similarity between antigens using Ouchterlony's double diffusion test3. Estimation of antigen concentration using radial immunodiffusion4. Quantitative precipitation assay5. DOT ELISA6. Latex agglutination7. Immunoelectrophoresis8. Rocket immunoelectrophoresis9. Sampling of fish and shellfish for disease diagnosis10. Identification of bacteria- staining techniques and biochemical techniques11. Observation of cellular components of fish blood and shrimp hemolymph12. Isolation and characterization of fungi from fish & slide culture of fungi13. SDS-PAGE analysis of fish proteins14. Fish/shrimp cell culture.15. Identification of fish pathogens using various techniques.	72 hours

Programme: M.Sc. Marine Biotechnology
Course Code: MBO 187
Title of the course: IPR, BIOSAFETY AND BIOETHICS
Number of credits: 2
Effective from: 2019-2020

Course Objectives	<ul style="list-style-type: none"> To provide basic knowledge on intellectual property rights and their implications in biological research and product development; To become familiar with India's IPR Policy; To learn biosafety and risk assessment of products derived from biotechnology and regulation of such products; To become familiar with ethical issues in biological research. This course will focus on consequences of biomedical research technologies such as cloning of whole organisms, genetic modifications, DNA testing 	
Learning Outcomes	<p>On completion of this course, students should be able to:</p> <ul style="list-style-type: none"> understand the rationale for and against IPR and especially patents; understand why India has adopted an IPR Policy and be familiar with broad outline of patent regulations; understand different types of intellectual property rights in general and protection of products derived from biotechnology research and issues related to application and obtaining patents; gain knowledge of biosafety and risk assessment of products derived from recombinant DNA research and environmental release of genetically modified organisms, national and international regulations. 	
Contents	<p>MODULE I</p> <p>Introduction to intellectual property; types of IP: patents, trademarks, copyright & related rights, industrial design, traditional knowledge, geographical indications, protection of new GMOs; International framework for the protection of IP; IP as a factor in R&D; IPs of relevance to biotechnology and few case studies; introduction to history of GATT, WTO, WIPO and TRIPS; plant variety protection and farmers rights act; concept of 'prior art': invention in context of "prior art"; patent databases - country-wise patent searches (USPTO, EPO, India); analysis and report formation.</p> <p>Basics of patents: types of patents; Indian Patent Act 1970; recent amendments; WIPO Treaties; Budapest Treaty; Patent Cooperation Treaty (PCT) and implications; procedure for filing a PCT application; role of a Country Patent Office; filing of a patent application; precautions before patenting-disclosure/non-disclosure - patent application- forms and guidelines including those of National Bio-diversity Authority (NBA) and other regulatory bodies, fee structure, time frames; types of patent applications: provisional and complete specifications; PCT and conventional patent applications; international patenting- requirement, procedures and costs;</p>	12 hours

	<p>financial assistance for patenting-introduction to existing schemes; publication of patents-gazette of India, status in Europe and US; patent</p> <p>infringement- meaning, scope, litigation, case studies and examples; commercialization of patented innovations; licensing – outright sale, licensing, royalty; patenting by research students and scientists-university/organizational rules in India and abroad, collaborative research - backward and forward IP; benefit/credit sharing among parties/community, commercial (financial) and non-commercial incentives.</p> <p>MODULE II</p> <p>Biosafety and Biosecurity - introduction; historical background; introduction to biological safety cabinets; primary containment for biohazards; biosafety levels; GRAS organisms, biosafety levels of specific microorganisms; recommended biosafety levels for infectious agents and infected animals; definition of GMOs & LMOs; principles of safety assessment of transgenic plants – sequential steps in risk assessment; concepts of familiarity and substantial equivalence; risk – environmental risk assessment and food and feed safety assessment; problem formulation – protection goals, compilation of relevant information, risk characterization and development of analysis plan; risk assessment of transgenic crops vs cisgenic plants or products derived from RNAi, genome</p> <p>International regulations – Cartagena protocol, OECD consensus documents and Codex Alimentarius; Indian regulations – EPA act and rules, guidance documents, regulatory framework – RCGM, GEAC, IBSC and other regulatory bodies; Draft bill of Biotechnology Regulatory authority of India - containments – biosafety levels and category of rDNA experiments; field trials – biosafety research trials – standard operating procedures - guidelines of state governments; GM labeling – Food Safety and Standards Authority of India (FSSAI).</p> <p>Introduction, ethical conflicts in biological sciences - interference with nature, bioethics in health care - patient confidentiality, informed consent, euthanasia, artificial reproductive technologies, prenatal diagnosis, genetic screening, gene therapy, transplantation. Bioethics in research – cloning and stem cell research, Human and animal experimentation, animal rights/welfare, Agricultural biotechnology - Genetically engineered food, environmental risk, labeling and public opinion. Sharing benefits and protecting future generations - Protection of environment and biodiversity – biopiracy.</p>	12 hours

Programme: M.Sc. Marine Biotechnology
Course code: MBO 188:
Title of the course: BIOENTREPRENEURSHIP
Number of credits: 2
Effective from: 2019-2020

Course Objectives	<p>Research and business belong together and both are needed. In a rapidly developing life science industry, there is an urgent need for people who combine business knowledge with the understanding of science & technology. Bio-entrepreneurship, an interdisciplinary course, revolves around the central theme of how to manage and develop life science companies and projects. The objectives of this course are to teach students about concepts of entrepreneurship including identifying a winning business opportunity, gathering funding and launching a business, growing and nurturing the organization and harvesting the rewards.</p>	
Learning Outcomes	<p>Students should be able to gain entrepreneurial skills, understand the various operations involved in venture creation, identify scope for entrepreneurship in biosciences and utilize the schemes promoted through knowledge centres and various agencies. The knowledge pertaining to management should also help students to be able to build up a strong network within the industry.</p>	
Contents	<p>MODULE I Finance and Marketing</p> <ul style="list-style-type: none"> • Taking decision on starting a venture; Assessment of feasibility of a given venture/new venture; • Approach a bank for a loan; Sources of financial assistance; Making a business proposal/Plan for seeking loans from financial institution and Banks; Funds from bank for capital expenditure and for working; Statutory and legal requirements for starting a company/venture; Budget planning and cash flow management; Negotiations/Strategy With financiers, bankers etc.; With government/law enforcement authorities; With companies/Institutions for technology transfer • Assessment of market demand for potential product(s) of interest; Market conditions, segments; Prediction of market changes; Identifying needs of customers including gaps in the market, packaging the product; Market linkages, branding issues; Developing distribution channels; Pricing/Policies/Competition; Promotion/ Advertising; Services Marketing Dispute resolution skills. <p>MODULE II</p>	<p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> • Fundamentals of Entrepreneurship • Support mechanism for entrepreneurship in India Role of knowledge centre and R&D • Knowledge centres like universities and research institutions; Role of technology and upgradation; Assessment of scale of development of Technology; Managing Technology • Transfer; Regulations for transfer of foreign technologies; Technology transfer agencies. E-business setup, management. Human Resource Development (HRD) Leadership skills; • Managerial skills; Organization structure, pros & cons of different structures; Team building, teamwork; Appraisal; Rewards in small scale set up. External environment/changes; Crisis/ Avoiding/Managing; Broader vision–Global thinking.

Programme: M.Sc. Marine Biotechnology
Course code MBO 189
Title of the course: CELLULAR BIOPHYSICS
Number of credits: 3
Effective from: 2019-2020

Course Objectives	<p>The course will provide</p> <ol style="list-style-type: none"> 1) knowledge of the fundamental physical principles for the electrical properties of living cells and models describing membrane and action potentials. 2) an understanding of how potentials are generated across the membranes of cells and what these potentials do. 	
Learning Outcomes	It will equip the student with a broad perspective of integrating physics with biology at the cellular level with detailed information to pursue a career in newly evolving and dynamic fields of Neurobiology	
Contents	<p>MODULE I</p> <ol style="list-style-type: none"> 1) Overview of the Cellular organization of the nervous system: <ul style="list-style-type: none"> • Typical nerve cell • Types of cells: Neuronal, Glial cells, ependymal cells and Schwann cells. • Classification and types of neurons , cytons and axons • Function of nerve cells 2) Ion Channels <ul style="list-style-type: none"> • Sodium channels • Potassium channels • Calcium channels 3) Potentials of excitable cells <p>Biophysics of nerve cells:</p> <ul style="list-style-type: none"> • Electrical properties of the axon, ion fluxes, potentials of nerve cell membrane Resting membrane potential • Chemical –to- electrical transduction • Signal summation • Action Potential and propagation(a) Hodgkin and Huxley’s model, voltage clamp experiment and the derivation and propagation of Action Potential • Compound Action potential • Sodium and Potassium ionic currents • Nernst’s potential, Goldman’s equation, Sodium–potassium pump. • Transmission of nerve impulse <p>MODULE II</p>	<p>12 hours</p> <p>12 hours</p>

	<p>Communication between neurons:</p> <ul style="list-style-type: none"> • Types of synapses and synaptic transmission (electrical and chemical) • Synaptic transmission through second messenger (including mechanism of signal transduction, Neuromodulation and synaptic inhibition . • Electrical- to- chemical Transduction (a) Graded potential (b) Synaptic potential and synaptic integration [Electrical and Chemical Synaptic Potential, Excitatory Post Synaptic Potential (EPSP) Inhibitory Post Synaptic Potential (IPSP), Neuro- muscular junctions, Summation and facilitation. Spike potential • Neurotransmitter –physiological role, pharmacological significance, (example of one agonist and one antagonist for a neurotransmitter) Acetylcholine (Nicotinic and muscarinic receptors) <p>MODULE III</p> <ul style="list-style-type: none"> • Muscle- structure and electro-physiology of contraction. Spike potential Muscle contraction...Cross-bridge theory. Calcium channels. Repolarisation. • Visual system: Vertebrate eye and retina. • Morphology and arrangement of photoreceptors, Electrical response to light. Concept of receptive fields. Colour vision. • Organisation of the nervous system in Marine organisms: • Structure of nerve net, neural plexus, an ganglionated nervous system e.g. hydra, starfish, and <i>Aplysia</i> . • Type study in behavior of <i>Aplysia</i>: elementary behavior, neuroendocrine reflexes, complex behavior; higher grade and learned behavior. Synaptic plasticity. 	12 hours

Programme: M.Sc. Marine Biotechnology

Course code: MBO 193

Title of the course: LAB III - MOLECULAR BIOLOGY & GENETIC ENGINEERING

Number of credits: 3

Effective from: 2019-2020

Course Objectives	The objectives of this course are to provide students with the experimental knowledge of molecular biology and genetic engineering.	
Learning Outcomes	Students should be able to gain hands-on experience on gene cloning, protein expression and purification. This experience would enable them to begin a career in industry.	
Contents	<ol style="list-style-type: none">1. UV mutagenesis to isolate amino acid auxotroph.2. Transduction3. Phage titre with λ phage/M13.4. Genetic Transfer-Conjugation, gene mapping.5. Plasmid DNA isolation and DNA quantification.6. Restriction Enzyme digestion of plasmid DNA.7. Genomic DNA and RNA isolation8. Polymerase Chain reaction.9. Cloning of insert in to a plasmid vector10. Transformation of <i>E.coli</i> with standard plasmids, Calculation of transformation efficiency.11. Confirmation of the insert by Colony PCR and Restriction mapping12. Expression of recombinant protein, concept of soluble proteins and inclusion body formation in <i>E.coli</i>, SDS-PAGE analysis13. Purification of His-Tagged protein on Ni-NTA columns14. Southern hybridization.	72 hours

Programme: M.Sc. Marine Biotechnology

Course code: MBO 280

Title of the course: GENETIC ENGINEERING

Number of credits: 3

Effective from: 2019-2020

Course Objectives	To explain the various tools that are used in genetic engineering to create recombinants and its applications in biological research as well as in biotechnology industries	
Learning Outcomes	Given the impact of genetic engineering in modern society, students should be endowed with strong theoretical knowledge of this technology. In conjunction with the practicals in molecular biology & genetic engineering, the students should be able to take up biological research as well as placement in the relevant biotech industry.	
Content:	<p>MODULE I</p> <ul style="list-style-type: none">• Enzymes used in Molecular biology: restriction endonucleases and methylases; DNA ligase, Klenow enzyme, T4 DNA polymerase, polynucleotide kinase, alkaline phosphatase; nucleases, Topoisomerase, thermostable polymerase, Terminal deoxynucleotide polymerase and others.• cohesive and blunt end ligation; linkers; adaptors;• homopolymer tailing; labelling of DNA: nick translation,• Random priming, radioactive and non-radioactive probes,• Hybridization techniques: northern, southern, south-western and far-western and colony hybridization, fluorescence <i>in situ</i> hybridization.• Plasmids; Bacteriophages; M13mp vectors; pUC19 and pBluescript vectors, phagemids; Lambda vectors; Insertion and Replacement vectors; Cosmids; Artificial chromosome vectors (YACs; BACs); Principles for maximizing gene expression vectors; pMal; GST; pET-based vectors; Protein purification; His-tag; GST-tag; MBP-tag <i>etc.</i>; Intein-based vectors; Inclusion bodies; methodologies to reduce formation of inclusion bodies; mammalian expression and replicating vectors;• Baculovirus and <i>Pichia</i> vectors system,• Plant based vectors, Ti and Ri as vectors, yeast vectors, shuttle vectors. <p>MODULE II</p> <ul style="list-style-type: none">• Principles of PCR: primer design; fidelity of thermostable enzymes; DNA polymerases; types of PCR – multiplex, nested; real time PCR, touchdown PCR, hot start PCR, colony PCR, cloning of PCR products; T - vectors; proof reading enzymes;• PCR based site specific mutagenesis; PCR in molecular	<p>12 hours</p> <p>12 hours</p>

	<p>diagnostics; viral and bacterial detection;</p> <ul style="list-style-type: none"> • Sequencing methods; enzymatic DNA sequencing; chemical sequencing of DNA; automated DNA sequencing; RNA sequencing; chemical synthesis of oligonucleotides; mutation detection: SSCP, DGGE, RFLP. • Insertion of foreign DNA into host cells; transformation, electroporation, transfection; • construction of libraries; isolation of mRNA and total RNA; reverse transcriptase and cDNA synthesis; cDNA and genomic libraries; construction of microarrays – genomic arrays, cDNA arrays and oligo arrays; study of protein - DNA interactions: electrophoretic mobility shift assay; • DNase I footprinting; methyl interference assay, chromatin immunoprecipitation; protein-protein interactions using yeast two-hybrid system; phage display. <p>MODULE III</p> <ul style="list-style-type: none"> • Gene silencing techniques; introduction to siRNA; siRNA technology; Micro RNA; construction of siRNA vectors; principle and application of gene silencing; gene knockouts and gene therapy; • creation of transgenic plants; debate over GM crops; introduction to methods of genetic manipulation in different model systems <i>e.g.</i> fruit flies (<i>Drosophila</i>), worms (<i>C. elegans</i>), Frog (xenopus), fish (zebra fish) and chick; • Transgenics - gene replacement; gene targeting; creation of transgenic and knock-out mice; disease model; introduction to genome editing by CRISPR-CAS with specific emphasis on Chinese and American clinical trials; • Cloning genomic targets into CRISPR/Cas9 plasmids; electroporation of Cas9 plasmids into cells; purification of DNA from Cas9 treated cells and evaluation of Cas9 gene editing; <i>in vitro</i> synthesis of single guide RNA (sgRNA); using Cas9/sgRNA complexes to test for activity on DNA substrates; evaluate Cas9 activity by T7E1 assays and DNA sequence analysis; Applications of CRISPR/cas9 technology 	12 hours

Programme: M.Sc. Marine Biotechnology
Course code: MBO 284
Title of the course: MARINE FOOD TECHNOLOGY
Number of credits: 2
Effective from: 2019-2020

Course Objectives	The objectives of this course are to teach the principles of food preservation, processing and packaging and quality management practices for food of marine origin.	
Learning Outcomes	On completion of this course, students should be able to acquire practical knowledge of food technology for marine foods.	
Content	MODULE-I Preservation and processing – chilling methods, phenomena of rigor mortis, spoilage changes- causative factors; Drying – conventional methods; Salt curing, pickling and smoking; Freezing and cold storage, Canning procedures; Role of preservatives in processing. Packing – handling fresh fish, frozen packs, individually quick frozen (IQF), layered and shatter packs; Fishery by-products, cannery waste, feeds, silage, fish gelatin, fish glue, chitin and chitosan, pearl essence, fertilizer.	12 hours
	MODULE-II Seafood, microbiology, factors, influencing, microbial, growth and activity; Seafood, Borne pathogens, bacteria fungi, viruses; Spoilage, factors in seafood; Toxins influencing food spoilage; Microbes as food single cell protein (SCP), microbial neutraceuticals. Quality management – concepts, planning, system, quality control, quality assurance, quality improvement; Certification standards – ISO and HACCP; Principles of quality related to food sanitation, contamination, pest control, human resource and occupational hazards; Novel product development, marketing and sea food export – Marine Products Export Development Authority (MPEDA), marketing, government policies, export finance, economic importance; Novel products – nutrition promotion, consumer studies qualitative and quantitative research methods.	12 hours

Programme: M.Sc. Marine Biotechnology
Course code: MBO 286
Title of the course: DEVELOPMENTAL BIOLOGY
Number of credits: 2
Effective from: 2019-2020

Course Objectives	This course will provide a conceptual overview of how developmental patterns arise. Using examples from different model systems regulatory networks involved are highlighted, aiming to project the molecular basis of developmental patterns.	
Learning Outcomes	Understanding of major ideas in developmental biology; familiarization with experimental approaches and how they are applied to specific problems in developmental biology.	
Contents	<p>MODULE I</p> <ul style="list-style-type: none"> • Germ cells and fertilization; embryogenesis as modelled through <i>Xenopus</i>. • Cell fate & commitment – potency- concept of embryonic stem cells, differential gene expression, terminal differentiation, transdetermination. • Lying of body axis planes; cellular polarity: differentiation of germ layers. Morphogens, gradients, concept of compartmentalization and fate mapping. • Cellular movements and gastrulation (sea urchin as model system); mammalian development (mouse/rat model). • Neurulation. • Cell lineages and pattern formation- <i>Caenorhabditis</i> as a model system; concept of positional values; heterochronic genes and effects of their mutations. • Apoptosis : concept, mechanism and physiological significance. The role of programmed cell death in developmental processes. • Cell-cell communication in development; induction and competence; cascades of induction; paracrine factors. • Signal transduction cascades; Fibroblast growth factor and the RTK pathway; the Hedgehog family; the Wnt family; the TGF-β superfamily. • Juxtacrine signaling; the Notch pathway; cross-talk between pathways. Maintenance of the differentiated state. <p>MODULE II</p> <ul style="list-style-type: none"> • Organizational and functional hierarchy of developmental control genes; maternal and zygotic gene effects. • Homeotic selector genes in <i>Drosophila</i>; concept of the homeobox and homeotic mutations; conceptual 	<p>12 hours</p> <p>12 hours</p>

	<p>extrapolation to mammalian systems.</p> <ul style="list-style-type: none"> • Complications in mammalian development; extraembryonic structures; twins and embryonic stem cells; production of chimeric mice. • The unique development of the human brain; adult neural stem cells. • Post-embryonic development: metamorphosis, regeneration and aging; significance of Imaginal discs in <i>Drosophila</i>. • Embryogenesis and early pattern formation in plants; Plant Meristem Organization and Differentiation- Organization of Shoot Apical Meristem(SAM); Organization of Root Apical Meristem (RAM); Pollen germination and pollen tube guidance; Phloem differentiation; Self-incompatibility and its genetic control. • Role of nuclear–cytoplasmic interactions in development. <p>Medical implications of developmental biology.</p> <ul style="list-style-type: none"> • Overview of developmental mechanisms of evolutionary change.

Programme: M.Sc. Marine Biotechnology

Course code: MBO 288

Title of the course: ENZYMES: CHEMISTRY & APPLICATIONS

Number of credits: 3

Effective from: 2019-2020

Course Objectives	This course will provide a comprehensive view of enzyme chemistry and kinetics, methods and strategies for enzyme purification and characterization. One section also deals with the biotechnological significance of enzyme functions.	
Learning Outcomes	A thorough understanding of the essential concepts of enzymology, with an awareness of the biotechnological potential of enzymes in various fields of application.	
Content	<p>MODULE I</p> <ul style="list-style-type: none">• Classification and nomenclature of enzymes.• Effect of pH, temperature, ions, etc. on enzyme activity., the Arrhenius Plot• Enzyme extraction strategies; choice of systems for production of enzymes for biotechnological applications.• General methods for quantitative assay of enzymes.• Enzyme purification: principles and techniques of salting in and out, molecular• sieving, ion exchange and affinity chromatography, gel electrophoresis, isoelectric• focusing, 2-D electrophoresis.• Fold purification and enzyme recovery, setting up of a purification table. <p>MODULE II</p> <ul style="list-style-type: none">• Isozymes ;<i>in situ</i> localization of enzymes in gels.• Catalytic mechanisms: mechanism of action of lysozyme, chymotrypsin etc.• Cofactors and Coenzymes: physiological significance and contributions to enzyme activity measurements.• Reaction kinetics, order and molecularity; steady state kinetics; analysis of kinetic• data of single-substrate reactions.• Kinetics and mode of action of allosteric enzymes.• Enzyme inhibition: types and significance• Multisubstrate reactions and their kinetic parameters.• Enzyme activation.• Biological regulation of enzyme activity. <p>MODULE III</p> <ul style="list-style-type: none">• Role of covalent modification in enzymatic activity; zymogens.• Significance and applications of enzyme modifications through the use of PEG, etc.• Clinical and industrial applications of hydrolytic enzymes.	<p>12 hours</p> <p>12 hours</p> <p>12 hours</p>

Title of the course: MOLECULAR IMMUNOLOGY
Number of credits: 3
Effective from: 2019-2020

Course Objectives	The focus is on the key characteristics of immune system to recognize non-self from self...to remember structures and produce molecules that are highly specific to the foreign molecules. The course addresses in detail the different mechanisms that generate very large number of specific receptors that the immune system generates in response at the molecular level.	
Learning Outcomes	Will be theoretically equipped to develop strategies to manipulate the immune system, and its components to benefit the patient and design vaccines. It will prepare the students to engage further in this rapidly evolving field.	
Content	<p>MODULE I Recognition of antigens</p> <ol style="list-style-type: none"> The major histocompatibility complex: <ul style="list-style-type: none"> Discovery and its role in immune response Structure of MHC molecules Binding of peptides to MHC molecules Genomic organization of the MHC Recognition of antigens by T Lymphocytes <ul style="list-style-type: none"> Antigen processing and presentation to CD4⁺ and CD8⁺ T Lymphocytes. Antigen receptors and accessory molecules of T Lymphocytes Effector molecules of T lymphocytes <p>MODULE II Maturation, activation and regulation of Lymphocytes</p> <ol style="list-style-type: none"> Maturation of Lymphocytes <ul style="list-style-type: none"> General features of Lymphocyte maturation Formation of functional antigen receptor genes in B & T lymphocytes. Maturation of B lymphocytes. Maturation of T lymphocytes. P.O. Goa University, Taleigao Plateau, Goa 403 206, India

Syllabus of M.Sc. (Microbiology) Programme

The Programme is meant for students of B.Sc. (Microbiology) to pursue higher studies in Microbiology. It serves to impart advanced training to the students in the field of Microbiology with focus on microbial diversity, bioprospecting and applications of microbes for obtaining various biologically significant metabolites and in bioremediation of polluted environments. Students undergo hands-on training with state-of-the art technologies and are trained so as to develop an aptitude for independent research. The Programme equips students for higher research leading to the Ph.D. Degree in India or in International Universities overseas, or for employment in Research Institutes, in teaching, and in Industry.

Prerequisites: B. Sc. (Microbiology)

Course Structure of M.Sc. Microbiology

Under Optional Courses:

- The theory course is a prerequisite for any practical course.
- Students of Microbiology and Marine Microbiology Programmes shall be required to take both Theory and Practical Courses under a given Course Title.

Programme: M.Sc. (Microbiology)

Course Code: MIC 101

Title of the Course: MICROBIAL BIOCHEMISTRY

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	The student should be familiar with the different biomolecules and their metabolism.	
Objective:	This course deals with the characteristics, properties and biological significance of the biomolecules of life. In depth knowledge of the energetics and regulation of different metabolic processes in microorganisms.	
Content:		
1.	Biological Molecules	(12)
1.1	Proteins	
	Amino acids: features and properties.	
	Protein: structure, principles of separation and purification, molecular weight determination; sequencing and synthesis.	
	Enzymes: activity, inhibition, mechanism of action; regulatory – allosteric and covalently modulated enzymes and their significance in metabolism.	
1.2	Carbohydrates	
	Monosaccharides: types, characteristics and properties.	
	Disaccharides, oligosaccharides, polysaccharides – biological significance.	
1.3	Lipids	
	Fatty acids: saturated and unsaturated, structure and properties.	
	Lipids: biological significance; lipid composition of microorganisms.	
2.	Bioenergetics and Carbohydrate Metabolism	(12)
2.1	Bioenergetics	
	Thermodynamics, exergonic and endergonic reactions, redox potential, high energy compounds, ATP structure and significance.	
2.2	Oxidative Phosphorylation	
	Redox enzymes, aerobic electron transport and oxidative phosphorylation.	
2.3	Carbohydrate metabolism	
A.	Carbohydrates: Central pathways of metabolism – regulatory mechanisms, bioenergetics and significance – EMP, TCA cycle (glucose aerobic and anaerobic metabolism, malate metabolism), Glyoxylate cycle.	
B.	Gluconeogenesis from TCA intermediates / amino acids / acetyl-CoA; biosynthesis of polysaccharides and sugar interconversions.	

3.	Lipids, Amino Acids, Nucleotides and other Metabolic Paths	(12)
3.1	Lipid Metabolism	
A.	Anabolism: Biosynthesis of fatty acids: saturated and unsaturated, triglycerides, phospholipids,	
3.2	Amino Acid and Nucleotide Biosynthesis	
A.	Amino acid biosynthetic pathways and their regulation.	
B.	Purine and pyrimidine nucleotides, Deoxyribonucleotides: biosynthesis and regulation.	
C.	Biosynthesis of nucleotide coenzymes.	
3.3	Photosynthetic Metabolism	
A.	Organisms and photosynthetic pigments, fundamental processes in Photosynthesis.	
B.	Photosynthetic electron transport and photophosphorylation.	
3.4	Chemolithotrophy	
	Organisms, substrates, bioenergetics of metabolism.	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Lehninger, A., Cox, M. and Nelson, D. L., Principles of Biochemistry, W. H. Freeman & Company.	
	Moat, A. G., Foster, J. W. and Spector, M. P., Microbial Physiology, A. John Wiley & Sons Inc. Publication.	
	Bull, A. T. and Meadow, P., Companion to Microbiology, Longman Group Limited, New York.	
	Voet, D., Voet, J. G. and Pratt, C. W., Principles of Biochemistry, John Wiley and Sons Inc.	
	Murray, R. K., Bender, D. A., Botham, K. M., Kennelly, P. J., Rodwell, V. W. and Weil, P. A., Harper's Illustrated Biochemistry, The McGraw-Hill Companies, Inc.	
	Plummer, D. T., An Introduction to Practical Biochemistry, Tata McGraw Hill Publishing Company.	
	Sadasivam, S., Manickam, A., Biochemical Methods, New Age International (P) Limited.	
	Jayaraman, J., Laboratory Manual in Biochemistry, John Wiley & Sons, Limited, Australia.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Apply the knowledge to understand the microbial physiology and to identify the microorganisms. 2. Understand the regulation of the biochemical pathway and possible process modifications for improved control over microorganisms for microbial product synthesis. 	

Programme: M.Sc. (Microbiology)

Course Code: MIC 102

Title of the Course: MICROBIAL GENETICS

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students have basic knowledge of Mendelian genetics, structure of DNA and RNA, Prokaryotic and eukaryotic genome organisation, mutation concept, basic knowledge about replication, transcription and translation.	
Objective:	This course develops concept of Classical Mendelian genetics and deviation from Mendelian principles, Microbial genome organization (Prokaryotic and Eukaryotic), Viral Genetics, Mutagenesis, Bacterial plasmids as research tools, transcription and translation in prokaryotes and eukaryotes and application of Microbial Genetics.	
Content:		
1.		
1.1	Classical Mendelian genetics and deviation from Mendelian principles: Origin of mitochondria and plastids – Endosymbiont theory, DNA in Mitochondria and plastids, Mitochondrial and plastid genes inherited by Non-Mendelian mechanism.	(03)
1.2	Microbial genome organization: 3 Domains of Life based on 16S rRNA and 18S rRNA; Prokaryotic and Eukaryotic; replication, transcription and regulation. Structure of Prokaryotic genes (lac and trp operon) and Eukaryotic Genes (interrupted Genes), Prokaryotic & Eukaryotic genome. Microbial gene transfer (Conjugation, transformation, transduction). Structural chromosomal aberrations and their significance: Deletion, duplication, inversion, translocation. Aneuploidy and polyploidy.	(05)
1.3	Viral Genetics : Genomic organization and Replication of viruses:- T4, Lambda Phage and its strategies - Lytic and Lysogenic cycles, TMV, SV40, Hepatitis B, HIV. Retroviruses and retroposons - introduction and genetic significance. Viroids and plant diseases, virusoids.	(04)
2.		
2.1	Genomic (DNA) Rearrangements: Mechanism of General and programmed DNA rearrangements, Antigenic and phase variation in bacteria. Transposons: IS elements – Composite transposons (Tn3, Tn10), Ty, Copia and P type, Mechanism of transposition. Role of transposons in DNA rearrangements and microbial genome evolution.	(04)

2.2	<p>Mutagenesis, mutation and mutants: Somatic and germinal mutation, spontaneous and induced mutations, site specific using PCR/ cassette mutagenesis, and random mutagenesis.</p> <p>DNA Damage: Thymine dimer, apyrimidinic site and apurinic site, cross linking, deamination of base, base mismatch.</p> <p>Types of mutation: silent mutation, missense mutation, nonsense mutation, Read through mutation, frameshift- insertion and deletion mutation, translocation, Inversion, suppressor mutation.</p> <p>Mutagenic chemicals and radiations and their mechanism of action: Base analogues (5-Bromouracil and 2-amino purines), EMS, acridines, NTG, Hydroxylamine; mutagenic radiations- UV, X-rays and gamma rays. Ames test; Auxotrophy.</p>	(08)
3.		
3.1	<p>Fungal Genetics: Yeast - <i>Saccharomyces cerevisiae</i>/ <i>S. pombe</i> and <i>Neurospora</i> genomes as model genetic systems; Chromosome replication, yeast artificial chromosomes, tetrad analysis, genetic compatibility and non-compatibility genes, heterokaryosis, Parasexuality, Petite mutants of yeast, Killer yeast.</p>	(06)
3.2	<p>Bacterial plasmids: Types of plasmids, F plasmids and their use in genetic analysis-F⁺/Hfr cells/ F'cells, colicin and col plasmids, R plasmids, metal resistance, and antibiotic resistance - efflux pump/MDR bacteria, Ti plasmid, 2μ plasmid. Replication in plasmids. Bacterial plasmids as research tools. Integrons and Genomic islands - pathogenicity islands.</p>	(06)
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Gardner, E. J., Simmons, M. J. and Snustad, D. P., Principles of Genetics, John Wiley & Sons.

	Green, M. R. and Sambrook, J., Molecular Cloning: A laboratory manual, Cold Spring Harbour Laboratory Press, New York.	
Learning Outcomes	<ol style="list-style-type: none"> 1) Explains principles/concept of Prokaryotic and Eukaryotic genetics, Viral Genetics and application in research. 2) Mutagenesis, Mutation and mutants and their significance in microbial evolution. 3) Application of bacterial and eukaryotic plasmids in research. 	

Programme: M.Sc. (Microbiology)

Course Code: MIC 103

Title of the Course: MICROBIAL TAXONOMY AND SYSTEMATICS

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students should have a basic understanding of binomial nomenclature, the basis of classification systems and be familiar with the distinguishing features of different groups of microorganisms.	
Objective:	This course introduces the development of taxonomy and systematics, the various characters used for this purpose, the rules governing the different taxonomy and classification systems and the salient features of the different microbial groups. It also focuses on the rapidly evolving nature of taxonomy and systematics.	
Content:		
1.		
1.1	Microbial taxonomy and systematics Concepts of taxonomy (characterization, classification and nomenclature) and systematics; classification of microorganisms, three domain, six-kingdom, 8-kingdom systems.	(02)
1.2	Phenotypic characters - Morphology, Biochemical tests (e.g. API, BIOLOG), Bacteriophage typing, Serotyping.	(04)
1.3	Chemotaxonomic markers - Cell wall components, lipid composition, cellular fatty acid (FAME analysis), isoprenoid quinones, protein profiles (e.g. MALDI-TOF).	(06)
1.4	Nucleic acid based techniques – Terminal Restriction Fragment Length Polymorphism (TRFLP); G+C content (T_m and HPLC); pyrosequencing; 16S rRNA gene sequencing; phylogenetic analysis; DNA-DNA hybridization.	(08)
1.5	Concepts of species, numerical taxonomy and polyphasic taxonomy.	(04)
2.	Salient features of phylum, class and orders with representative examples of the following – Archaea, Eubacteria (bacteria, cyanobacteria, actinomycetes), Mycota, Protista (algae, protozoa, diatoms); and viruses.	(12)
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/Readings	Sneath, A. H. P., Mair, S. N. and Sharpe, E. M., Bergey's Manual of Systematic Bacteriology Vol. 2. Williams & Wilkins Bacteriology Symposium, Series No 2, Academic Press, London/New York.

	Norris, J. R. and Ribbons, D. W., Methods in Microbiology, Vol. 18 & 19, Academic Press.	
	Reddy, C. A., Methods for General and Molecular Microbiology, ASM Press.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Apply knowledge of the standard rules of classification systems to categorize microorganisms. 2. Appreciate and explain the dynamic and ever developing nature of the field of microbial taxonomy and systematics. 	

Programme: M.Sc. (Microbiology)

Course Code: MIC 104

Title of the Course: BIOSTATISTICS

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Basic ability to handle numbers and calculation.	
Objective:	The paper develops concepts about types of data observed in biological experiments, its handling and processing. It develops concepts of hypothesis and formulation of experiments. It gives understanding of various statistical operations needed to carryout and process the biological data.	
Content:		
1.		
1.1	Characteristics of biological data: Variables and constants, discrete and continuous variables, relationship and prediction, variables in biology (measurement, ranked, attributes), derived variables (ratio, index, rates), types of measurements of biological data (interval scale, ratio scale, ordinal scale, nominal scale, discrete and continuous data). Elementary theory of errors: exact and approximate numbers, source and classification of errors, decimal notation and rounding off numbers, absolute and relative errors, valid significant digits, relationship between number of valid digit and error, the error of sum, difference, product, quotient, power and root, rules of calculating digits.	(03) (04)
1.2	Data handling: Population and samples, random samples, parameter and statistics, accuracy and precision, accuracy in observations, Tabulation and frequency distribution, relative frequency distribution, cumulative frequency distribution. Graphical representation: types of graphs, preparation and their applications.	(05)
2.		
2.1	Measures of central tendency: characteristics of ideal measure, Arithmetic mean – simple, weighted, combined, and corrected mean, limitations of arithmetic mean; Median – calculation for raw data, for grouped data, for continuous series, limitations of median; Mode – computation of mode for individual series, by grouping method, in a continuous frequency distribution, limitations of modes; Relationship between mean, median and mode; mid-range.	(03)
2.2	Measure of dispersion: variability, Range, mean deviation, coefficient of mean deviation, standard deviation (individual observations, grouped data, continuous series), variance, coefficient of variance, limitation. Skewness – definition, positive, negative, purpose, measure, relative	(04)

	measure, Karl Pearson's Coefficient, Bowley's Coefficient, Kelly's Measure, Moments.	
2.3	Correlation analysis – Correlation, covariance, correlation coefficient for ungrouped and grouped data, Pearson's Rank Correlation coefficient, scatter and dot diagram (graphical method). Regression analysis - Linear and exponential function - examples: DNSA conversion by reducing sugar, survival/growth of bacteria, regression coefficients, properties, standard error of estimates, prediction, regression analysis for linear equation.	(05)
3.		
3.1	Probability: Probability, Combinatorial Techniques, Elementary Genetics, Binomial, Poisson, Normal Distributions.	(04)
3.2	Hypothesis Testing – parameter and statistics, sampling theory, sampling and non-sampling error, estimation theory, confidence limits, testing of hypothesis, test of significance; Students' T-test, t-distribution, computation, paired t-test.	(04)
3.3	Chi-square test, F-test and ANOVA.	(04)
Pedagogy:	Lectures/tutorials/assignments/self-study/MOODLE/Videos	
References/Readings	Kothari, C. R., Quantitative Techniques, Vikas Publishing House.	
	Arora, P. N. and Malhan, P. K., Biostatistics, Himalaya Publishing House.	
	Danilina, N.I., Computational Mathematics, Mir Publishers.	
	Surya, R. K., Biostatistics, Himalaya Publishing House.	
Learning outcomes	Able to collect, handle, process and present the Biological Data. Apply the principles of statistics on biological experiments.	

Programme: M.Sc. (Microbiology)

Course Code: MIC 105

Title of the Course: Practical I

Number of Credits: 4

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students have theoretical knowledge about various biomolecules; the different groups of microorganisms; ability to perform calculations	
Objective:	This course provides opportunities for hands-on experience with microbiological and biochemical concepts in laboratory setup along with handling and processing of such data for statistical analysis.	
Content:		
I	Microbial Biochemistry	(24)
1.	Standard curve for sugar.	
2.	Standard curve for protein.	
3.	Enzyme assay.	
4.	Precipitation of protein from solution by salting out.	
5.	Dialysis.	
6.	Specific activity, fold purification, percentage yield of enzyme.	
7.	Molecular weight determination by SDS-PAGE.	
II	Microbial Genetics	(24)
1.	Isolation of plasmid DNA from bacterial cells by Alkaline Lysis method (Birnboim and Doly, 1979).	
2.	Agarose gel electrophoresis, visualization and documentation of plasmid and genomic DNA using Gel Doc system.	
3.	Spectrophotometric quantification and purity of bacterial plasmid DNA.	
4.	UV mutagenesis and screening of pigment deficient mutants of <i>Serratia marcescens</i> .	
III	Microbial Taxonomy and Systematics	(24)
1.	Morphological, physiological and biochemical characterization of bacteria.	
2.	Chemotaxonomic analysis of cell wall.	
3.	Characterization of actinomycetes (<i>Streptomyces</i> sp.).	
4.	Characterization of yeast (<i>Saccharomyces cerevisiae</i> , <i>Schizosaccharomyces pombe</i>).	
5.	Characterization of cyanobacteria.	

IV	Biostatistics	(24)
1.	Excel spreadsheet and data analysis.	
2.	Linear equation analysis (regression analysis).	
3.	Normal distribution.	
4.	Hypothesis testing.	
Pedagogy:	Experiments in the laboratory, data collection and processing.	
References/ Readings	As given under respective Theory Courses MIC 101-T to MIC 104-T	
Learning Outcomes	<ol style="list-style-type: none"> 1. Skillful handling and estimating biomolecules and other metabolic products of microorganisms 2. Learning Plasmid DNA isolation using Alkaline lysis method and agarose gel electrophoresis for application in microbial research. 3. Application of techniques to isolate and characterize different groups of microorganisms. 4. Ability to collect data, processing and statistical interpretation of microbiology-related experiments. 	

Programme: M.Sc. (Microbiology)

Course Code: MIC 201

Title of the Course: TECHNIQUES AND INSTRUMENTATION IN MICROBIOLOGY

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	The student should be familiar with the concepts in basic chemistry and should be able to use basic instruments in Microbiology.	
Objective:	This course develops the concepts of methodology involved in studying the different components of microbial cell and various techniques and instruments involved in product analysis.	
Content:		
1.		(12)
1.1	Chromatographic techniques:	
	GC, HPLC, detectors, column/s matrix- Ion-exchange, affinity and molecular exclusion. (using examples for separation of microbial lipids, pigments, nucleic acids and proteins/enzymes).	
1.2	Centrifugation:	
	Principles, methodology, application; Density gradient centrifugation; Ultracentrifugation (Separation of ribosomal subunits of bacteria).	
1.3	Spectrophotometry:	
	Atomic Absorption Spectrophotometry (AAS), UV-Visible, fluorimetry, Fourier transformation infra-red spectroscopy (FTIR), NMR, MS.	
2.		(12)
2.1	Microscopy:	
	Epifluorescence filter technique (DEFT), SEM, TEM, Confocal microscopy.	
2.2	Radio-isotope and tracer techniques:	
	Isotope and types of isotopes, Radio-activity counters, Autoradiography,	
2.3	Cell and tissue culture techniques:	
	Primary and secondary/established cell lines, Monolayer and suspension cultures, Fluorescence activated cell sorting (FACS), Biohazards and Biosafety cabinet.	
3.		(12)
3.1	Electrophoretic technique:	
	PAGE, IEF, , PFGE, DGGE, TGGE, Single stranded conformation polymorphism (SSCP), Electroporator, Micro-array technique.	
3.2	Isolation of cell organelles:	
	Different methods of cell lysis/ breakage and isolation and purification of various cell organelles - Cell surface structures, cell envelopes, plasma membranes, peptidoglycan, Outer membrane, ribosomes, protoplasts, spheroplast.	

3.3	Others:	
	X-ray diffraction.	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Wilson, K. and Walker, J., Principles and Techniques of Biochemistry and Molecular Biology, Cambridge University Press, N.Y., USA.	
	Cooper, T. G., The Tools of Biochemistry, Wiley India Pvt. Ltd.

	Norris, J. R. and Ribbons, D. W., Methods in Microbiology, Volume 5, Part B, Academic Press.	
	Colowick, S. P. and Kaplan, N. O., Methods in Enzymology, Vol. VI, Academic Press, N.Y.	
	Parakhia, M. V., Tomar, R. S., Patel, S. and Golakiya, B. A., Molecular Biology and Biotechnology: Microbial Methods, New India, Pitampura.	
	Sambrook, J., Fritsch, E. F. and Maniatis, T., Molecular Cloning: A Laboratory Manual, Cold Spring Harbor Laboratory Press, USA.	
	Jayaraman, J., Laboratory Manual in Biochemistry, John Wiley & Sons Limited, Australia.	
Learning Outcomes	Ability to use techniques and instruments involved in the study of microorganisms and their products.	

Programme: M.Sc. (Microbiology)

Course Code: MIC 202

Title of the Course: INDUSTRIAL MICROBIOLOGY

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Basic knowledge about the types of microbes and their products of industrial relevance. Knowledge of microbial biochemistry, physiology, genetics and statistics.	
Objective:	Development of concepts in the processes, instruments, management, quality, etc. being used in the industries to produce the products using microorganisms.	
Content:		
1.		
1.1	History of Industrial Microbiology, fermentation processes, descriptive layout and components of fermentation process for extracellular and intracellular microbial products.	(05)
1.2	Microbial growth kinetics: Batch kinetics – Monod's model (single substrate), deviations from Monod's model, dual substrates – sequential utilization, multiple substrates – simultaneous utilization, substrate inhibition, product synthesis (primary and secondary metabolite), toxic inhibition, death constant.	(05)
1.3	Microbial growth kinetics: Fed-batch kinetics – fixed volume, variable volume and cyclic fed-batch, applications and examples of fed-batch systems. Continuous cultivation system – relationship between specific growth rate (μ) and dilution rate, comparison between various cultivation systems.	(04)
2.		
2.1	Bioreactor design and operation: classification of reactors; Ideal mixed v/s plug flow reactor; designing parameters for reactors (stirred tank reactor, airlift reactor, plug flow reactor), rheology of fermentation broth.	(05)
2.3	Bioreactor design and operation: gas-liquid mass transfer, heat transfer, analysis of dimension less parameters and their application (aeration number, power number and Reynold's number; Scale-up of bioprocesses: parameters used in scale-up and problems associated with scale-up.	(05)
3.		
3.1	Solid substrate fermentation (SSF): Principles and application; Surface fermentation Comparison between SSF, Surface fermentation and SmF. Immobilized enzymes and cell systems.	(03)

3.2	Fermentation monitor and control: Common measurement and control systems (speed, temperature, gas, pH, Dissolved oxygen, foam, redox, air flow, weight, pressure, biomass), On-line and off-line analysis.	(04)
3.3	Industrial scale Down-stream processing and product recovery: principle and general description of instrumentation, Recovery of particulates (cells and solid particles), recovery of intracellular products, primary isolation (extraction, sorption), precipitation, industrial processes for chromatography and fixed bed adsorption, membrane separations; Type Processes - Antibiotic (Penicillin including semi-synthetic).	(05)
Pedagogy:	Lectures/tutorials/assignments/self-study/Moodle/Videos	
References/Readings	<ol style="list-style-type: none"> 1. Demain, A. L., Davies, J. E. and Atlas, R. M. Manual of Industrial Microbiology and Biotechnology, ASM Press. 2. Vogel, H. C. and Tadaro, C. W., The Encyclopedia of Bioprocess Technology: Fermentation, Biocatalysis and Bioseparation, Volumes 1 - 5, John Wiley Publisher. 5. Stanbury, P. F., Whitaker, A. and Hall, S.J., Principles of Fermentation Technology, Butterworth-Heinemann Publishers. 	
Learning Outcomes	<ol style="list-style-type: none"> 1. Apply the principle of management and controls on the microbial processes in industrial settings. 2. Apply the principles of physiological understanding in improvement of the industrial processes. 	

Programme: M.Sc. (Microbiology)

Course Code: MIC 203

Title of the Course: MOLECULAR BIOLOGY

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that the students have a basic knowledge of DNA (structure and replication), transcription and protein synthesis	
Objective:	This course develops concepts in molecular biology: DNA packaging, DNA damage and repair, gene structure, expression and regulation in both prokaryotes and eukaryotes	
Content:		
1.	Genetic material, bonds, types of DNAs, DNA packaging and model organisms	(12)
1.1	Nucleic Acids, bonds, types of DNAs, DNA packaging and model organisms	
A.	Structure of DNA and RNA.	
B.	Bondings and different types of DNA (B-DNA & Z-DNA).	
C.	DNA packaging in bacteria (Nucleoid) and viruses.	
D.	Yeast as a minimal model eukaryote.	
1.2	Chromosomes, Genomes and it's evolution	
A.	Fundamental functions of DNA.	
B.	Chromosomal DNA and its packaging in the chromatin fibre.	
C.	Chromatin structure, structural features (Telomere, Centromere and Repetitive sequences) of chromosomes and their functions.	
D.	Gene duplication and mutations.	
E.	DNA Gels: Agarose gel electrophoresis, RNA denaturing gels, Ethidium Bromide, SYBER GOLD SYBER GREEN II, DNA and RNA ladders, Tracking dyes Methylene blue, Xylene cynol	
2.	DNA Damage, DNA Repair and Recombination	(12)
2.1	DNA damage elements/factors	
A.	Types of DNA damage (spontaneous and induced DNA damage).	
B.	Mechanisms/pathways to remove damaged DNA: Excision repair, mismatch repair, recombination repair in <i>E. coli</i> and SOS Repair.	
C.	Role of <i>RecA</i> in DNA damage repair, Photoreactivation repair in <i>E. coli</i> involving photolyase.	
2.2	Mechanisms of Genetic Recombination	
A.	General and site specific recombination.	
B.	Heteroduplex DNA formation (Homologous recombination).	
C.	Synaptonemal Complex, Bacterial RecBCD system and its stimulation of chi sequences.	
D.	Role of <i>RecA</i> protein, homologous recombination, Holliday junctions.	

3.	How cells read the Genome	(12)
3.1	From DNA to Proteins	
A.	From DNA to RNA.	
B.	From RNA to Protein.	
C.	The RNA world and origin of life.	
3.2	Gene structure and control of gene expression in Prokaryotes and Eukaryotes	
A.	An overview of Gene expression control, DNA binding motifs in gene regulatory proteins, genetic switches and their role in control of gene expression.	
B.	Post-transcriptional controls-transcriptional attenuation, Riboswitches, Alternate splicing, RNA editing, RNA Interference.	
C.	Translation of mRNA in Prokaryotes and Eukaryotes.	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/Readings	Alberts, B., Johnson, A., Lewis, J., Morgan, D., Raff, M., Roberts, K. and Walter, P., Molecular Biology of the Cell, Garland Science.

	Davis, L. G., Dibner, M. D. and Battey, J. F., Basic Methods in Molecular Biology, Elsevier.	
	Gerhardt, P., Methods for General and Molecular Bacteriology, Elsevier.	
Learning Outcomes	Understanding of gene structure, expression and regulation of gene expression in both prokaryotes and eukaryotes for application in molecular research.	

Programme: M.Sc. (Microbiology)

Course Code: MIC 204

Title of the Course: MYCOLOGY

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	The student should be familiar with the structural morphology of the fungus and their existence in the surrounding environment.	
Objective:	This course deals with detailed classification and identification of fungi, fungal ecology in terrestrial, aquatic and extreme habitats, fungal genetics and applications of fungal enzymes and various primary and secondary metabolites.	
Content:		
1.	Fungal diversity and distribution	(12)
1.1	Origin and phylogeny; classification	
1.2	Fungi – Terrestrial and Aquatic	
A.	Terrestrial, Fresh water and Marine: Coastal – mangrove; Estuarine; Ocean	
B.	Hypersaline waters – Thalassohaline and Athallasohaline: Solar salterns, Salt Lake, Dead Sea.	
1.3	Extremophilic Fungi	
	Oligotrophs, Alkaliphiles, Acidophiles, Barophiles, Psychrophiles, Thermophiles, Halophiles, Osmophiles, Xerophiles.	
	Adaptation to extreme environments.	
2.	Physiology and Genetics	(12)
2.1	Physiology of fungi	
A.	Growth and development.	
B.	Fungal hormones- attractants, morphogenesis and differentiation.	
C.	Microbial interactions.	
D.	Secondary metabolites: antimicrobials, mycotoxin, pigments.	
2.2	Fungal genetics	
	<i>Neurospora</i> and <i>Saccharomyces</i> : Life-cycle; Tetrad analysis, gene conversion; Deuteromycotina: parasexuality, cytoplasmic inheritance; Electrophoretic karyotyping.	
2.3	Identification of fungi	
A.	Colonial and morphological characteristics.	
B.	Molecular finger printing.	
3.	Pathogenesis - Antifungal Therapy	(04)
3.1	Pathogenesis	
A.	Mycoses - Systemic, sub-cutaneous, cutaneous and superficial,	
B.	opportunistic	

	Plant pathogens.	
3.2	Antifungal Therapy	
	Drugs acting on cell membrane, protein synthesis inhibitors; fungicides.	
4.	Applications	(08)
A.	Industrially important enzymes.	
B.	Bioprospecting of secondary metabolites: Antimicrobials, antitumour agents, nutraceuticals, pigments,.	
C.	Biodegradation and bioremediation.	
D.	Biocontrol.	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Alexopoulos, C. J., Mims, C. W. and Blackwell, M., Introductory Mycology, John Wiley & Sons (Asia) Pvt. Ltd.	
	Mehrotra, R. S. and Aneja, K. R., An Introduction to Mycology, Wiley Eastern Limited.	
	Cooke, R. C. and Whipps, J. M., Ecophysiology of fungi, Blackwell Scientific Publications, Oxford.	
	Deacon, J. W., Introduction to Modern Mycology, Volume 7 of Basic Microbiology, Blackwell Scientific Publications.	
	Kendrick, B., The Fifth Kingdom, Focus Publishers.	
	Davis, B. D., Dulbecco, R., Eisen, H. N. and Ginsberg, H. S., Microbiology, Harper and Row.	
	Strickberger, M. W., Genetic, The MacMillan Company, New York.	
	Domsch, K. H., Gams, W. and Anderson, T-H., Compendium of Soil Fungi, IHW-Verlag.	
	Gilman, J. C. and Joseph, C., A Manual of Soil Fungi, Daya Books.	
	Onions, A. H. S., Allsop, D. and Eggins, M. O. W., Smith's Introduction to Industrial Mycology, Edward Arnold, London.	
Learning Outcomes	Apply the knowledge in fungal taxonomy, bioremediation and bioprospecting of secondary metabolites and industrially important fungal enzymes.	

Programme: M.Sc. (Microbiology)

Course Code: MIC 205

Title of the Course: Practical II

Number of Credits: 4

Effective from Academic Year: 2018-19

Prerequisites	Knowledge of basic microbiology techniques	
Objective:	This course develops the skills for techniques and instrumentation in microbiology, industrial microbiology, molecular biology, and mycology	
Content:		
I	Techniques and Instrumentation in Microbiology	(24)
1.	Microscopy – compound, phase contrast – of bacterial cells.	
2.	Density gradient separation of microbial cells.	
3.	Cell disruption of pigmented bacteria/yeast by sonicator, efficacy of sonication and pigment profiling using UV-visible spectrophotometer.	
4.	Polyacrylamide gel electrophoresis (PAGE), Zymogram.	
5.	Molecular exclusion chromatography.	
II	Industrial Microbiology	(24)
1.	Fermentation kinetics – growth of <i>E.coli/S.cerevisiae</i> and determination of μ_{max} , K_s , $Y_{x/s}$, m.	
2.	Rheology of substrate solutions.	
3.	Designing of fermentor – stirred tank reactor.	
4.	Baker's yeast – FSSAI/ISI quality assurance – Counts of Yeast, Fungi, Bacteria, Spore, Coliforms, <i>E.coli</i> , <i>Salmonella</i> , <i>Shigella</i> , <i>Vibrio</i> ; Dough raising capacity; Fermentation power; Moisture content; Ash content.	
III	Molecular Biology	(24)
1.	Isolation of genomic DNA of bacterial cells, estimation of quantity and purity of DNA by spectrophotometry, and agarose gel electrophoresis.	
2.	PCR amplification of a specific gene using genomic DNA as a template and agarose gel analysis of PCR product to determine amplicon size.	
IV	Mycology	(24)
1.	Study and Identification of fungi	
1.1	Study of standard cultures:	
A.	Colony characteristics	
B.	Morphological characteristics	
1.2	Isolation and identification of fungi.	
A.	Observation of colonial and morphological characteristics	

B.	Reference to identification keys	
2.	Application of fungi for bioremediation Fungal degradation of a plant polymer.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under respective Theory Courses MIC 201-T to MIC 204-T	
Learning Outcomes	<ol style="list-style-type: none"> 1. Able to handle the instruments for carrying out microbiological research work or in the industries. 2. To learn techniques involved in genomic DNA isolation and PCR amplification for use in molecular research. 3. Handling fungal cultures and exploring them for better and newer prospects. 4. Apply principles of industrial microbiology for development and assessment of process and products. 	

Programme: M.Sc. (Microbiology)

Course Code: MIO 101

Title of the Course: MEDICAL VIROLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	The student should have basic understanding of viruses.	
Objective:	This course develops concepts in structure, classification, cultivation, assay and pathogenesis of disease-causing viruses.	
Content:		
1.	Virus: Structure, Cultivation and Assay	(12)
1.1	Viruses	
A.	Introduction.	
B.	Visualization by electron microscopy.	
C.	Structure: envelope, capsid, nucleic acid.	
D.	Defective viruses.	
E.	Classification.	
1.2	Viral genome	
	Genomic diversity - DNA or RNA, segmented or non-segmented.	
1.3	Cultivation and assay of viruses	
A.	Cultivation - <i>in vitro</i> using cell cultures: primary, secondary cultures, cell lines. - <i>in ovo</i> using chick/duck egg embryo. - <i>in vivo</i> using experimental animals	
B.	Viral multiplication and interference.	
C.	Assay by physical methods and by infectivity and cultivation methods Detection by plaque, pock, polykaryocytes, haemadsorption, immunofluorescence, cytopathogenicity, tumor formation.	
2.	Viral Diseases	(12)
2.1	Viral agents of disease: structure, mode of replication and pathogenesis Picornavirus: Enteroviruses (polio) and rhinoviruses (upper respiratory tract); Herpes group: Herpes simplex, Herpes zoster, Cytomegalovirus, Epstein Barr virus. Hepatitis (A, B, C, D, E); HIV; Orthomyxoviruses: Influenza. Paramyxoviruses: Mumps and Measles; Arboviruses: Togavirus - Rubella; Rhabdovirus: Rabies; Corona Virus: SARS. Emerging viral agents of disease.	
2.2	Oncogenic viruses DNA viruses: Papova and Adeno viruses, Herpes EBV and HCV. Retrovirus.	

3.	Antiviral Combat	(12)
3.1	Virus-Host interactions. Host specific and nonspecific defense mechanisms; neutralizing antibodies; interferon.	
3.2	Viral vaccine development and viral chemotherapy. Traditional vaccine preparations and newer methods - molecular approach	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/Readings	Davis, B. D., Dulbecco, R., Eisen, H. N. and Ginsberg, H. S., Microbiology, Harper and Row Publishers.	
	Microbiology and Immunology - Online, Department of Pathology, Microbiology and Immunology, University of South Carolina School of Medicine.	
	White, D. O., Fenner, F., Medical Virology, Gulf Professional Publishing.	
	Cohen, A., Medical Virology, John Wiley & Sons, Incorporated.	
	Evans, B., Perspectives in Medical Virology, Volume 1, Elsevier.	
	De La Maza, L. M., Peterson, E. M., Springer Science & Business Media.	
Learning Outcomes	Explain morphology, mode of infection, multiplication of medically important viruses and their treatment.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 102

Title of the Course: ARCHAEA [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Basic knowledge of 3 domains of life, difference between prokaryotic cells, eukaryotic cells and archaea.	
Objective:	This course develops concept of Three domains of Life, Ecology, physiology and diversity of Archaea, cell structure and architecture of archaea, metabolism and energetics of archaea and Genetics of domain Archaea.	
Content:		
1.		(12)
1.1	Significance of Archaea: Biotechnology, Biogeochemical cycling, Evolutionary developments.	
1.2	Ecology, physiology and diversity of Archaea Global econiches: Deep Sea, Hydrothermal vent, Dead Sea, solar salterns, geothermal vents, solfataras, Antarctica, soda lake. Study of archaeal biodiversity; unculturable archaea by metagenomics. Archaeal culture retrieval methods, novel samplers. Preservation and maintainance of archaeal cultures. Nutrition, growth and growth kinetics and physiological versatility, Stress response of Methanogens (<i>Methanobacterium thermoautotrophicum</i>); Halophiles (<i>H. salinarum</i>); Thermophiles (<i>Thermoplasma acidophilum</i>); Thermoacidophiles (<i>Sulfolobus acidocaldarius</i>); Psychrophilic archaea (<i>Methanogenium frigidum</i> , <i>Methanococcoides burtonii</i>); Methanotrophs.	
1.3	Cell structure and architecture of Archaea: Cellular organization: cell morphotypes, cell envelopes -archaeal membrane lipids and cell wall, appendages -pili, flagella, cannulae, hami. Novel bio-molecules: Glycerol diether moieties and macrocyclic lipid, novel enzymes, co-enzymes: methanopterin, formaldehyde activation factor, Component B, Coenzyme M, F420, F430, corrinoids.	
2.	Metabolism and energetics of Archaea	(12)
2.1	Modified anabolic pathways of carbohydrates and lipids; methanogenesis and acetoclastic reactions.	
2.2	Modified central metabolic pathways: EMP, ED, incomplete TCA; reverse Kreb cycle, carbon dioxide reduction pathways: reductive acetyl-CoA pathway, 3-hydroxypropionate pathway. Chemolithoautotrophy.	

2.3	Bioenergetics: ATP synthesis (i) respiration-driven (ii) light-driven, involving bacteriorhodopsin (iii) chloride-driven, involving halorhodopsin	
3.	Genome of Archaea	(12)
3.1	Size of genome, G + C content, associated proteins, archaeal histones and nucleosomes, introns in archaea, archaeal RNA polymerases, reverse DNA gyrase.	
3.2	Plasmids, transposons -IS elements. Modifications in tRNA and rRNA structure. Novel 7S rRNA. DNA replication, translation and transcription in archaea.	
3.3	Gene organization in Archaea: (i) <i>his</i> operon (ii) <i>bob</i> operon (iii) <i>mcr</i> operon.	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Woese, C. R., Fox, G. E., (1977) Phylogenetic structure of the prokaryotic domain: the primary kingdoms. Proc Natl Acad Sci USA. 74: 5088–5090.

	Rothe, O. and Thomm, M., (2000) A simplified method for the cultivation of extreme anaerobic archaea based on the use of sodium sulfite as reducing agent, Extremophiles. 4: 247-252.	
Learning Outcomes	1) Explains concept of third domain of Life Archaea. 2) Explains Ecology, Physiology and Biochemistry of domain Archaea. 3) Principles of Archaeal Genetics and application. 4) Application of Archaea and archaeal bioactive compounds in Industry.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 103

Title of the Course: ARCHAEA [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students have basic knowledge of 3 domains of life and basic microbiology techniques.	
Objective:	This course develops concepts in sampling and isolation of archaea from different niches. Also identification of archaea and study of archaeal pigments.	
Content:		(24)
1.	Isolation and culturing of archaea.	
2.	Identification of isolate:	
2.1	Biochemical tests for archaea.	
2.2	Extraction of archaeal pigment and characterization using UV-Vis spectroscopy.	
3.	Screening for hydrolytic enzymes.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 102-T	
Learning Outcomes	1)Sampling from different Niches of Archaea 2)Skill development for Isolation, culturing of Archaea and identification of archaea. 3) Bioprospecting of bioactive molecules from archaea.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 104

Title of the Course: MARINE MICROBIOLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Basic understanding of the unique properties of water, features of marine environments and microorganisms.	
Objective:	This course focuses on the various characteristics of marine environments including the physico-chemical variables, climate events, microbial habitats, the different marine microorganisms found in seawater and their metabolic diversity, detection and enumeration methods.	
Content:		
1.		(12)
1.1	Introduction to oceanography: the world's oceans and seas, properties of seawater, physico-chemical factors in the marine environment such as temperature, density, nutrients, salinity, dissolved gases, waves, tides, oceanic currents, Ekman transport and upwelling; oceanic phenomena such as Coriolis effect, eddies, gyres, El Nino Southern Oscillation (ENSO).	
1.2	Marine microbial habitats: estuaries, mangroves, salt marshes, beach, coastal ecosystems and coral reefs.	
2.	Marine microbes – bacteria, fungi, phytoplankton, zooplankton, viruses: their growth, physiology and contribution to ocean processes	(12)
2.1	Modes of microbial growth: viable but non-culturable (VBNC) microorganisms, biofilms, microbial mats, epibiosis.	
2.2	Physiology of marine microbes: metabolic diversity, microbial loop; marine snow; fermentation, aerobic respiration, anaerobic respiration (denitrification, sulphate reduction, methanogenesis); nitrification, annamox, sulphur oxidation, methanotrophy; carbon dioxide fixation in autotrophs; the role of microorganisms in biogeochemical cycling: carbon, nitrogen, phosphorous, sulphur, iron.	
3.	Methods in marine microbiology	(12)
3.1	Sampling equipment: water samplers such as Niskin sampler, Hydro-Bios sampler, Rosette samplers; sediment samplers such as van Veen grabs and corers.	
3.2	Analysis of primary productivity: the radiocarbon method	
3.3	Analysis of bacterial productivity: the thymidine uptake method	
3.4	Measurement of respiration rates: light-dark bottle method	
3.5	Tools to study marine microbial diversity: flow cytometry, molecular approaches such as metagenomics and community fingerprinting.	

Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Belkin, S. and Colwell, R. R., Ocean & Health: Pathogens in the Marine Environment, Springer.	
	Grasshoff, K., Ehrhardt, M. and Kremling, K., Methods of Seawater Analysis, Verlag Chem., Weinheim.

	Sournia, A., UNESCO Monographs on Oceanographic Methodology, Vol. 6, Phytoplankton Manual, UNESCO Publishing, Paris.	
	Tomas, C. R., Identifying Marine Phytoplankton, Academic Press, San Diego, CA.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Explain the concept of marine environments and the factors governing them. 2. Apply the principles of marine microbiology to understand the biological phenomena occurring in marine environments. 	

Programme: M.Sc. (Microbiology)

Course Code: MIO 105

Title of the Course: MARINE MICROBIOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students should have a basic understanding of the unique physico-chemical characteristics of seawater and the different microbial groups in marine environments.	
Objective:	This Course focuses on techniques involved in analysis of various parameters of seawater and enzyme and biofilm studies from marine bacterial isolates.	
Content:		(24)
1.	Analysis of physico-chemical parameters of seawater.	
2.	Isolation and enumeration of microbes from coastal environments.	
3.	Assessment of salt requirement of marine isolates from different ecosystems.	
4.	Denitrification by marine bacterial isolates.	
5.	Study of biofilm formation by microorganisms.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 103-T	
Learning Outcomes	1. Skillful estimation of physico-chemical parameters of seawater. 2. Expertise in handling and characterizing marine bacterial isolates.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 106

Title of the Course: ENVIRONMENTAL MICROBIOLOGY AND BIOREMEDIATION [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that the students have a basic knowledge of ecosystem structure and biogeochemical cycles (water, O,C,N,S,P)	
Objective:	This course develops concepts in Environmental Microbiology (microbial diversity, community structure and role of microorganisms in biogeochemical cycles, role of microorganisms in sustainable development and bioremediation of pollutants using microorganisms.	
Content:		
1.	Microbial Ecology	(12)
	Microbial community structure, evolution of communities Types of Ecosystems: components and functioning of ecosystem, concept of homeostasis, biotic and abiotic components in the environment and their interaction, characteristics and functions. Energy flow and material cycling. Food webs. Ecological succession. Ecological efficiency. Concepts of microcosms and ecotones.	
	The expanse of microbial diversity, estimates of total number of species, measures and indices of diversity.	
2.	Biogeochemical processes	(07)
	Biogeochemical cycling of carbon, nitrogen, phosphorous, sulphur, Fe and Mn: physiological and biochemical aspects	
3.	Concepts of sustainable and holistic development	(05)
	Role of microorganisms in environment, Use of microorganisms towards sustainable development and specific pollution abatement programmes, need for environment impact assessment studies.	
4.	Microbes on surface	(05)
	Nature and significance, activity in surface films Biofilm kinetics and its application to waste water treatment	
5.	Microbiological bioremediation	(07)
	Bioremediation technologies. Overview of aerobic / anaerobic biodegradation and biotransformation of aliphatic, aromatic, xenobiotic and recalcitrant hydrocarbons. Methods of environmental monitoring and pollution control using nanotechnology.	
Pedagogy:	Lectures/tutorials/assignments/self-study	

References/ Readings	Scragg, A. H., Environmental Biotechnology, Longman Publishers.	
	Sharma, P. D., Environmental Microbiology, Alpha Science International.	
	Osborn, A. M. and Smith, C. J., Molecular Microbial Ecology, Taylor and Francis.	
	Liu, W-T. and Jansson, J. K., Environmental Molecular Microbiology, Caister Academic Press.	
	Norris, J. R. and Ribbons, D.W., Methods in Microbiology, Vol. 18 & 19, Academic Press	
	Murugesan, A. G. and Rajakumari, C., Environmental Science and Biotechnology: Theory and Techniques, MUP Publishers.	
Learning Outcomes	Understanding the significance of microorganisms in biogeochemical cycling of nutrients, sustainable development and bioremediation of pollutants for developing strategies of environmental conservation and remediation.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 107

**Title of the Course: ENVIRONMENTAL MICROBIOLOGY AND
BIOREMEDIATION [P]**

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that the students have a basic knowledge of the environmental parameters for water analysis.	
Objective:	This course develops techniques in water analysis and biodegradation of aromatic pollutants.	
Content:		(24)
1	Analysis of water samples - Physico-chemical: pH, temperature, COD, BOD, and microbiological	
2	Studies on microbial adherence: BATH assay.	
3	Study of biodegradation of aromatic compounds using ortho / meta mode of ring cleavage	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 104-T	
Learning Outcomes	Learning techniques for water analysis and biodegradation of aromatic pollutants.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 108

Title of the Course: GENETIC ENGINEERING (T)

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Knowledge of bacterial and animal genetics, basic molecular and microbiology is a prerequisite.	
Objective:	This course aims to introduce the fundamental tools and techniques required for molecular cloning, with emphasis on DNA editing to protein expression in wide variety of hosts. Applications of genetic engineering in agriculture, therapeutics and industry will be covered.	
Content:		
1.	Introduction to genetic engineering and tools involved in genetic manipulation	(16)
1.1	Introduction to genetic engineering	
1.2	Tools and techniques involved in genetic manipulation	
A.	DNA modifying enzymes: restriction endonucleases, exonucleases, DNA ligases (T4 DNA Ligase and <i>E.coli</i> DNA ligase), Terminal DNA transferase, DNA Polymerases (Taq, Amplitaq, vent, Exo-vent, Pfu, T4 etc), Reverse transcriptase, T4 polynucleotide kinases, Alkaline phosphatase, S-1 Nuclease, Mung bean nuclease, RNases.	
B.	Gene cloning systems/Hosts: Gene cloning in <i>E. coli</i> and other organisms such as <i>Bacillus subtilis</i> , <i>Saccharomyces cerevisiae</i> and other microbial eukaryotes.	
C.	Cloning vectors: plasmid (pUC19, pBR 322), λ phage based vectors, cosmid vectors, Phasmid vectors, shuttle vectors, High capacity Cloning vectors (BAC and YACs).	
D.	Sequencing Vectors: pUC 19 and M-13 Phage vector.	
E.	Expression vectors: Prokaryotic (pET, pGEX-2T and others). Characteristics of expression vectors: strong bacterial and viral promoters (lac, trp, tac, SV 40, T7, T3) for induction of gene expression.	
F.	Construction of rDNA molecule and its transfer to appropriate host (bacteria/yeast/plant cell/animal cell) using a suitable technique: transformation, electroporation, transfection, gene gun.	
G.	Other Recombinant DNA techniques: Use of radioactive and non-radioactive nucleotides for DNA probe preparation and detection of hybrids, Gel retardation assay, Restriction mapping, RFLP, PCR, RT-PCR, Real time PCR, Microarray, DNA sequencing using Sanger's Dideoxy chain termination method and automated sequencer; chromosome walking, Hybrid release and hybrid arrest translation to screen clones, site directed mutagenesis.	

2.	Application of Genetic Engineering in Biology, forensics and medicine	(10)
2.1	Application of genetic engineering in DNA diagnostics and production of recombinant drugs, vaccines and hormones	
A.	Screening of Genetic diseases using DNA probes (DNA diagnostics).	
B.	Production of recombinant proteins and drugs (insulin, tissue plasminogen activator, erythropoietin, human growth hormones, Antibodies (including bispecific antibodies), vaccines, interferons, DNA vaccines: merits and demerits, Edible vaccines- merits and demerits.	
C.	Application of recombinant DNA technology in solving parental dispute and criminal cases (DNA finger printing).	
2.2		
A.	Manipulation of gene expression in Prokaryotes; , gene expression from strong and regulatable promoters, Developing fusion proteins and separation of cloned protein by protease induced cleavage.	
B.	Genetic manipulation to increase recombinant protein stability and secretion using signal sequences.	
3.	Application of Genetic Engineering in Agriculture	(05)
3.1		
A.	Development of transgenic crops resistant to insect pests, bacterial, fungal and viral pathogens.	
B.	Strategies to develop transgenic crops and horticulture plants using various tools of recombinant DNA technology: Development of Bt Brinjal, Golden Rice and flavr savr tomato.	
C.	Importance of <i>Agrobacterium tumefaciens</i> in genetic manipulation of plants (Role of Ti plasmids), Role of <i>Bacillus thuringiensis</i> (Bt genes) to develop insect pest resistant crops.	
4.	Application of Genetic Engineering in Industry	(02)
4.1	Genetic engineering of microbes for production of enzymes, biomolecules and fermentation products.	
A.	Genetic manipulation of microbes to over-produce industrially valuable enzymes.	
B.	Production of microbial SCPs.	
5.	Application of Genetic engineering in Bioremediation, Biorecovery and Biomonitoring of xenobiotics, metals and organometals.	(03)
5.1	Genetic engineering of microbes for bioremediation and biomonitoring of toxic environmental pollutants, Biohydrometallurgy	
A.	Microbial bioremediation of xenobiotics by recombinant microbes.	
B.	Bioremediation of toxic heavy metals and organometals by recombinant microbes.	
C.	Biohydrometallurgy using recombinant microbes for recovery of precious metals.	

Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Old, R. W. and Primrose, S. B., Principles of Gene Manipulation: An introduction to Genetic Engineering, University of California Press.

	Gerhardt, P., Methods for General and Molecular Bacteriology, Elsevier.	
	Grinsted, J. and Bennett, P. M., Methods in Microbiology, Vol. 21, Plasmid Technology, Academic Press.	
Learning Outcomes	1. Understanding of tools and techniques involved in molecular cloning. 2. Overall understanding about the importance of GMOs, GMPs and other engineered products in science and industry.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 109

Title of the Course: GENETIC ENGINEERING [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Theoretical understanding of chromosomal DNA, plasmid DNA, selection media and preparatory microbiology is needed.	
Objective:	To have a hand on experience on plasmid DNA isolation, modification and insertion; basically a DNA cut-copy-paste technology that forms the basis of any genetic engineering wet lab.	
Content:		(24)
1.	Restriction mapping of bacterial plasmid and agarose gel analysis.	
2.	Preparation of competent cells and transformation of <i>E. coli</i> host with plasmid DNA using heat shock method and electroporator; confirmation of positive transformants.	
3.	Assessment of DNA ligation activity of T4 DNA ligase.	
Pedagogy:	Experiments in the laboratory	
References/Readings	As given under Theory Course MIO 105-T	
Learning Outcomes	1.A practical understanding of how the DNA modifying enzymes work. 2. Hand-on experience with plasmid and bacterial host.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 110

Title of the Course: IMMUNOLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Basic knowledge on pathogens, serology, and general principles of immunology.	
Objective:	It is to develop concepts in role and the underlying mechanisms for the functioning of immunological cells and their interactions. The regulations of molecule synthesis, signalling, immune responses and allied activities of immune system at the molecular level.	
Content:		
1.		
1.1	Phagocytosis – Cell surface receptors/markers and their role, killing mechanisms; NK cells – Cell to cell recognition for normal and modified cells, receptors, initiation of apoptosis and killing of target cells, malfunctioning of NK cells; role of mast cells in immunity.	(05)
1.2	Concept of immunoglobulin domain, distribution of immunoglobulin domain, superfamily member, structure and function of TCR, diversity of antigen binding domain, concept of segmented gene, gene organisation of Ig and TCR, generation of gene during differentiation and development of B and T Cells, expression of Ig and TCR Cistrons, class switch and regulation of expression, B and T Cell ontogeny.	(05)
1.3	Major Histocompatibility Cluster – Introduction to MHC I, II and III, structure and function of MHC I and II, distribution and recognition of MHC I and II, gene organisation and concept of polymorphism, expression and its regulation, processing of extracellular antigen by APC, presentation of intracellular antigen by nucleated cells, recognition of MHC I and II by TCR/CD3 complex; Members of MHC III and their roles (in brief).	(05)
2.		
2.1	Ontogeny of T- and B-cells, immunocompetent T and B cells, recognition, signalling and activation of T cells by APC, control and regulation of activated T-Cells, B-cell activation – Type 1 thymus-independent antigen, Type 2 thymus-independent antigen, thymus dependent antigen, co-operation with T-cells and activation of resting B-cells, antigen processing by B-cells, stimulation by cross-linking surface Ig.	(05)
2.2	Cytokine as messengers, receptor for cytokine – gp130 subfamily, beta-c and gamma-c receptor subfamily, signal transduction and effects, network interactions; TH1 and TH2 responses; Cytokine mediated chronic inflammatory response; Killer T Cell and its regulation; effect of antigen dose and maturation of affinity of antibodies; role of memory cells.	(05)

2.3	Antigen as major factor in control, feedback control of antibody production, T cell regulation – T-helper cells, T-cell suppression; Idiotypic networks, influence of genetic factors, immune regulation through hormone; T-cell tolerance.	(04)
3.		
3.1	Concept of inflammation (self-revision), complement fixation (self-revision), defence against intracellular bacterial pathogen, immunity to viral infection, immunity to fungi, immunity to parasitic infections; Passively acquired immunity, vaccination.	(03)
3.2	Immuno-techniques: Antigen antibody interactions in solution (self revision), identification and measurement of antigen (self revision), epitope mapping, hybridoma technology and monoclonal antibody revolution, catalytic antibodies, engineering antibodies, antigen-antibody based affinity chromatography (revision if done in techniques), isolation of leukocyte and subpopulations, localization of antigen <i>in cyto</i> and <i>in tissue</i> .	(04)
Pedagogy:	Lectures/tutorials/assignments/self-study/Moodle/videos	
References/ Readings	<ol style="list-style-type: none"> 1. Goldsby, R. A., Kindt, T. J. and Osborne, B. A., Kuby Immunology. W.H. Freeman 2. Bona, C. A. and Bonilla, F. K., Manual of Practical Microbiology and Parasitology, New Central Book Agency (P) Ltd, Delhi, India. 	
Learning Outcomes	<ol style="list-style-type: none"> 1. Explains the mechanisms of immunological responses. 2. Apply the principles of cellular ontogeny and the gene rearrangement to understand the novel and complex immune system. 	

Programme: M.Sc. (Microbiology)

Course Code: MIO 111

Title of the Course: IMMUNOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Basic knowledge of pathogens, blood and principles of immunology.	
Objective:	Hands-on practice for various techniques used in immunology.	
Content:		(24)
1.	Haemagglutination for Blood grouping ABO and Rh system	
2.	Immunodiffusion slide technique	
3.	Agglutination tests for <i>Salmonella</i> -antigens	
4.	ELISA	
5.	Rapid tests – Malaria antigens Pv/Pf, IgM/IgG antibodies for Dengue, Hepatitis HBsAg	
6.	Rheumatoid Arthritis Factor determination	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 106-T	
Learning Outcomes	Apply techniques in immuno-diagnosis.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 112

Title of the Course: EXTREMOPHILIC MICROORGANISMS [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	The student should have knowledge of microorganisms and their diversity.	
Objective:	This course gives insights about the extreme habitats, extremophilic microorganisms, their adaptations and biotechnological potentials.	
Content:		
1.	Concept of extremophiles v/s conventional microbial forms	(01)
2.	Extreme habitats in universe, extreme communities in following niches: deserts, rhizospheres, ore deposits/ mining areas (Fe, Mn, Cu), animal systems, deep biosphere (terrestrial and marine), hydrothermal vents.	(02)
3.	Significance in biogeochemical cycling, industry, pharma and degradation of xenobiotics	(02)
4.	Key Molecular components, Unique : physiological features, adaptation strategies and enzymes of various extremophilic types:	
A.	Anaerobes: oxygen toxicity and regulation in <i>Clostridium</i> , <i>Moorella thermoacetica</i> , Wood Ljungdahl pathway	(12)
B.	Barophiles/ Piezophiles: mechanism in barophily, alpha proteobacteria	
C.	Cryophiles, Psychrophiles: (cold shock proteins and regulation) <i>Polaromonas</i>	
D.	Thermophiles: heat shock proteins, sigma factors and regulation, <i>Aquifex</i> , <i>Tepidomonas</i> , <i>Rhodothermus</i>	
E.	Alkaliphiles/ basophiles: <i>Alkalimonas</i> , <i>Nesterenkonia</i>	(12)
F.	Acidophiles: <i>Picrophilus</i> , <i>Ferroplasma</i>	
G.	Halophiles: <i>Halomonas</i>	
H.	Osmophiles: Osmophilic <i>Lactobacilli</i> , <i>Schizosaccharomyces pombe</i>	
I.	Oligotrophs: <i>Pelagibacter</i>	
J.	Xerophiles: <i>Wallemia</i> , extreme cyanobacteria	(07)
K.	Radiophiles: <i>Deinococcus radiodurans</i>	
L.	Metallophilic: <i>Geobacillus</i>	
M.	Xenobiotic users: <i>Pseudomonas</i>	
N.	Endoliths: <i>Chroococcidiopsis</i> , <i>Halothece</i>	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Brock, T. D., Thermophilic Microorganisms and Life at High Temperatures, Springer, New York.	

	Horikoshi, K. and Grant, W. D., Extremophiles-Microbial Life in Extreme Environments, Wiley, New York.

	Rainey, F. A. and Oren, A., Extremophile Microorganisms and The Methods to Handle Them. In: Extremophiles, Methods in Microbiology, Vol. 35, Elsevier, Amsterdam.	
Learning Outcomes	Apply the knowledge to study the extremophilic microorganisms and tap their unique properties for ecological and industrial applications.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 113

Title of the Course: EXTREMOPHILIC MICROORGANISMS [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	The student should be familiar with handling of microorganisms in the laboratory.	
Objective:	This course teaches various skills involved in handling extremophilic microorganisms.	
Content:		(24)
1.	Isolation of halophiles, alkaliphiles, and anaerobes.	
2.	Tolerance of bacterial culture to varying salt concentrations.	
3.	Buffering capacity of alkaliphiles.	
Pedagogy:	Experiments in the laboratory	
References/Readings	As given under Theory Course MIO 107-T	
Learning Outcomes	Develop expertise in isolation and culturing of microorganisms thriving in extreme environment, and exploring the extremophiles to discover particular novel and unique useful biocompounds.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 114

Title of the Course: RESEARCH METHODOLOGY [T]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Basics of microbiology is necessary.	
Objective:	This course develops the concepts of research and covers all aspects ranging from biosafety in the laboratory, experimental protocol, presentation of data and viva voce.	
Content:		(12)
1.	Biosafety in laboratory	
2.	Ethics in research	
3.	Defining the problem	
4.	Literature survey	
5.	Defining the Aims and Objectives	
6.	Work Plan – Time-bound Frame	
7.	Research design	
8.	Experimental protocol	
9.	Presentation of data	
10.	Analysis and Conclusions	
11.	Presentations	
12.	Research manuscript writing	
13.	Thesis Writing	
14.	Viva Voce	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Kothari C. R., Research Methodology Methods and Techniques, New Age International.	
	Kumar, R. C., Research Methodology. APH Publ Corporation, New Delhi.	
	Good C. V., Scates, D. E., Methods of Research, Appleton-Century-Crofts.

	Alley, M., The Craft of Scientific Writing, Springer Science and Business Media.	
	Cooray P.G. Guide to Scientific and Technical Writing.	
Learning Outcomes	Skills to design, conduct an experiment and successfully process and report the observations in the form of a scientific report/manuscript/thesis.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 115

Title of the Course: RESEARCH METHODOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Basics of microbiology laboratory techniques is necessary.	
Objective:	This course develops the experimental approach, designing of experimental protocols, presentation of data and viva voce.	
Content:		(24)
1.	Literature survey on a given research area.	
2.	Designing an experiment with respect to a given objective.	
3.	Experimental work.	
4.	Presentation of data.	
5.	Technical writing.	
6.	Literature survey on a given research area.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 108-T	
Learning Outcomes	Skills to design an experiment and process the data acquired and successfully report the observations in the form of a scientific report/manuscript/thesis.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 116

Title of the Course: MICROBIAL TECHNOLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students have a basic knowledge of different techniques in instrumentation- their principle and applications.	
Objective:	This course develops concepts in technologies used in agriculture, mining, energy production and human health with respect to microorganisms and genetically engineered microorganisms. Introduces concept of nanotechnology.	
Content:		
1.	Biotechnology and prospecting with microbes.	(04)
A.	Advantages of using microbial technology over chemical and physical technology.	
B.	Ethics in the use of GEMs.	
C.	Commercialization of Microbial Biotechnology.	
D.	Introduction to Nanotechnology.	
2.	Microbial technology in agriculture	(08)
	Production of microbial biofertilizers, biopesticides, soil conditioners to enhance crop yields.	
3.	Microbial technology in mining	(12)
A.	Bioleaching.	
B.	Biomining.	
C.	Recovery of oil. MEOR	
D.	Microbial technology in waste and pollution management in mining: Bioconversions, Bioremediation, Biosedimentation, Bio-beneficiation, Aquifer cleaning.	
4.	Microbial technology for energy production	(07)
A.	Microbial fuel cell.	
B.	Biogas.	
C.	Microbial cell mass.	
5.	Microbial technology in Human health & aquaculture	(05)
	Pigments, Nutraceuticals, Probiotics, Bioplastics, Microbes as bio-weapons.	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	1. Arora, R., Microbial Biotechnology: Energy and Environment, CABI Publishing.	

	<ol style="list-style-type: none"> 2. Ahmad, I., Ahmad, F. and Pichtel, J. Microbes and Microbial Technology: Agriculture and Environmental Applications, Springer. 3. Peppler, H.J., Microbial Technology: Microbial Processes, Academic Press. 4. Sukla, L. B., Pradhan, N., Panda, S. and Mishra, B. K. Environmental Microbial Biotechnology, Springer. 5. Bull, A. T., Microbial Diversity and Bioprospecting, American Society for Microbiology. 	
Learning Outcomes	<ol style="list-style-type: none"> 1. Apply the knowledge of various techniques in developing technology for sustainable development. 2. Explain commercialization of a technology. 	

Programme: M.Sc. (Microbiology)

Course Code: MIO 117

Title of the Course: MICROBIAL TECHNOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students have a basic knowledge of different techniques in instrumentation- their principle, working and applications.	
Objective:	This course gives hands-on experience in designing experiments for determining effectiveness of biofertilizers and probiotics.	
Content:		(24)
1.	Determination of stability of microbial fertilizer.	
2.	Effect of microbes on sedimentation and clarification of water.	
3.	Probiotics: Isolation of LABs and their characterization- Gram staining, spore staining, lactose fermentation, Bile tolerance test, adherence efficiency.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 109-T	
Learning Outcomes	1. Explain the procedures for formulation of biofertilizers as well as probiotics. 2. Explain the role of microorganisms in clarification of water.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 118

Title of the Course: FOOD MICROBIOLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that students know the nutritional quality of food to microorganisms and presence and types of different microorganisms in the food.	
Objective:	This course deals with the beneficial and harmful association of microorganisms with the food and prospective application of the microorganisms in food industry. Teaches the methods of controlling the type and number of microorganisms in the food as per requirement. Teaches about the role of food regulatory bodies and measures of food safety and quality control.	
Content:		
1.	Microbial Food Spoilage and Food Preservation	(12)
A.	Predictive food microbiology - Types of foods and their spoilage.	
B.	Factors affecting the growth and survival of microorganisms in foods: Intrinsic, Extrinsic.	
C.	Preservation methods: Heat processing, low temperature storage, control of water activity, irradiation, high pressure processing, modified atmospheres, preservatives: chemicals, natural organic molecules (nisin).	
2.	Microbiology in Food Processes	(12)
2.1	Fermented and processed foods	
A.	Indian fermented foods.	
B.	Oriental fermented foods.	
C.	Fermentations: wine	
2.2	Genetically engineered microorganisms in the Food Industry	
A.	Concept and role of genetically engineered microbes in the food industry.	
3.	Food Safety and Quality Assurance	(12)
3.1	Food borne diseases	
	Bacterial, with emphasis on emerging pathogens such as <i>E. coli</i> EHEC O157:H7 and other strains; <i>L. monocytogenes</i> , <i>H. pylori</i> ; Fungal, Algal, Viral, Prions and other non-bacterial forms.	
3.2	Quality control and Validation	
A.	Microbiological examination of foods – sampling, culturing/analysis.	
B.	Plant sanitation.	
C.	Hazard Analysis and Critical Control Point (HACCP) concept.	
D.	Food Safety Act and Trade Regulations.	
E.	Good Manufacturing Practice (GMP) and Quality Systems.	

Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Adams, M. R. and Moss, M. O., Food Microbiology, New Age International (P) Limited Publishers, New Delhi.	
	Frazier, W. C. and Westhoff, D. C., Food Microbiology, M. C. Graw-Hill Companies, Inc., New York.	
	Jay, M. J., Loessner, M. J. and Golden, D. A., Modern Food Microbiology, Springer Science + Business Media Inc., New York.	
	Da Silva, N., Taniwaki, M. H., Junqueira, V. C. A., Silveira, N. F. A., Nascimento, M. S. do. and Gomes, R. A. R., Microbiological Examination Methods of Food and Water: A Laboratory Manual, CRC Press, Taylor & Francis Group, U.K.	
	Ramesh, K. V., Food Microbiology, MJP Publishers, Chennai.	
	Harrigan, W. F., Laboratory Methods in food Microbiology, CRC Press, Taylor & Francis Group.	
	Doyle, M. P. and Buchanan, R. L., Food Microbiology: Fundamentals and Frontiers, ASM Press.	
Learning Outcomes	Apply the knowledge about the food preservation, food fermentation, food safety, quality control and validation.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 119

Title of the Course: FOOD MICROBIOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that the student should have knowledge about handling of microorganisms.	
Objective:	Assessing the microbiological quality of food and role of microorganisms in food fermentations.	
Content:		(24)
1.	Determination of the D value in heat treatment of foods.	
2.	Fermentation: Production of wine, monitoring of sugar reduction and alcohol production.	
3.	Assessment of sanitary status of an eatery – Examination of microflora from table surface; utensils; drinking water.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 110-T	
Learning Outcomes	Develop skills required to analyse food samples in food industry and different food agencies.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 120

Title of the Course: AGRICULTURE MICROBIOLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that the students have knowledge about microorganisms and their diversity.	
Objective:	The course deals with the information about Inter-relationship of soil and microorganisms, different groups of beneficial microorganisms in agriculture, microbes as biofertilizer, plant pathogen and biocontrol agent.	
Content:		
1.	Soil Microbiology	(12)
A.	Terrestrial Ecosystem, Pyramids and Econiches.	
B.	Types of Soil, soil Profile, Physico-Chemical Characteristics.	
C.	Suitability of soil for agriculture.	
D.	Soil Enzymes and significance.	
E.	Influence of microbial metabolism on soil chemistry & humus formation and its significance (humic and fulvic acids).	
F.	Factors influencing bacterial survival in soils: Biotic & Abiotic.	
G.	Establishment of microbial inoculant.	
H.	Rhizosphere and Rhizoplane Microflora.	
I.	Plant growth promoting Rhizobacteria, nitrogen fixation, phosphate mobilization and biocontrol of plant pathogens.	
2.	Beneficiary Microorganisms to plants	(12)
A.	Mycorrhiza – Ectomycorrhiza, Endomycorrhiza, VAM structure & significance.	
B.	Plant growth promoting hormones from microbes viz. bacteria and fungi & their significance.	
C.	Nitrogen-fixing microbes - Biochemistry and Genetics of free living and symbiotic nitrogen fixers viz. <i>Azotobacter vinelandii</i> , <i>Rhizobium</i> . Significance of <i>nif</i> H, D, K, A, L, nod, nodulin and <i>fix</i> genes in microbial nitrogen fixation.	
D.	Biofertilizers: An Overview.	
(i)	free living soil microbes fixing N ₂ (<i>Azotobacter</i> , <i>Azospirillum</i>).	
(ii)	<i>Rhizobium</i> / <i>Azorhizobium</i> , in symbiotic association with leguminous plants.	
(iii)	Free living cyanobacteria- <i>Nostoc</i> .	
(iv)	Associative cyanobacteria (symbionts)- <i>Anabaena azollae</i>	
(v)	<i>Azolla</i> as Biofertilizer.	
(vi)	Compost as Biofertilizer.	

E.	Microbial Pesticides – (Biocontrol agents for agriculturally important crop plants) – Development and their significance; Source Organisms: Bacteria- <i>Bacillus thuringiensis</i> , Bt based commercial products, other Bacilli producing pesticides; Fungi— <i>Beauveria bassiana</i> , Viruses-Baculoviruses for insect pest control.	
3.		(12)
	Plant Pathogens (bacterial, fungal, viral, viroid).	
	Virulence in plant pathogens - biochemical and genetic basis of virulence, toxins as virulence factors	
	Plant defense responses - anatomical changes, phytoalexins, alkaloids and other biocontrol molecules	
	Pathogen control - viral proteins in controlling viral diseases, mycoviruses against fungal plant pathogens, RNA and antisense RNA technology in disease control	
Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Alexander, M., Introduction to Soil Microbiology, Wiley.	
	Dadarwal, K. R., Biotechnological Approaches in Soil microorganisms for sustainable crop production, Scientific Publishers.	
	Subba Rao, N. S., Advances in Agricultural Microbiology, Oxford & IBH Publishers.

	Kumar, H. D., Modern Concepts of Microbiology, Vikas Publishing House Pvt. Ltd.	
Learning Outcomes	<ol style="list-style-type: none"> 1. Apply the knowledge of soil chemistry and significant biochemical processes of microbes to improve agricultural practices. 2. Apply the understanding about genetics of advantageous microorganisms to genetically modify and develop improved crops. 	

Programme: M.Sc. (Microbiology)

Course Code: MIO 121

Title of the Course: AGRICULTURE MICROBIOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	It is assumed that the student have knowledge about the soil properties and microbial interactions with plants.	
Objective:	Assessing the diverse parameters influencing the soil health. Studying the plant growth promoters and plant pathogens.	
Content:		(24)
1.	Isolation of plant growth promoters from soil showing phosphatase, urease and siderophore activity.	
2.	Morphological characterization of cyanobacteria, extraction and estimation of cyanobacterial pigments (chlorophyll a, carotenoids).	
3.	Isolation of microbial plant pathogen(s).	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 111-T	
Learning Outcomes	Apply the microorganisms to improve soil health, promote plant growth and eradicate the phytopathogens for flourishing agriculture and its yield.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 122

Title of the Course: MEDICAL MICROBIOLOGY AND EPIDEMIOLOGY [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Knowledge of microorganisms, pathogens and various infectious diseases.	
Objective:	Develops concepts in pathogenesis of various pathogens, its underlying mechanisms along with molecular interactions, leading to development of disease in the host. Develops principles of pathogen, host and environment in terms of its varied existence and interactions, leading to various epidemiological events.	
Content:		
1.		
1.1	Pathogenicity, virulence and virulence factor – historical perspective and definitions, course of infectious diseases, damage-response curve and classes of pathogen, growth of pathogen in host.	(04)
1.2	Pili, flagella, biofilm, quorum-sensing, iron scavenging, aggressins/impedins against host defence.	(03)
1.3	Host susceptibility, pre-disposing factor (nutritional, socio-economical, occupational, therapy, genetical), factors affecting immune systems; Receptors for pathogen – GalNacbeta1-4 gal moiety exposed on asialylated glycolipids, TLRs, regulation of host cell apoptosis; establishment of latent infection; TB, Streptococcal Pneumonia, Amoebic and Bacillary dysentery.	(07)
2.		
2.1	Exotoxins – Type III secretion system, AB – type toxins, examples (Tetanospasmin, diphtheria toxin, pertussis toxin). Endotoxin – structure, biosynthesis, assay, pathophysiological effects, excessive inflammatory response, endotoxin neutralizing compound, antagonists of LPS.	(06)
2.2	Cystic fibrosis, Spongiform encephalopathy.	(04)
3.		
3.1	Spatial, temporal and social distributions of communicable diseases, transmissibility of infections, cross-sectional studies, case-control studies, cohort studies, Models for Developing Epidemiological Theory, modeling tools, Rates and risks, Population dynamics, Epidemiological Statistics Relating Exposure and Disease, Simple Epidemic Processes.	(07)
3.2	Community acquired infection, infections in immunocompromised patients, Nosocomial infections, catheter associated infections, infections in patients with debilitating diseases, neo-natal infections; Vector borne diseases – vectors for transmission of infectious diseases, epidemiological cycles of vector borne diseases, control measures.	(05)

Pedagogy:	Lectures/tutorials/assignments/self-study/Moodle/videos/web resources	
References/ Readings	<ol style="list-style-type: none"> 1. Davis, B.D. et al., Microbiology. Harper and Row. 2. Gillespie, S.H. and Hawkey, P.M., Principal and Practice of Clinical Bacteriology. Wiley. 3. Struthers, J.K. and Westran, R.P., Clinical Bacteriology. CRC Press. 4. Chakraborty, P. and Pal, N.K., Manual of Practical Microbiology and Parasitology. Calcutta New Central Book Agency. 	
Learning Outcomes	<ol style="list-style-type: none"> 1. Explain the various pathological events during the progression of an infectious disease. 2. Apply the principles of epidemiological sciences in studying the underlying mechanisms of spread of disease and controls required thereof to combat the spread of pathogens. 	

Programme: M.Sc. (Microbiology)

Course Code: MIO 123

Title of the Course: MEDICAL MICROBIOLOGY AND EPIDEMIOLOGY [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Ability to handle microorganisms in the laboratory.	
Objective:	Hands-on training in handling, characterization and identification of pathogens. Analysis of epidemiological data.	
Content:		(24)
1.	Demonstration of malaria parasite in blood film.	
2.	Determination of sensitivity of bacteria to antibiotics (Disc method).	
3.	Enrichment, isolation and identification of Enteric pathogen.	
4.	Analysis of disease incidence using CDC/epidemiological data.	
Pedagogy:	Experiments in the laboratory, web resources	
References/ Readings	As given under Theory Course MIO 112-T	
Learning Outcomes	1. Apply the general principles of microbiology tools and techniques in specific need for clinical cases. 2. Apply the principles of statistics in processing of epidemiological data.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 124

Title of the Course: MARINE MICROBIAL INTERACTIONS [T]

Number of Credits: 3

Effective from Academic Year: 2018-19

Prerequisites	Students must have a background about the basic concepts of Marine Microbiology, including properties of seawater, marine microorganisms.	
Objective:	The focus of this Course is to advance the understanding of the students of marine microbiology with special emphasis on the intricate associations between microorganisms and marine organisms, diseases of microbial origin in fish and invertebrates, and other beneficial and harmful aspects like bioremediation and HABs respectively.	
Content:		
1.	Symbiotic associations	(12)
	Symbiosis of microalgae with animals; Symbiosis of chemoautotrophic prokaryotes with animal; Light organ symbiosis in fish and invertebrates; Microbial symbionts of sponges; Symbiosis and mixotrophy in protists; Metabolic consortia and mutualism between prokaryotes.	
2.	Microbial diseases of fish and invertebrates	(12)
	Diseases of fish, bivalve mollusks, crustaceans, corals in fresh water/ sea water/ aqua culture: Bacterial – vibriosis, furunculosis, bacterial kidney disease, mycobacteriosis, streptococcosis, black band disease, white plague, white pox, Juvenile Oyster Disease (JOD). Viral – Infectious salmon anemia (ISA) virus, viral hemorrhagic septicemia virus (VHSV), lymphocystis virus, birnaviruses, viral nervous necrosis. Protistan – <i>Paramoeba perurans</i> , <i>Kudoa sp.</i> , <i>Loma salmonae</i> , <i>Hematodinium</i> Diagnostic methods. Control of disease.	
3.	Marine microbes - Beneficial and harmful	(12)
	Beneficial aspects: Biodegradation and bioremediation of marine pollutants such as oil, persistent organics and plastics. Environmental monitoring using indicator microorganisms. Microbial enzymes and polymers. Harmful aspects: Harmful Algal Blooms (HABs). Biodeterioration, biofouling, bio-invasion – ballast waters.	

Pedagogy:	Lectures/tutorials/assignments/self-study	
References/ Readings	Grasshoff, K., Ehrhardt, M. and Kremling, K., Methods of Seawater Analysis, Verlag Chem., Weinheim.

	Toranzo, A. E., Magarinos, B. and Romalde, J. L., (2005) A review of the main bacterial fish diseases in mariculture systems, Aquaculture, 246(1): 37-61.	
Learning Outcomes	Explain the mechanisms underlying marine microbial communities and how they impact the environment.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 125

Title of the Course: MARINE MICROBIAL INTERACTIONS [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Students must have a background about the basic concepts of Marine Microbiology, and the techniques involved for sampling and processing of water, sediment, flora and fauna from the marine environment.	
Objective:	This Course emphasizes the techniques used to study the interactions between microorganisms and marine organisms, and also screening of enzymes for degradation of litter.	
Content:		(24)
1.	Determining <i>E. coli</i> in shellfish –MPN/ EC-MUG medium.	
2.	Isolation of luminescent bacteria from fish/shellfish.	
3.	Screening of enzymes involved in deterioration of wood/litter in marine environments.	
Pedagogy:	Experiments in the laboratory	
References/ Readings	As given under Theory Course MIO 113-T	
Learning Outcomes	Expertise in isolation and characterization of marine bacteria associated with fish/shellfish and enzyme studies.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 201

Title of the Course: STUDY TOUR / FIELD TRIP [P]

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Knowledge about microbiology-related institutes and industries in Goa.	
Objective:	To provide knowledge about the on-going research in various national research institutes and the functioning of microbiology - related industries and industrial processes.	
Content:		(24)
1.	Visit to National Research Institutes: National Centre for Antarctic and Ocean Research [NCAOR], National Institute of Oceanography [NIO] and ICAR – Central Coastal Agricultural Research Institute (ICAR - CCARI)	
2.	Visits to Industries:	
2.1.	Pharmaceutical industry	
2.2.	Agricultural farming	
2.3.	Food and beverage	
3.	Report writing	
4.	Presentation and group discussion	
Pedagogy:	Visits to research institutes/industries/universities, demonstration of equipment available with respective laboratories, interaction with personnel working in the field of microbiology in the respective institutes.	
References/ Readings	As suggested by the demonstrator to the participating students.	
Learning Outcomes	1. Exposure to the various research being carried out in the field of microbiology. 2. Exposure to the various activities being carried out in industries using/or related to the applications of microbial principles.	

Programme: M.Sc. (Microbiology)

Course Code: MIO 202

Title of the Course: TRAINING IN AN INSTITUTE/ INDUSTRY/ UNIVERSITY

Number of Credits: 1

Effective from Academic Year: 2018-19

Prerequisites	Knowledge about the basic techniques in microbiology.
Objective:	To provide hands-on experience in the application of microbiological techniques in research institutes/industries/universities. To experience the workings of microbiology-related departments in commercial industries.
Content:	<p>The student shall be required to</p> <ol style="list-style-type: none">1. Undertake training for a minimum period of 10 working days or its equivalent.2. Submit to the Department of Microbiology, Goa University, a certificate of attendance signed by the Training Coordinator of the respective Institute/ Industry/University.3. Submit to the Department a Report of the work undertaken.4. Make a Presentation of the work carried out, to the Department Council for evaluation.
Pedagogy:	Short-term internship (minimum 10 days) at an institute/industry/university
References/ Readings	As suggested by the demonstrator to the participating students.
Learning Outcomes	Apply the tools and techniques of microbiology to a range of situations.

Programme: M.Sc. (Microbiology)

Course Code: MID

Title of the Course: DISSERTATION

Number of Credits: 8

Effective from Academic Year: 2018-19

Prerequisites	Laboratory training in microbiology.
Objective:	Develop the skills of preparing and conducting independent research.
Content:	
1.	Review of the state of research in a particular problem involving microorganisms, and development of hypothesis.
2.	Planning and conducting the experiments.
3.	Periodic analysis of data and preparation of report.
4.	Final preparation of project report as dissertation to be submitted as partial fulfilment of M.Sc. Programme.
Pedagogy:	Project carried out individually by each student throughout the academic year
References/ Readings	As required for the development of review and methodology.
Learning Outcomes	Ability to apply the tools and techniques of microbiology in conducting independent research.

Goa University

Goa University, Taleigao Plateau, Goa 403 206

Syllabus of M.Sc. (Zoology) Programme

(To be followed from the Academic year: 2020-21)

Programme Name: M. Sc. Zoology

Programme Code: ZO

Programme description:

This program is intended to develop learning about Zoology and significance of fauna ranging from single cell to multi-cellular systems. Keeping in mind the Departmental thrust area “Biodiversity and Comparative Animal Physiology”, the current Post graduation curriculum has been totally restructured. A precise balance between the classical courses and modern biological courses has been made to introduce and emphasize the skill based programmes with an Internship experiences. Apart from the classical topics on Animal Sciences namely, Taxonomy and Systematics; Biodiversity; Anatomy of Non- chordates and Chordates, Genetics and Ecology this syllabus also covers topics on various aspects of Life Processes such as Animal Physiology, Developmental Biology and Molecular Biology. The restructured M. Sc. programme also focuses on various application based or skilled based courses such as Fishery Sciences and Fish Farm Management, Food Processing, Environmental Physiology, Neurophysiology, Stem Cell Biology, Herpetology, Ornithology, and Wild Life Biology. Besides, the courses like Immunology, Cell Biology, Biological Techniques, Biostatistics, Vector Biology, Biological Data Base programs also represent this restructured syllabus. This programme through the dissertation will also help the students to understand the basic principles of nature and will also provide scope for hands-on experience to experiment with nature /animals and thereby enable them to develop aptitude for research in various allied fields of animal sciences.

This curriculum will also enable them to overcome several day to day problems faced by our society by providing them with some workable solutions.

Prerequisite for M. Sc. Zoology Programme:

The candidate must pass the Bachelors degree examination in Zoology at T. Y. B.Sc. level or its equivalent credits in Zoology.

Programme Structure:

A student should earn a minimum of 64 Credit Courses to receive M.Sc. (Zoology) degree. Out of 64 credits, 32 credits shall be of Departmental Core Courses to be earned during Semester I and II and 32 credits are Optional Courses (Including Departmental skilled based optional and general optional / Interdisciplinary / Dissertation) to be earned during Semester III and IV. Active participation in Field work component as well as short internship program, included in the laboratory courses, is must for every student. There is also liberty to carry out Dissertation work in any sister departments of Goa University / neighbouring Institute (within Goa) / in the Industry (within Goa) but it should be under the supervision of one of the faculty members of the Zoology Department.

Also, all the Core Courses have to be studied by all students in the first year (Semester I & II). Dissertation (8 Credits) is optional in lieu of equivalent number of credits of courses from the Optional Courses and shall be undertaken in the second year (Semester III & IV).

Timeline for completion of various credits over four Semesters:

SEMESTER	SEM I	SEM II	SEM III	SEM IV
CORE COURSE				
FIELD WORK (included in the lab course)				
SKILLED BASED OPTIONAL COURSE				
INTERNSHIP (included in the lab course)				
SOFT OPTIONAL COURSE				
DISSERTATION				

Note: Empty spaces represent the timeline for the courses indicated

CORE COURSES			
Semester I and II Each Semester 16 credits			
			Page Nos
ZOC 101	Principles of Animal Systematic	3 credits	7
ZOC 102	Anatomy of Non- Chordates	3 credits	9
ZOC 103	Animal Biochemistry	3 credits	11
ZOC 104	Molecular Biology	3 credits	13
ZOC 105	Laboratory Course 1 (Field work included)	4 credits	17
ZOC 201	Comparative Anatomy of Vertebrates	3 credits	19
ZOC 202	Comparative Physiology of Animals	3 credits	21
ZOC 203	Advanced Developmental Biology	3 credits	23
ZOC 204	Ecology	3 credits	25
ZOC 205	Laboratory Course 2 (Field work included)	4 credits	27

OPTIONAL COURSE			
Semester III and IV			
Each Semester 16 credits			
Cluster A: Aquaculture			Page Nos
ZOO 301	Fishery Biology	3 credits	30
ZOO302	Fish Farm Management	3 credits	32
ZOO 303	Fish Processing	3 credits	34
ZOO 304	Laboratory Course on Aquaculture (1-month Internship included)	3 credits	36
Cluster B: Life Processes			
ZOO 305	Environmental Physiology	3 credits	37
ZOO 306	Neurophysiology	3 credits	39
ZOO 307	Stem Cell Biology	3 credits	41
ZOO 308	Laboratory Course on Life Processes (1-month Internship included)	3 credits	43
Cluster C: Field Biology			
ZOO 309	Ornithology	3 credits	44
ZOO 310	Herpetology	3 credits	46
ZOO 311	Wild Life Conservation & Management	3 credits	48
ZOO 312	Laboratory course on Field Biology (1-month Internship included)	3 credits	51
NOTE	STUDENT HAS TO OPT ANY ONE CLUSTER.		
		12 credits	
ZOO 313	Toxicology (Theory and Practical)	3 + 1 credits	52
ZOO 314	Advanced Cell Biology (Theory and Practical)	3 + 1 credits	54
NOTE	STUDENT HAS TO OPT ANY ONE	4 credits	
ZOO 401	Animal Genetics	3 credits	56
ZOO 402	Biodiversity	3 credits	58

Interdisciplinary Courses			
ZOO 403	Evolutionary Biology	2 credits	60
ZOO 404	Endocrinology	2 credits	62
ZOO 405	Biostatistics	2 credits	64
ZOO 406	Vector Biology	2 credits	65
ZOO 407	Histology and Histochemistry	2 credits	67
ZOO 408	Helminthology	2 credits	68
ZOO 409	Ethology	2 credits	70
ZOO 410	Biological Techniques	2 credits	71
ZOO 411	Introduction to Biological database	2 credits	73
ZOO 412	Scientific Communications	2 credits	75
ZOO 413	Immunology	2 credits	77
ZOO 414	Nutritional Biochemistry	2 credits	79
NOTE	STUDENT HAS TO OPT ANY FIVE	10 CREDITS	
ZOO 415	Dissertation	8 credits	--
NOTE	Dissertation should be for the entire Semester III and Semester IV. It is in lieu of 4 interdisciplinary courses, equivalent to 8 credits.		

Course Code: ZOC 101
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Principles of Animal Systematics

Prerequisite for the Course:	Basic working knowledge of classical and animal taxonomy and systematics.	
Objectives:	This course develops concepts in animal taxonomy and systematic, modern methods of taxonomy and systematics and their application, General Organization and molecular basis of animal taxonomy.	
Content:	<p>Module 1</p> <p>Introduction to taxonomy, stages of taxonomy, importance of taxonomy, rise of taxonomy. 2 hours</p> <p>Principles and rules of taxonomy, Zoological nomenclature, ICZN regulations, new trends in taxonomy, Zoological classification, problems of taxonomists. 4 hours</p> <p>Taxonomic collections, identification and description, Taxonomical hierarchy (Linnaean hierarchy), Concepts of Taxon, holotype, paratype, topotype etc. 4 hours</p> <p>Concept of speciation: Biological, Phylogenetic and Evolutionary. 2 hours</p> <p>Module 2</p> <p>Morphology based taxonomy, Numerical taxonomy, Immuno-taxonomy, Paleotaxonomy, Cyto-taxonomy and Chemotaxonomy. 4 hours</p> <p>Molecular basis of animal taxonomy, Genetic polymorphism, electrophoretic variations, amino acid sequencing for variety of proteins, DNA-DNA and DNA-RNA hybridization. 4 hours</p> <p>Systematics - definition and role in biology, Biological classification, Molecular systematics, DNA finger printing and molecular markers for detection/evaluation of polymorphism, RFLP, RAPD etc. 4 hours</p>	

	<p>Module 3</p> <p>Phylogenetics: Introduction; Basic terminology, Homology: Convergence, parallelisms and reversals.</p> <p>Phylogentic groups: monophyly, polyphyly, paraphyly.</p> <p>Construction of Phylogenetic trees, by using Cladistics and Phenetic related methods. Cladistics and Cladogram: Parsimony and finding the shortest trees, rooting trees.</p> <p>Molecular divergence, molecular clock, molecular drive.</p>	<p>3 hours</p> <p>1 hour</p> <p>6 hours</p> <p>2 hours</p>
Pedagogy:	Lectures/ tutorials/online teaching mode/self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand historical and modern methods of animal classification and systematics. 2. Get acquainted with field techniques for taxonomic study and use of literature and identification key. 3. Familiarise with Molecular basis of animal taxonomy. 	
References /Reading:	<ol style="list-style-type: none"> 1. Avise JC (2004), Molecular Markers, Natural History and Evolution, Chapman & Hall, New York. 2. Course Code: ZOC 102
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Anatomy of Non-Chordates

Prerequisite for the Course:	Basic knowledge on Non-chordate anatomy, taxonomy and systematics is prerequisite for this course.	
Objectives:	<p>To develop knowledge about fundamental anatomical principles among non-chordates.</p> <p>To understand the adaptive changes anatomical structures have undergone in the course of evolution.</p>	
Content:	<p>Module 1</p> <p>Skeletal system types: Endoskeleton-like (Poriferans), Exoskeleton (Arthropods) and Hydrostatic skeleton (Cnidarians, Molluscs and Echinoderms).</p> <p>Annelid Locomotory organs involved in Simple propulsion, Burrowing, Peristaltic waves, Sinusoidal and Inchworm type of locomotion. Primitive and advanced flight muscles of insects.</p> <p>Diffused, Simple ganglionic, Cycloneurialian, Heteroganglionic types of non-chordate Nervous system. Tetraneury plan of molluscan nervous system, Streptoneury, Euthyneury and centralization in molluscs.</p> <p>Module 2</p> <p>Digestive system types: Channel-network systems, Coelenteronic, Saccular and Tubular systems. Radula of Molluscs and various types of mouthparts in Arthropods.</p> <p>Coelomoduct derived, Gut derived and other excretory organs of non chordates. Calciferous Gland of Earthworms.</p> <p>Reproductive system in arthropods with Gonad-Gonoduct-Gonopore concept with addition of adjunctive organs.</p> <p>Module 3</p> <p>Respiratory organs and specialized respiratory structures of Annelids, Molluscs and Arthropods.</p>	<p>4 hours</p> <p>4 hours</p> <p>6 hours</p> <p>4 hours</p> <p>4 hours</p> <p>3 hours</p> <p>5 hours</p>

	Open and Closed circulatory system concept of Invertebrates. Circulatory system in Annelids, Arthropods and Molluscs. Hearts of Oligochaetes and Bivalves.	6 hours
Pedagogy:	Lectures/ tutorials/ online teaching mode/self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand the basic concepts associated with each system of the body. 2. Identify structures that are in place in the body systems to perform the functions according to the habits or habitats of the animals. 	
References /Reading:	<ol style="list-style-type: none"> 1. Hymen LH (1951), The invertebrates (all volumes), McGraw Hill, Philadelphia, USA. 2. Course Code: ZOC 103
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Animal Biochemistry

Prerequisite for the Course:	Elementary knowledge on structural biochemistry of Protein, Carbohydrate and Fat.	
Objectives:	To understand the biochemical integrity of various metabolic pathways. To understand metabolic pathways, their regulation, and application in diagnostic and maintenance human well being state.	
Content:	<p>Module 1 Water as biological solvent; Ionization of water and buffering in biological system.</p> <p>Enzyme Kinetics and enzyme inhibition; Catalytic and Regulatory strategies of Enzymes.</p> <p>Concept of metabolism; Concept of free energy; Coupled reaction; TCA cycle; Electron transport system; Oxidative phosphorylation.</p> <p>Module 2 Regulation of Glycolysis & Gluconeogenesis, Glycogenolysis & Glycogenesis.</p> <p>Integration of Fatty acid synthesis & β Oxidation of fatty acid; Importance of Cholesterol and Lipoprotein in health management; Eicosanoids : types, outline of biosynthesis and their physiological importance.</p> <p>Metabolism of Purine and Pyrimidines.</p> <p>Module 3 Protein and peptide chains; Primary-, Secondary-, Tertiary- and Quaternary structures of protein; Purification of proteins.</p> <p>Protein turn-over and amino acid catabolism; Nitrogen</p>	<p>3 hours</p> <p>5 hours</p> <p>4 hours</p> <p>4 hours</p> <p>6 hours</p> <p>2 hours</p> <p>4 hours</p> <p>4 hours</p>

	<p>excretory pathways; Oxidation of amino acids; Bio-synthesis of amino acids in animal.</p> <p>Integration of metabolism; Caloric homeostasis; Membrane receptors; Role of calcium and calmodulin in metabolism.</p>	4 hours
Pedagogy:	Lectures/ tutorials/ online teaching mode/self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understanding the various metabolic pathways 2. Understanding the regulation of various metabolic pathways. 3. Understanding the integrative metabolism and life processes. 4. Understanding the application of metabolism in maintenance of human well being state. 	
References /Reading:	<ol style="list-style-type: none"> 1. Devlin TM (2010), Text book of Biochemistry with Clinical Correlations, Willey, Oxford. 2. Pelley J (2012), Elsevier's Integrated Biochemistry, Elsevier Publication, Amsterdam, The Netherlands. 	

Course Code: ZOC 104
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Molecular Biology

Prerequisite for the Course:	Basic knowledge of nuclear and cellular components and functioning of the cell.	
Objectives:	This course develops concepts in molecular biology enhancing knowledge about the major processes in the cell throwing light upon the details of the central dogma. This knowledge is a prerequisite for biomedical/ biochemical research and shall enable students to have a clear understanding of all the dynamic processes of the nucleus which can be further applied in various fields of research.	
Content:	<p>Module 1 Nucleic Acids, bonds, types of DNAs, DNA packaging and model organisms.</p> <p>Watson and Crick to double helix DNA model. Research work of Rosalind Franklin, Maurice Wilkins, Linus Pauling and Erwin Chargaff on DNA structure. RNA structure. The triple helical structure of the collagen protein by Dr. G.N Ramachandra, and Ramachandran Plot. Different bonding and different types of DNA (B-DNA, A-DNA & Z-DNA).</p> <p>DNA packaging in bacteria (Nucleoid) and Eukaryotes. Chromatin structure, structural features (Telomere, Centromere and Repetitive sequences) of chromosomes and their functions. Lampbrush and polytene chromosomes. Karyotyping (C-banding, G-banding); Chromosomal aberrations and diseases</p> <p><i>Drosophila melanogaster</i> and <i>Caenorhabditis elegans</i> genetic model organisms.</p> <p>Evolution of Genomes: Gene duplication, whole genome duplication, transposable elements, Exon shuffling, Genome reduction and gene loss, mutations, horizontal gene transfer. Paralogous, orthologous, Homeobox genes; and degenerative evolution.</p> <p>Module 2 DNA Damage and DNA Repair Types of DNA damages: Double stranded break, single stranded break, Mismatch, deamination, Thymidine dimer, inversion, deletion,</p>	12 hours

	<p>insertion, Covalent X-linking, AP site.</p> <p>Different types of Mutagens: Base analogues (5-Bromouracil and 2-amino purines), EMS, acridines, NTG, Hydroxylamine; mutagenic radiations- UV, X-rays and gamma rays. Ames test; Auxotrophy; Somatic and germline mutations with examples in Human</p> <p>DNA repair mechanisms in Eukaryotes and Prokaryotes: Nucleotide Excision repair, mismatch repair, recombination repair, homologous end joining, photo reactivation and SOS Repair.</p> <p>Homologous recombinational repair: Role of <i>RecA/RadA/Rad51</i> in DNA damage repair. Role of BRCA1 in DNA damage repair. Mutation in BRCA1 as development of breast cancer. Role of p53 protein in DNA repair and tumor suppressor.</p> <p>Module 3 How cells read the Genome DNA to Protein: Replication process in prokaryotes and Eukaryotes: Rolling circle/theta model, telomere replication.</p> <p>Transcription in prokaryotes: prokaryotic promoters, Rho dependent and Rho independent transcription termination.</p> <p>Transcription and Post transcriptional modifications in eukaryotes: Eukaryotic promoters, transcription factors and RNA polymerase I, II, III. Transcription Inhibitors. Splicing, 5'-capping, 3'-poly A tail. Various non coding RNAs and their role in different biological processes: rRNA, tRNA, snoRNA, snRNA, exRNAs, scaRNAs, gRNA, Telomerase RNA, long ncRNAs (Xist and HOTAIR).</p> <p>Translation of mRNA in prokaryotes and Eukaryotes: Initiation, elongation and termination. Polycistronic and monocistronic mRNA. Shine-Dalgarno (SD) Sequence, Kozak sequence, IRES sequence, Ribosomes, Genetic code, codon bias, wobble hypothesis, degeneracy of codon. Posttranslational modification of proteins (Protein splicing, phosphorylation, methylation, N-linked glycosylation). Inhibitors of protein synthesis (Aminoglycosides and macrolide antibiotics, Puromycin).</p>	<p>12 hours</p> <p>12 hours</p>
--	--	---

	<p>RNA world and origin of life: Ribozymes (Ribonuclease P, self-splicing introns I and II, spliceosome, viroids, hair pin ribozyme, hammer head ribozyme). Some viruses contain RNA as genetic material e.g. TMV, HIV; Concept of reverse transcription; Viroid, Virusoid, Prions.</p> <p>Regulation of Gene expression in Prokaryotes and Eukaryotes: Heterochromatin and euchromatin – acetylation, phosphorylation, methylation. Epigenetics. Gene dosage effect. Real time PCR technology (qPCR): Absolute quantification and Relative quantification, Cycle threshold (Ct values), SYBR Green Technology and Taq Man probe technology. Various Reporter dyes and quenchers used in Taq Man probe technology. Multiplexing with real-time PCR technology.</p> <p>Regulation of gene expression at transcription level in prokaryotes: <i>lac</i> operon and <i>trp</i> operon. transcriptional attenuation.</p> <p>Regulation of gene expression at transcription level in eukaryotes: Enhancers, silencers, transcription factors (DNA binding motifs and their role in gene regulatory proteins).</p> <p>Post transcriptional regulation of gene expression: Riboswitches, Alternate splicing, trans splicing, RNA editing, RNA Interference (miRNA, siRNA, piRNA, Fire and Mello Nobel Prize winning experiment).</p> <p>Concept of Transcriptomics and Proteomics. Their application in research and Medical or diagnostics.</p> <p>CRISPR Cas9 Technology: Gene editing. Application of this technology in Medicine.</p>	
Pedagogy:	Lectures/tutorials /online teaching mode/ self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. State-of-art knowledge of molecular organisation of chromosomes and genes. 2. Decipher the role of large numbers of molecular events associated with model animal systems and its application in molecular research. 	
References /Reading:	<ol style="list-style-type: none"> 1. Clark D, Pazdernik N and McGehee M (2018), Molecular Biology. 3rd Edition, Academic Cell. 2. Davis LG, Dibner MD and Battey JF (1986), Basic Methods in Molecular

Course Code: ZOC 105
 Number of Credits: 4
 Effective from AY: 2020 -21

Course Title: Laboratory Course I

Prerequisite for the Course:	Basic working knowledge of animal systematics, animal anatomy, biochemistry, molecular biology.	
Objectives:	Laboratory hands on training in certain area of systematics, anatomy, biochemistry and molecular biology. To do a field Survey.	
Content:	<p>Animal Taxonomy and Systematics</p> <p>1. Systematic analysis with proper morphological keys and construction of Phylogenetic keys of the following:</p> <ul style="list-style-type: none"> - Malacofauna - Lepidoptera - Avifauna - Ichtyofauna - Araneae <p>Anatomy of Non Chordates</p> <p>I. Dissection</p> <ol style="list-style-type: none"> 1. Study of Nervous, in Cockroach/Crab (collected from market) 2. Digestive in Prawn (collected from market)/Cockroach and 3. Reproductive system in Cockroach. <p>II. Mounting</p> <ol style="list-style-type: none"> 1. Mounting of Heart in Bivalves 2. Mounting of Visceral and Pedal ganglia in Bivalves. 3. Comparative study of mouth parts in insects. <p>Biochemistry</p> <ol style="list-style-type: none"> 1. Extraction and Estimation of major bio molecules in different tissues of fish. Total Protein & free amino acids / glycogen & glucose/ triglycerides & fatty acid. 2. Determination of K_m and V_{max} of Na^+-K^+-ATPase/ Acetylcholinestarease. 3. Separation of serum Proteins through SDS-PAGE. (demo) 4. Fractionation of Lipid moieties through TLC. (demo) 5. Titration of an acid with conjugated base. 	<p>10 lab hours</p> <p>10 lab hours</p> <p>10 lab hours</p>

	<p>Molecular Biology</p> <ol style="list-style-type: none"> 1. Isolation of Purine/Pyrimidine bases from Nucleic acids and their analysis through spectrophotometer. 2. Separation of Nucleic acids on Agarose gel and relative quantification. 3. Fluorescent In-situ Hybridization using Fluorescent microscopy. 4. Restriction Endonuclease digestion and mapping. 5. m RNA expression studies through PCR <p>Field Work</p> <p>Faunistic survey around 1 km radius of his/ her residence during dawn of every weekend for at least 2 month (8 weeks) using Transect or Quadrangle method of two different fauna. One/ Two day visit to Sanctuary in Goa.</p> <p>* In unavoidable circumstances overnight field work will be replaced by extending the time period (from 8 weeks to 10 weeks of weekend faunistic survey).</p> <p>*Evaluation of the field work component will be based on weekly field note and final compiled field report during SEA.</p>	10 lab hours
Pedagogy:	Practicals/ Mini projects/ Group Activities.	
Learning Outcome:	<p>Practicals will give hands on training on certain areas based on courses on systematics, anatomy, biochemistry and molecular biology.</p> <p>To know the fauna surrounding own's house.</p>	
References /Reading:	As mentioned under individual course ZOC 101, 102, 103 & 104.	

Course Code: ZOC 201

Course Title: Comparative Anatomy of Vertebrates

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Basic knowledge on vertebrate anatomy, taxonomy and systematics is prerequisite for this course.	
Objectives:	To develop knowledge about fundamental anatomical principles among vertebrates. To understand the adaptive changes anatomical structures have undergone in the course of evolution.	
Content:	Module 1 Detailed comparative analysis of Vertebrate brain, Spinal cord and Sense organs. Basic plan of vertebra construction. Axial and Appendicular skeleton of vertebrates and their modification. Classification of vertebrate musculature. Axial and Appendicular musculature of Vertebrates.	4 hours 4 hours 4 hours
	Module 2 Digestive system of Vertebrates with special analysis of Herbivore, Carnivore and Omnivore stomach. Excretory system of Tetrapods, Mammalian kidney in detail, Specialized excretory structures such as Rectal Glands (elasmobranchs) and salt glands (reptiles and Birds). Testes and Vasa deferens in anamniotes and amniotes. Ovary and Oviduct of anamniotes and amniotes.	5 hours 4 hours 3 hours
	Module 3 Respiratory structure of fishes, Types of Tetrapod lungs (Alveolar, Faveolar, Parabronchial and Broncho-alveolar). Circulatory systems of Vertebrates, Vertebrate portal systems, Lymphatic system in Tetrapods.	6 hours 6 hours

Pedagogy:	Lectures/ tutorials/ online teaching mode/self-study
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand the basic concepts associated with each system of the body. 2. Identify structures that are in place in the body systems to perform the functions according to the habits or habitats of the animals.

Course Code: ZOC 202
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Comparative Physiology of Animals

Prerequisite for the Course:	Elementary knowledge on animal anatomy, Physiology taxonomy and systematics.	
Objectives:	<p>To provide knowledge of animal body system to reveal physiological homologies, patterns of physiological adaptation to various environments.</p> <p>To introduce various principles that underlies higher level integrative bodily functions.</p> <p>To provide a comprehensive knowledge of functional physiological pathways common to all animals.</p>	
Content:	<p>Module 1</p> <p>Nutrition (Feeding and digestion) in Non-chordates. Metagenome of mammalian Gut, Rumen fermentation. Movements of GI tract, control and reflexes. Concept of Gut brain Axis.</p> <p>Excretion and Osmoregulation in Non-chordates in fresh water, marine water and terrestrial environment. Contributions of Crustacean Antennal Glands and Molluscan Mantle to Acid-Base Regulation. Urine formation in Metanephros kidney, Nephrolithiasis-mechanism of Renal stone formation.</p> <p>Module 2</p> <p>Composition of Coelomic fluid and hemolymph of Non-chordates, Formation lymph. Physiological difference between Pulmonary and Systemic circulation of higher vertebrates and changes during pregnancy.</p> <p>Lung volumes and their physiological interpretations and changes in lung volumes during pregnancy. Ventilation – Perfusion Physiology.</p> <p>Conducting system of heart, Comparison of action potentials of Pacemaker cell and cardiomyocyte.</p>	<p>6 hours</p> <p>6 hours</p> <p>4 hours</p> <p>5 hours</p> <p>3 hours</p>

	Module 3 Various types of reproductive modes across Non-chordates, Uterine Physiology, Delayed implantation/Embryonic Diapause and its regulation, Estrous cycles and types of anestrus.	12 hours
Pedagogy:	Lectures/ tutorials /online teaching mode/self-study.	
Learning Outcome:	1. Understanding of the basic concepts and processes of physiological regulation, from cellular to organ to organismal. 2. Evaluation of physiological possibilities that animals have developed through natural selection.	
References /Reading:	1. Barnes RSK, Calow P, Olive PJW, Golding DW and Spicer JJ (2001), The Invertebrates: A Synthesis, Third edition, Blackwell Science. 2. Withers PC (1992), Comparative Animal Physiology, First Edition, Fort Worth, Saunders College Publication.	

Course Code: ZOC 203

Course Title: Advanced Developmental Biology

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Elementary knowledge of embryology.	
Objectives:	To understand the overall chronology of the development and the role of various morphogens (protein/mRNA) in specification and determination of various organs and body axis formation.	
Content:	Module 1 Mammalian Gametogenesis including the ultra structure of sperm and egg; Molecular events in mammalian fertilization (capacitation, prevention of polyspermy, genetic fusion , activation of egg metabolism). Cleavage in mammals, difference between somatic mitosis and cleavage, regulation of cleavage. Gastrulation (epiboly and emboly). Development of extra embryonic membrane. Module 2 Mechanism of cell cellular differentiation; Stages of Commitment (differentiation, specification and determination; Cellular communication: Paracrine factors and signal transduction cascades (Jak-Stat pathway, smooth and patched protein pathway, wnt signaling pathway, smad pathway) . Developmental dynamics of cell speciation: Specification of body axes in sea urchin-, insect-, fish-, avian- and mammalian embryo. Module 3 Induction and Competence; Cascade of induction during the formation of lens; epithelium-mesenchyme interaction during formation of feathers in bird.	5 hours 4 hours 3 hours 6 hours 6 hours 3 hours

	<p>The central nervous system and the epidermis: Primary and Secondary neurulation; Differentiation of the Neural Tube.</p> <p>Embryonic field; Pattern formation in Vertebrate Limbs, Generation of the Proximal – Distal, Anterior – Posterior, Dorso - Ventral axis of the Limb.</p> <p>Regeneration ability of animals; Role of Interstitial cells in Regeneration in Hydra. Molecular mechanism of regeneration of limb in Salamander.</p>	<p>3 hours</p> <p>3 hours</p> <p>3 hours</p>
Pedagogy:	Lectures/tutorials/online teaching mode/self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understanding the basic concept of the development 2. Understanding the cyto-differentiation and cellular communication during the process of development. 3. Boosting their concepts and knowledge regulation of gene expression and their interaction.

Course Code: ZOC 204
 Number of Credits: 3
 Effective from AY: 2020 -21

Course Title: Ecology

Prerequisite for the Course:	Basic knowledge on Taxonomy, Biodiversity, Environment and Ecology.	
Objectives:	This course will help the learner to understand the concept and components of ecology and its importance, population, community structures along with interactions. Overall the course develops an in depth understanding of the whole ecosystem ecology and the various related concepts. Additionally, this course also deals with emerging field of molecular ecology, conservation genetics and the environmental aspects highlighting the changing environment and global effects.	
Content:	<p>Module 1</p> <p>Introduction to ecology; Environment: Physical environment; biotic environment; biotic and abiotic interactions; Habitat and Niche: Concept of habitat and niche, niche width and overlap, fundamental and realized niche, resource partitioning, character displacement; Environmental concepts – laws and limiting factors, ecological models. Ecological structure: Review of six levels of ecological organization and their importance and characteristic features.</p> <p>Population Ecology: <u>Review</u> of Characteristics of a population; population growth curves; population dynamics, regulation and growth limits, fertility rate and age structure, life history strategies (<i>r</i> and <i>K</i> selection); concept of metapopulation – demes and dispersal, interdemec extinctions.</p> <p>Community Ecology: <u>Review</u> of nature of communities ,community structure and attributes, levels of species diversity and its measurement; edges, ecotones and related concepts.</p> <p>Module 2</p> <p>Ecological energetics: Primary productivity, Gross productivity, Net Productivity. Net ecosystem production and various levels of respiratory losses (Autotrophs, Heterotrophs and decomposer levels), Biomass, Standing crop and Turnover, The Residence Time of Energy, Limiting factors of primary production (Light and Nutrients), Eutrophication, Secondary production, Production efficiency, Earth's Heat budget.</p>	<p>6 hours</p> <p>3 hours</p> <p>3 hours</p> <p>5 hours</p>

	<p>Species Interactions <u>Review</u> of Types of interactions, intra-specific and inter-specific interactions, Mutualism, Commensalism, Competition, prey-predator interactions, herbivory, carnivory, pollination, symbiosis.</p> <p>Trophic ecology: Food web (Node, link, basal species, Top predators), Global comparisons of Marine food chains (Coastal regions, Open ocean and High upwelling areas), Types of food webs: connectedness webs, Energy flow webs and Functional webs; Topological webs, Flow webs and Interaction webs, Trophic cascades (Bottom-up and Top-down trophic level controls). Bioaccumulation and Bio-magnification.</p> <p>Module 3</p> <p>Ecological Succession: <u>Review</u> of Trajectory of Succession. Mechanisms/models of ecological succession (Facilitation, Inhibition, Tolerance), Alternative stable states and its model (stability, change & Hysteresis), Regime shifts and its models, Stability and sustainability (inertia/persistence, Constancy, Resilience)</p> <p>Biogeography: Major terrestrial biomes; theory of island biogeography; biogeographical zones of India.</p> <p>Restoration ecology: Ecosystem degradation and restoration model, restoration approaches (Reclamation, Revegetation, Re-creation and Ecological engineering), Structural and Functional restoration type, Active and Passive restoration types, Biomanipulation, Bioremediation and Biological augmentation strategies, restoration in India (Nirmal Ganga Action Plan).</p> <p>Molecular ecology: Genetic analysis of single and multiple population, phylogeography, molecular approach to behavioural ecology, conservation genetics.</p>	<p>2 hours</p> <p>5 hours</p> <p>4 hours</p> <p>2 hours</p> <p>4 hours</p> <p>2 hours</p>
Pedagogy:	Lectures/tutorials/online teaching mode /self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Essential in depth understanding of the concepts and components of ecology. 2. Learner will learn ecosystem structure and function along with the interactions involved at various levels. 	

	<ol style="list-style-type: none"> 3. Vision to understand the ecosystem ecology along with sufficient knowledge of energy flow and exchange. 4. Information about molecular ecology and conservation genetics. 5. Sensitization towards the environment with respect to the global scenario and the related problems, impact, along with methods to tackle the problems.

Course Title: Laboratory Course II

Effective from AY: 2020 -2128

	<p>Ecology</p> <ol style="list-style-type: none"> 1. Assessment of density, frequency and abundance of animals in a community using various techniques i.e. transect, quadrat etc. 2. Measurement of Productivity in ecosystems. 3. To study frequency of herbaceous species in a landscape and to compare the frequency distribution with Raunkiaer's standard frequency diagram. 4. To determine the biomass of a particular area. 5. Food web analysis and studies along with energy flow. 6. Decomposition of various organic matters and nutrient release mechanisms, quantification / role of arthropods and other micro-, and macrofauna in decomposition. 7. Biomagnification/Bioaccumulation analysis in ecosystems. 8. To study the biotic components of a water body. 9. Principles of GIS, GPS and Remote Sensing technology. 10. Interpretation (visual and automated) of remote sensing information for landscape differentiation. <p>Field Work</p> <p>Faunistic survey around 1 km radius of his/ her residence during dawn of every weekends for at least 2 months (8 weeks) using Transect or Quadrangle method of two different fauna.</p> <p>Visit to some National Park / Sanctuary and Some University and Research Institution out side Goa (within 1000 km from Goa) for 5 -6 days including Journey period.</p> <p>*In unavoidable circumstances overnight field work will be replaced by extending the time period (from 8 weeks to 10 weeks of weekend faunistic survey).</p> <p>*Evaluation of the field work component will be based on weekly field note and final compiled field report during SEA.</p>	12 hours
Pedagogy:	Practicals/ Mini projects/ Group Activities.	
Learning Outcome:	Practicals will give hands on training based on courses ZOC 201, 202, 203 & 204.	
References /Reading:	As mentioned under individual course ZOC 201, 202, 203 & 204.	

Course Code: ZOO 301
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Fishery Biology

Prerequisite for the Course:	Basic knowledge on animal anatomy, physiology and endocrinology	
Objectives:	<p>To understand the various aspects of fisheries.</p> <p>To understand the potentiality of fisheries in India, more particularly in Goa.</p>	
Content	<p>Module1:</p> <p>Fish diversity: Fish Classification and diversity of freshwater and Marine fishes of India.</p> <p>Gas exchange and swimming: Air breathing organs and gas bladder; Swimming modes (fin versus body trunk), swimming muscles and tail beat.</p> <p>Fish Reproduction: Sexual maturity and breeding season of various cultivable species; Development of gametes in male and female; Endocrine control of fish reproduction. Fecundity, Fish egg and embryonic development, Reproductive cycles, reproductive behaviour, parental care and migration.</p>	12 hr
	<p>Module 2:</p> <p>Different Types of culture practices: Monoculture, Monosex culture, Cage culture, Pen culture, and Integrated culture.</p> <p>Culture of Freshwater Indian major carps and ornamental (lacustrine) fish culture; Shell fish culture (prawns) practice and scope in India.</p> <p>Fish diseases, Immune response to pathogens.</p> <p>Management of fish farm/ ponds; Aquatic weeds and their control.</p> <p>Integrated health management of farm.</p> <p>Fish nutrition: Sources of food, feed compositions, Forms of feeds: wet feeds, moist feeds, dry feeds, mash, pelleted feeds, floating and sinking pellets, farm made feeds using local ingredients.</p> <p>Feed storage: Methods of storage and degradation. Use of preservatives and antioxidants in feed. Feed evaluation: Feed Conversion Ratio (FCR); Feed Efficiency Ratio (FER); Protein Efficiency Ratio (PER), Net Protein Utilization (NPU) and Biological Value (BV); Digestive enzymes, feed digestibility; Factors affecting digestibility.</p>	12 hr
	<p>Module 3:</p> <p>Fishery technology and economics: Fishing gears and crafts used in Indian coasts.</p> <p>Fish Industry: Fish preservation, transportation, processing Industries in India.</p> <p>Fishery economics: Status of Indian and global scenario. Major</p>	12 hrs

	pelagic and demersal fisheries of Indian coasts and strategies for its development and conservation. Stock replenishment, Sea ranching and FADs. Fish supply chains and export.	
Pedagogy:	Lectures/ tutorials/assignments/self-study	
Learning Outcome:	1. Understanding the socio-economic development through Fisheries. 2. Acquiring the basic knowledge about the Fisheries as to set entrepreneurship.	
References /Reading	1. Jhingran V, (1982) Fish and Fisheries of India 2 nd Ed (Hind Publication Comp 2. Biswas K P, (1996) A Text Book of Fish, Fisheries and Technology, 2 nd ed. Course Code: ZOO 302

Course Title: Fish Farm Management

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Basic knowledge on animal anatomy, physiology and endocrinology	
Objectives:	To understand the various aspects of fisheries farm management. To understand the potentiality of ornamental fisheries in India, more particularly in Goa	
Content	Module 1: Fin Fish hatchery: Freshwater and marine fish seed resources; Natural breeding of fin fishes; Gears and methods used for seed collection in India, Spawn quality and quantity indices. Bundh breeding: Concept; Wet and dry bundhs; Collection and hatching of eggs; Factors involved in bundh breeding; Advantages and disadvantages of bundh breeding. Breeding and hatchery management: Site selection for the hatchery, Brood-stock collection, transportation and management; Induced breeding of fishes, Synthetic hormones used for induced breeding of carps. Different types of fish hatcheries: traditional, Indian, Chinese, glass jar and modern hatcheries.	12 hrs
	Module 2: Shell fish hatchery: Natural seed resources; collection methods and quality of seeds. Life cycle of important shellfishes: <i>Penaeus monodon</i> , <i>Macrobrachium rosenbergii</i> , <i>P. vannamei</i> , <i>Scylla serrata</i> , lobster, edible oyster; Sexual maturity, size t maturity, breeding behaviour and breeding seasons of different species; fecundity and quality of eggs. Hatchery management of Shellfish: Brood stock collection, transportation and maintenance of shell fishes. Breeding and hatchery management of <i>Penaeus monodon</i> , <i>Macrobrachium rosenbergii</i> ; <i>Scylla serrata</i> , and molluscs. Larval rearing and health management of shellfish: Food and feeding of larval stages of important shellfishes; Health management in hatcheries.	12 hrs
	Module 3: Ornamental fish production: World trade of ornamental fish and export potential; Different varieties of exotic and indigenous ornamental fishes. Culture of marine and brackish water ornamental fishes; Common diseases and their control of ornamental fishes.; Breeding and rearing of ornamental fishes: Brood stock management; Application of genetics and biotechnology for producing quality strains; Management	12 hrs

	<p>practices of ornamental fish farms</p> <p>Setting up of an aquarium: Principles of a balanced aquarium; Fabrication, setting up and maintenance of freshwater and marine aquariums; Water quality management: Water filtration systems: biological, mechanical and chemical. Accessories for the aquarium: Types of filters; Aquarium plants and their propagation methods; Lighting and aeration;</p> <p>Aquarium fish feeds: dry, wet and live feeds. Preparation of aquarium feeds and storage.</p>	
Pedagogy:	Lectures/ tutorials/assignments/self-study	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understanding the scope of ornamental fisheries. 2. Acquiring the basic knowledge about the management of fish farm. 3. To set entrepreneurship in fish farm. 	
References /Reading	<ol style="list-style-type: none"> 1. Dick Mills. (1998). Aquarium fishes, Dorling Kindersly Ltd, London. 2. Jameson, J.D. and Santhanam, R. (1996). Course Code: ZOO 303
 Number of Credits: 3
 Effective from AY: 2020 -21

Course Title: Fish Processing

Prerequisite for the Course:	Basic knowledge on Fish biology, Fishery sciences is prerequisite for this course.	
Objectives:	1. To develop knowledge about post harvest management of fishes. 2. To understand the various aspects of fish preservation and processing	
Content	Module 1: Post Harvest Technology: Principles and importance of fish preservation. Fish spoilage-post mortem changes and rigor mortis, post rigor spoilage. Methods of fish preservation-Icing, Freezing, Cold storage, Drying, Salting, Smoking, Canning and Fish Pickling. Fish product and Byproduct: Fish Oil, Fish liver oil, Fish meal, Fish manure, Fish flour, fish glue and isinglass, chitin	6 hrs
	Module 2: Fish and fishery microbiology: Microflora of aquatic environment. Autotrophic and heterotrophic microorganisms in aquatic environment. Prokaryotic growth – characteristic features of bacterial growth curve – Effect of environmental factors on growth. Nutrition and growth of bacteria – different types of media for isolation of bacteria and fungi. Isolation and cultivation of bacteria and fungi from water and sediment. Health significant bacteria in culture ponds. Culture characteristics and epidemiology of <i>E. coli</i> , pathogenic <i>Vibrio</i> , <i>Salmonella</i> , <i>Aeromonashydrophila</i> , and <i>Pseudomonas</i> . Perishability of seafood – Microbial spoilage of fish and shell fish. Spoilage microflora. Intrinsic and extrinsic factors affecting spoilage. Microflora associated with body parts. Food borne pathogens. Sources of contamination.	6 hrs
	Module 3: Quality Assurance of Fishery Products: Quality control: basic concepts, quality and quality control. Sanitation procedures in seafood processing plants. Waste management in fish processing industries.	3 hrs
	Risk factors in seafood bio toxins, seafood pathogens, endogenous parasites. Methods of evaluating fish freshness and quality – organoleptic, physical, chemical, microbiological and instrumental methods.	3 hrs
	Quality standards in India and major importing countries like USA, Japan and EU. Export of fishery products from India – major countries, important products, export documents and procedures. Traceability, Quality certifications, Eco-labeling.	4 hrs
		4 hrs

Pedagogy:	Lectures/ tutorials/Group discussions/PBL/self-study
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand the basic concepts fish preservation. 2. Identify main microbes concerned with fish processing 3. To Understand the importance of quality control in fish farm
References/ Reading	<ol style="list-style-type: none"> 1. Biswas K.P. (2004). Fish Processing and Preservation. Daya Pub. House. 2. Govindan T.K (1985). Fish Processing Technology. Oxford & IBH Pub. Course Code: ZOO 304

Course Title: Laboratory course on Aquaculture

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Knowledge on Fishery biology and its application or Environmental Physiology	
Objectives:	Laboratory training based on skilled based courses on Fish biology.	
Content	Module 1: 1. Collection of fish pituitary gland and histological studies of pituitary gland. 2. Histological studies of developmental stages of ovary and testes. 3. Study of fish eggs and embryonic developmental stages. 4. Observations on gonadal maturation of prawns. 5. Identification of larval stages of important crustaceans. 6. Identification of common ornamental fishes. 7. Identification of live food organisms	12 x 2 hrs
	Module 2: 1. Culture and maintenance of live feeds such as Artemia and algae 2. Measurement of DO, total hardness and salinity of the water bodies. 3. Preparation of fish feed in laboratory 4. Quality control of fishes: Crude protein analysis of fish muscle by lowry method. 5. Detection of organoleptic changes in fish. 6. Isolation and maintenance of bacteria from fishes. . 7. Gram staining of bacteria.	12 x 2 hrs
	Module 3: Every student must go for the Internship programme for 1 month . DC will select the Institution / Industry with in Goa for the Internship programme at State fishery farm, Private fish farm, Fish processing Industries.	

Course Code: ZOO 305
Number of Credits: 3 credits
Effective from AY: 2020 -21

Course Title: Environmental Physiology

Prerequisite for the Course:	Basic knowledge of Animal Physiology and biochemistry	
Objectives:	1. To learn the meaning of adaptation. 2. To understand how the various physiological processes adjusted during the fluctuation of the various environmental parameters	
Content	Module 1: Nature and levels of adaptation; Mechanism of adaptation; Cellular metabolism, regulation and homeostasis; Concept of stress and strain in animal. Thermal adaptation: structural and functional effects of temperature; Biochemical and physiological effects of temperature; Regulation of heat gain and heat loss, Dubois temperature balance; Role of nervous system and endocrine system in thermal biology; Homeoviscous adaptation of membrane.	6 hrs
	Module 2: Salinity adaptation: biochemical and physiological effects of salinity; Regulation and movements of water and solute; Osmoregulatory organs and their excretory products; Cost and energy of regulation of water and ions. Role of membrane in osmoregulation.	8 hrs
	Module 3: Strategies and mechanism in physiological adaptation with reference to marine life, estuarine life, freshwater life and terrestrial life. Physiological and morphological adaptation of the animals living at extreme environment. Circadian rhythm: Biological clock; Analysis of circadian rhythmicity; Ultradian and infradian rhythm; Behavioural and autonomous rhythm; Endogenous mechanism of rhythm; Homeostasis and circadian rhythmicity	10 hrs
		6 hrs
Pedagogy:	Lectures/ tutorials/self-study	
Learning Outcome:	1. Understanding the concept of adaptation. 2. Understanding the life processes at various environmental condition. 3. Understanding the concept of biological rhythm.	

References /Reading	<ol style="list-style-type: none"> 1. Russel G Foster and Leon Kretzman, (2017) ; Circadian rhythm, A very short Introduction, Oxford University Press, UK 2. Course Code: ZOO 306

Number of Credits: 3

Effective from AY: 2020 -21

Course Title: Neurophysiology

Prerequisite for the Course:	Basic knowledge on Non-chordate and Chordate anatomy and Physiology is prerequisite for this course.	
Objectives:	<ol style="list-style-type: none">1. To develop knowledge about fundamental Neurophysiological concepts in animal models and in humans.2. To be aware of electrophysiology techniques involved in recording neurological parameters.	
Content	Module 1: Review of classification of neurons and their functions. Blood-brain barrier and its physiological importance, CSF composition, formation and drainage. Physiological characteristics of neuronal cell membrane components for impulse conduction. Electrophysiology of neuron. Comparison of action potentials of Giant axon of Squid and mammalian neuron, Voltage and Cell-Patch Clamp Techniques. Myelin ultrastructure and Nodes of Ranvier, Nerve impulse conduction in Myelinated and Unmyelinated neurons. Module 2 Types of synaptic connection and their conduction physiology: Axosomatic, axodendritic, Dendrodendritic and Axoaxonal synapses. Chemical and electrical synapse. Axonal impulse conduction-excitatory and inhibitory synaptic transmission. Properties of Synapse. Effect of Acidosis & Alkalosis, Effect of Hypoxia on Synaptic Transmission, Effect of Narcotic drugs on Synaptic Transmission. Basic concept of Neural integration: Diverging, Converging and Reverberating circuits.	 03Hrs 03 Hrs 04Hrs 02Hrs 03 Hrs 03 Hrs 04 Hrs 02Hrs

	Module 3 Learning and Memory types and its Neural and Cellular basis in Aplysia, Drosophila, Honey bee and Humans. 06 Hrs Cognition and its major domains. Mechanoreception, Photoreception, Chemoreception. 04 Hrs Neurophysiology of Balance and Posture. 02 Hrs	
Pedagogy:	Lectures/ tutorials/Group discussions/PBL/self-study	
Learning Outcome:	1. Understanding of Neurophysiological concepts. 2. Understanding of learning, memory formation and cognition.	
References /Reading	1. Siegel, G. J.; Agranoff, B. W.; Albers, R. W., et al., (2011). Basic Neurochemistry: Molecular, Cellular and Medical Aspects. Academic Press. 2. Hammond, C. (2008). Course Code: ZOO 307

Course Title: Stem Cell Biology

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Basic understanding of cytology, histology and cellular types of embryo and adult.	
Objectives:	<ol style="list-style-type: none">1. Broad awareness of current issues and approaches in stem cell biology,2. Appreciation of the many ways in which stem cell science is utilized in therapeutic contexts.3. A thorough understanding of stem cell science and the molecular nature of pluripotency and differentiation.4. Hands-on experience in several stem cell-related technologies and laboratory practices, including the theory and practice of stem cell propagation and differentiation,	
Content:	<p>Module 1: Basic Biology of stem cells: Introduction to stem cells and basis of stemness; Embryonic stem cells, embryonal carcinoma cells, embryonic germ cells, adult stem cells, hematopoietic stem cells, mesenchymal stem cells, cancer stem cells, induced pluripotent stem cells.</p> <p>Cellular Mechanisms of Stem Cells: Molecular basis of pluripotency, stem cell niche, cell cycle regulators in stem cells, mechanisms of stem cell self-renewal.</p> <p>Module 2: Stem cells isolation and culture: Isolation, characterization and maintenance of embryonic stem cell isolated from: Mouse and Human. Serum and feeder free culture of human embryonic stem cells, evolution of Xeno-free culture systems.</p> <p>Module 3: Applications of stem cells: Neurodegenerative diseases, spinal cord injury, heart disease, diabetes, burns and skin ulcers, muscular dystrophy, orthopedic applications, eye diseases, stem cells and gene therapy. Ethical and regulatory issues in the use of stem cells.</p>	<p>4 hrs</p> <p>8 hrs</p> <p>12 hrs</p> <p>12 hrs</p>
Pedagogy:	Lectures/Tutorials/ PBL/Videos/Assignments/Group Activities/Self-study.	
Learning Outcome:	After successful completion of this course, students will be able to: <ol style="list-style-type: none">1. Describe the characteristics of stem cells and the different types of stem cells.2. Understand the isolation process and cultivation of embryonic stem cells.	

	<ol style="list-style-type: none"> 3. Understand basic biology/mechanisms of pluripotency, self-renewal of stem cells, stem cell niche in regulating stem cell fate, role cell cycle regulators in stem cells. 4. Describe the applications of stem cells in diseases, injury and gene therapy. 5. Appreciate the ethical and regulatory issues associated with use of stem cells.

Course Code: ZO0 308

Course Title: Laboratory course on Life processes

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Knowledge on Neuro-physiology and Stem cell biology.	
Objectives:	Laboratory training based on skilled based courses on Physiology.	
Content	<p>Module 1:</p> <ol style="list-style-type: none">1. Effect of thermal stress on the excretory rates in bivalves.2. Effect of salinity stress on the respiratory rates of bivalves.3. Effect of salinity acclimation in the osmo-regulatory processes of mud crab / tilapia fish.4. Rates of Na^+, K^+ ion transport, $K_m V_{max}$ of Na^+-K^+ ATPase, rates of excretion and rates of respiration).5. Effect of salinity stress on the membrane fluidity of gill epithelial cells of mud crab / tilapia fish.6. Isolation of different parts of brain membrane by sucrose gradient centrifugation and characterization of those isolated membranes7. Estimation of neurotransmitters from fish brain regions (any two neurotransmitters using any two techniques). <p>Module 2:</p> <ol style="list-style-type: none">1. Evaluation of learning and memory experiments using Freshwater Snail or Bivalves or crabs.2. Primary cultures of neurons from chick embryo brains.3. Isolation and Culture of Chicken Cartilage Stem/Progenitor Cells.4. Isolation and Differentiation of Mesenchymal Stem Cells from Broiler Chicken Compact Bones.5. Isolation and maintenance of chicken embryonic stem cell from blastodem.6. Isolation and culture of Dermis-Derived Mesenchymal Stem/Progenitor Cells from chick embryo. <p>Module 3:</p> <p>Every student must go for the Internship programme for 1 month. DC will select the Institution / Industry with in Goa for the Internship programme at Pharma Industries, National as well state laboratories at Various Institute etc.</p>	<p>12 x 2 hrs</p> <p>12 x 2 hrs</p>

Course Code: ZOO 309

Course Title: Ornithology

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Elementary knowledge about Taxonomy and Animal Systematics, Anatomy, Physiology and Ecology of Birds.	
Objectives:	1. This course develops major concepts in ornithology, including Avian Taxonomy and Systematics, Diversity and Identification, Physiology and Ecological aspects of birds and their applications.	
Content	Module 1 Avian morphology, anatomy and physiology: Review of bird as glorified reptile, Avian flight (forms, Mechanism and energetics), Bird vocalization-anatomy of vocal organ, Neurophysiology of song control system, Analysis of bird song using Acoustic spectroscopy, Auditory feedback in birdsong learning, Learning through cultural transmission, The cultural trap hypothesis (Evolutionary preservation of bird vocal learning), Colour physiology of iridescent and non- iridescent feathers and gloss production, types of pigments, thermoregulatory mechanisms, avian eye and its adaptations, Biology of moulting in birds (periodic and forced moulting).	12 hours
	Module 2 Bird identification, systematics and ecology: Fundamental keys of bird identification and Systematics, parameters for molecular taxonomy, Endemism of Indian avifauna, Bird sanctuaries of India, Importance Types of migration, migratory flyways, orientation and navigation, threats to migratory bird population, Nesting success in birds, Comparison of adaptations of Palaeognathae and Neognathae. Ecosystem services provided by birds, Birds as indicators of environmental health, importance of Important Bird Areas.	12 hours
	Module 3 Applied ornithology: Importance of bird population monitoring, Census techniques, Causes of extinction and depletion of bird population of certain species, Conservation of threatened avifauna, Birds as pests in Pisciculture, Apiculture, sericulture and free ranging Poultry farms, Role of birds in dispersal of weeds, parasitic and invasive plants, Birds as vectors of pathogens and parasites, zoonoses, bird strike hazard to aircraft and its management, Bird-watching as an emerging eco-tourism venture, Bio-mimicry and birds in relation to Aerodynamic studies, bionic bird, bullet train inspired by kingfisher, other recent research in ornithology.	12 hours

Pedagogy:	Lectures/Tutorials/Videos/Assignments/Group discussion/Self-study.
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand in detail the various aspects of avian biology such as Taxonomy, their specialized Anatomy, Physiology, Migration, Breeding systems and applications. 2. Identification of birds with the help of field guides which will be helpful for field trips or conducting surveys. 3. Knowledge on the crucial Census methods. 4. Learn about Bird diversity, status and Conservation of Birds.

Course Code: ZOO 310
Number of Credits: 3
Effective from AY: 2020-21

Course Title: Herpetology

Prerequisite for the Course:	Basic knowledge on herpetofauna its identification at taxonomic level and the systematics	
Objectives:	1. Students will be introduced to the diversity and biology of amphibians and “reptiles”. 2. The lecture component will have a global and diverse focus, covering topics of phylogenetics, the origin and evolution of amphibians and reptiles, the global diversity of these taxa, and their biogeography, biology, habitat ecology and conservation .	
Contents:	<p>Module 1: Introduction to herpetology; Shared Characteristics of Amphibians and Reptiles: Significance of studying Amphibians and Reptiles, The diversity of Amphibians and Reptiles, Shared Characteristics of Amphibians and Reptiles: Ectothermal, Thermoregulation and its role, Aestivation, Hibernation and other Eco physiological adaptations, Costs and benefits of Ectothermy and Endothermy, Body size and shape, Ectothermy and efficiency;</p> <p>Amphibians and Reptiles in Terrestrial Ecosystems; Factors affecting distribution and abundance of Amphibian and Reptilian fauna of the Indian subcontinent; Communication in Amphibians and reptiles.</p> <p>Module 2: Systematics and Diversity of Extant Amphibians: Life History, Skin, Reproduction, Sensory systems.</p> <p>Caudata: Salamanders; Morphology, Reproduction and Life History, Fossil Records and Phylogeny of Salamanders.</p> <p>Anura: Frogs and Toads; Skeletal Morphology, Reproduction and Life History, Fossil Records and Phylogeny of Frogs.</p> <p>Gymnophiona: Caecilian’s; Morphology, Reproduction and Life History, Fossil Records and Phylogeny of Caecilian’s.</p> <p>Module 3: Systematics and Diversity of Extant Reptiles: Characteristics of Reptiles; Reptile skin, Sensory system.</p> <p>Lepidosauria: Rhynchocephalia; The Tuatara, Fossil Records. Lepidosauria: General Anatomy of Squamates, Reproduction and Sex determination, Tail Anatomy, Limb reduction, Venom and Venom-delivering structures, Squamate phylogeny, Fossil records.</p> <p>Squamata:Lizards-Systematics and Phylogeny of Lizards,</p>	<p>08 hrs</p> <p>04 hrs</p> <p>03 hrs</p> <p>03 hrs</p> <p>03 hrs</p> <p>03 hrs</p> <p>02 hrs</p> <p>05 hrs</p> <p>01 hrs</p>

	<p>Squamata: Serpentes, the Snakes- Unique morphological features of snakes, Reproduction, Dentition, Fossil record, Systematics and Phylogeny of Snakes;</p> <p>Crocodylia- Fossil record, Systematics and Phylogeny of Crocodylians; Testudines: Turtles- The turtle skeleton, The turtle shell, Locomotion and reproduction, Fossil record, Systematics and Phylogeny of Turtles.</p>	<p>02 hrs</p> <p>03 hrs</p>
Pedagogy:	Lectures/ tutorials/assignments/self-study	
Learning Outcome:	<ol style="list-style-type: none"> 1. Students will learn about the Diversity, Habitat-Ecology, Behavior, Adaptation, Taxonomy of the Amphibian and reptiles. 2. Identification of the local herpetofauna through direct field experience. The course assumes that students are familiar with basic evolutionary theory and general biology.

Course Code: ZOO 311

Course Title: Wildlife Conservation & Management

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Basic knowledge in wildlife conservation and management	
Objectives:	<ol style="list-style-type: none">1. To provide graduates in Biology a specialization in the field of Wildlife Conservation and Management2. To generate qualified students who can directly get jobs in the allied fields of Wildlife Conservation and Management;3. To generate qualified postgraduates who can be part professional/Government organizations working in the field of Wildlife Conservation and Management4. To generate a team of post graduates who can take up jobs related to Wildlife Conservation in the educational institutions.5. To generate a skilled post graduates who can undertake research in the field Wildlife biology.	
Contents:	Module 1: WILDLIFE CONSERVATION AND MANAGEMENT: Introduction to Indian Wildlife, History and Diversity, Biogeographic zones, Value of Wildlife, Important Indian fauna and their distribution, Protected Areas, Endemic species;	06 hrs
	IUCN red list: Extinct species of India, Endangered, Threatened, Least concern and Critically Endangered. Climate change and its impact on wildlife. Impacts of pesticides on fauna.	06 hrs
	Module 2: Environmental Ethics and Management: Conservation and Management of Wildlife: Conservation and management: In-situ conservation and Ex-situ conservation; Reintroduction, Ecological Restoration.	03 hrs
	Innovative Methods in Wildlife: Camera Trap, Conservation Drones, Remote Sensing, Radio Telemetry, GIS, GPS Mobile App, Capturing and marking techniques, trapping, darting, tagging and banding, scat analysis, sign survey's.	05 hrs
	Wildlife Census and Indices: Methods of animal census, counting methods. Animals in Indian Mythology. Major Projects. Ecotourism and Environment Impact Assessment	04 hrs
	Module 3: Human Wildlife Conflict: Types of conflict, Prevention or	04 hrs

	<p>precautions, Human Elephant Conflict, Conflict between human, Tiger and Leopard, Conflict with Sloth Bear.</p> <p>Wildlife Trade and Crime: Wildlife products CITES, TRAFFIC, Wildlife Crime Control Bureau in India, Wildlife Forensic.</p> <p>Law, Ministry and Organizations: Wildlife Protection Act of (1972), National Board of Wildlife, Environment Protection Act (1986), Biological Diversity Act (2002), The First National Wildlife Action Plan (NWAP) (1983), National Wildlife Action Plan (2017-2031), MoEFCC,</p> <p>International organizations; UNESCO, IUCN, PETA. National Institutes/Organizations; NTCA, ZSI, BSI, CZA, WII, SACONH, ENVIS. Non-Government Organizations.</p>	<p>02 hrs</p> <p>04 hrs</p> <p>02 hrs</p>
Pedagogy:	Lectures/ tutorials/assignments/self-study	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand the distribution and diversity of Indian wildlife including their conservation status. 2. Gain insight on the different methods and techniques in wildlife conservation 3. Will gain practical knowledge on wildlife management and conservation 4. Understanding towards implementation of different wildlife projects including various laws, acts and regulations for the conservation of wildlife.

Course Code: ZOO 312

Course Title: Laboratory course on Field Biology

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Knowledge on Fishery biology and its application or Environmental Physiology / Neuro-physiology and Stem cell biology or Biodiversity along with Wild life management and Herpetology.	
Objectives:	Laboratory training based on skilled based courses on Fish biology, Physiology and Biodiversity.	
Content	<p>Module 1:</p> <ol style="list-style-type: none">1. Study of Bird Census techniques in field-Transect, point count and call count methods.2. Ornithological statistical analysis of field identified birds based on their colour, size, flight, calls and nest building.3. Comparative study of avian fauna with respect to habitat variation (Plateau, Forest and Wetland)4. Acoustic analysis of Bird calls and songs.5. Study of flight muscles of Chicken used in any study area.6. The identification of the amphibian and reptile families through basic external anatomy7. Identification through scale count <p>Module 2:</p> <ol style="list-style-type: none">1. Learning handling techniques of Amphibians and Reptiles2. Beta diversity of herpetofauna in the Goa University campus3. Mammal distribution of Goa (i) Primates: Rhesus macaque (ii) Carnivores: Tiger, Panther, Sloth bear (iii) Ungulates: Sambar, Chital, Wild boar.4. Horn/ Antler identification.5. Call Identification of common birds – any five birds6. Pugmark analysis and Camera trap methods.7. Animal Scat, pellet, dung, droppings analysis (Indirect evidences)8. Case study of Man-Animal conflict and Ethnozoology. Visit to Zoo/Wildlife Sanctuary/National Park/Turtle nesting site <p>Module 3:</p> <p>Every student must go for the Internship programme for 1 month. DC will select the Institution / Industry with in Goa for the Internship programme at Biodiversity Board, Forest Department.</p>	12 x 2 hrs

Course Code: ZOO 313
Number of Credits: 3+ 1
Effective from AY: 2020 -21

Course Title: Toxicology

Prerequisite for the Course:	Basic knowledge on Anatomy, Physiology and Ecology.	
Objectives:	<ol style="list-style-type: none"> 1. To understand everyday toxic substances and their routes of exposures and its fate in the animal body and in the environment. 2. To understand significance of toxicological studies in forensic science. 	
Content:	<p>Module 1 Introduction to toxicology: Definition and Scope, History of Toxicology, Branches of Toxicology. Classification of Toxicants (based on 1] Source, 2] Use, 3] Target organ 4] Reactivity). Toxicokinetics: Definitions and concepts of Exposure, Dose and response. Metabolism of toxicants (Phase I and Phase II reactions), Absorption, Distribution, Biotransformation and Elimination of Toxicants (Renal Elimination, Hepatic Elimination, Respiratory Elimination), Toxic actions /mechanism (Acute, Sub-chronic & Chronic). Toxicokinetic models (Descriptive and Physiological Models).</p> <p>Module 2: Environmental Toxicity: Environmental contaminants, Dilution paradigm and Boomerang paradigm, Ways of poisoning food chain, Environmental persistence. Pollution: Air pollution, Noise pollution, water pollution and thermal pollution: types and sources, effects of pollutants on human health. Solid waste pollution: sources and effects of solid waste toxicity on human health. Pesticide and Heavy metal toxicity: effects of pesticides and heavy metals on ecosystem, mechanism of pesticides toxicity, heavy metal toxicity and their effects on human health</p> <p>Module 3 Forensic toxicology: Disciplines of Forensic toxicology (Definition of poisons, Forensic classification of poison, factors affecting the mode of action of poisons, extraction and isolation of poisons from biological samples. Drugs included in routine post-mortem toxicology, Forensic DNA typing system. Applications of forensic toxicology Alkaloid toxicity: definition, classification and isolation of alkaloids from biological samples, general properties of toxic alkaloids. Food poisoning- definition and common sources. Analysis of Milk and milk products for adulterants by physical, chemical and instrumental techniques.</p> <p>Module 4: Practicals Determination of alcohol in blood and urine sample.</p>	<p>4Hrs</p> <p>8 Hrs</p> <p>4 Hrs</p> <p>4 Hrs</p> <p>4 Hrs</p> <p>6Hr</p> <p>3 Hrs</p> <p>3 Hrs</p> <p>12 x 2 Hrs</p>

	<p>Determination of barbiturate by UV -visible Spectrophotometric method.</p> <p>Extraction of drugs from hair sample.</p> <p>Determination of a drug in urine by visible / UV Spectrophotometry</p> <p>Determination of LD50 from given data using Probit analysis.</p> <p><i>In Vitro</i> Cytotoxicity test using XTT/MTT assays and cell cultures.</p> <p>Effect of heavy metal pollution in the osmoregulatory process in crabs/fishes</p>	
Pedagogy:	Lectures/Tutorials/Videos/Assignments/ Group discussions/Self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understanding the significance of toxicology and to distinguish the different toxic materials. 2. Understanding application of different routes of exposure for toxicological studies and dose findings. 3. Understanding of the physiological and environmental effects of toxins. 4. Knowledge of various techniques for Toxicity evaluation.

Course Code: ZOO 314
Number of Credits: 3 + 1
Effective from AY: 2020 -21

Course Title: Advanced Cell Biology

Prerequisite for the Course:	Basic understanding of different components and functions of the cell.	
Objectives:	<p>3. To develop advanced concepts of structural and functional properties of cell and its components.</p> <p>4. To understand dynamic functions associated with cell membrane and organelles.</p>	
Content	<p>Module 1 Cell membrane: Plasmamembrane Dynamics involved in Membrain fluidity (Paracrystalline state, Liquid-disordered state and Liquid-ordered state), Transbilayer movements, lateral movements, Membrane Rafts, Caveolins, cell-cell interaction, membrane fusions. Importance of Freeze-fracture microscopy and Fluorophore Photobleaching experiments to decipher membrane structure and dynamism. Nuclear transport: Passive Transport and selective energy dependant transport, Karyopherins (Importins and exportins), NLS and NES</p> <p>Module 2 Endomembrane system: Main Vesicular transport pathways (inward transport: Endocytotic pathway and Outward Transport: Secretory pathway) of endomembrane systems and transport proteins involved. Structural and functional Polarization of Golgi apparatus, Two models for cis to trans-Golgi progression (Cisternal Maturation Model and Vesicular transport model, three pathways of protein sorting at trans Golgi network: Signal mediated diversion to Lysosomes, Signal mediated diversion to regulated secretion, constitutive secretory pathways. LAMP and LIMP of Lysosomes and their significance. Synthesis, Structure and Functions of Ribosome and its subunits in Prokaryotes and Eukaryotes. Concept of LUCA in relation to Ribosomes.</p> <p>Module 3 Comparison of constitution of Cytoplasm, Cytosol and Nucleoplasm. Comparison of Organelle composition of Protein secreting and Steroid secreting Cells. Comparison of Cytoskeletal elements of Prokaryotes and Eukaryotes. Programmed and non-programmed Cell death and its types, Autophagy, Pyroptosis, Necroptosis, Parthoantos, Ferroptosis, Apoptosis and Necrosis. Extrinsic <i>versus</i> Intrinsic pathway of</p>	<p>07 hrs.</p> <p>02 Hrs</p> <p>03 Hrs</p> <p>04 Hrs</p> <p>06 hrs</p> <p>02 Hrs</p> <p>03 Hrs</p> <p>04Hrs</p>

Course Code: ZOO 401
Number of Credits: 3
Effective from AY: 2020 -21

Course Title: Animal Genetics

Prerequisite for the Course:	Basic knowledge of classical genetics and fundamental aspects of genetics.	
Objectives:	1. To develop concepts in classical animal genetics and their application. It leads to a better understanding of human genetic profile and the related diseases. 2. To relate the genetic concepts and the basic principles to produce better breeds of animals which can benefit economically. This course also aids in gaining better knowledge of novel aspects of Genetics and Bioinformatics.	
Content:	Module 1: Chromosomal Genetics: Chromosomal basis of inheritance and Cytological basis of crossing over- Sterns experiments in <i>Drosophila</i> , Inheritance of linked genes -Coupling and Repulsion phase, differential chromosomal staining techniques.	4 hrs
	Mapping genomes: a) Genetic mapping – DNA markers - RFLPs, SSLPs, SNPs b) Physical mapping - Restriction mapping, Fluorescent in situ hybridization, Radiation hybrid mapping and Sequence tagged site mapping, gene mapping in <i>Drosophila</i> using two point and three point test crosses with an emphasis on interference and coefficient of coincidence.	6 hrs
	Genetic models: Mouse as a model mammal for genetic studies, other animal models for human diseases.	2 hrs
	Module 2: Review of Pedigree analysis: Autosomal recessive disorders, Autosomal dominant disorders, X-linked recessive disorders, X-linked dominant disorders, Y-linked disorders (two examples each).	6 hrs
	Bioinformatics: tools and application in genetic studies. Cancer Genetics: Introduction and cellular aspects; Proto-oncogenes; Oncogenes; Viruses and Cancer; Oncoproteins; Tumor suppressor genes; Inherited Cancer genes (Familial Cancers).	6 hrs
	Module 3: Genetic applications in Fishes, Livestock and Wildlife: Evaluation and characterization of various indigenous breeds of fishes, livestock and poultry. <i>Ex-situ</i> and <i>In-situ</i> conservation of animal and poultry genetic resources.	6 hrs
		3 hrs

	<p>Role of artificial insemination / frozen semen / embryo transfer / ONBS / MOET technology in animal breeding.</p> <p>Gene editing in livestock: Promise, prospects and policy. Knock-out animals, Conditional knock outs using cre-loxP recombination; tissue specific promoters.</p>	3 hrs
Pedagogy:	Lectures/Tutorials/Videos/Assignments/Group Activities/Self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand Classical genetics and learn about microbial genetics and the related use of the concept in laboratories. 2. Learn about Drosophila genetics to study genetic principles using the model of Drosophila 3. Study the lesser known field of epigenetics 4. Knowledge on cancer and inherited genetics. 5. Distinguish between structural, functional and comparative genomics and how they differ from proteomics. 6. Evaluation of the various techniques used in advanced genetic analysis. 7. Learn about the novel field of Bioinformatics.

Course Code: ZOO 402

Course Title: Biodiversity

Number of Credits: 3

Effective from AY: 2020 -21

Prerequisite for the Course:	Should have studied B. Sc. Zoology with assumption that the student has a basic working knowledge of classical faunal biological diversity.	
Objectives:	<ol style="list-style-type: none"> 1. To provide graduates in Biology a specialization in the field of Biodiversity and Conservation. 2. To generate qualified postgraduates who can be part professional organizations working in the field of conservation and environment protection. 3. To provide an alternate avenue to Biology graduates to specialize as “environmental entrepreneurs” in areas such as Environmental audits, Environmental education, Ecotourism etc. 4. To create awareness about Biodiversity and Nature Conservation. 	
Content:	Module 1: Introduction: Measuring Biological Diversity, Measuring global biodiversity and its decline with special reference to Mammals, Avifauna, Herpetofauna, Ichthyofauna, Malacofauna and Insects, Keystone species, Geographic Distribution of Biological Diversity, Gradients of Spatial Distribution, Endemism and biodiversity	12 hrs
	Module 2: Biodiversity and Ecosystem function <ol style="list-style-type: none"> (a) Theories on relation between biodiversity and ecosystem function <ol style="list-style-type: none"> i. Species Complementarity ii. Sampling effect iii. Redundancy (b) Decline of global biodiversity and loss of Ecosystem function. (c) Functional diversity and ecosystem functioning. (d) Insurance Hypothesis: The effect of habitat fragmentation and dispersal on ecosystem functioning. (e) Biodiversity and stability in soil ecosystem: pattern processes and the effect of disturbance. (f) Global pollinator loss and their effect on crop production and non-crop plant reproduction. (g) Multi-trophic dynamics and ecosystem processes. (h) The economics of biodiversity and ecosystem function. 	04 hrs
	Module 3: Type of Diversity: Alfa, Beta and Gama diversity; Indices: Shannon Index, Simpson Index, Lincoln Index, Dominance index, Margalef richness index, Menhinick Index, Equitability Index, Whitaker Index, Sorensen’s Index, Jaccard Index, Brillouin Index,	08 hrs
	Legal framework of biodiversity conservation Introduction to laws and policies for biodiversity conservation: Convention on Biological	03 hrs

	<p>Diversity, Kyoto protocol, Nagoya Protocol, Ramsar Convention on conservation of wetlands, Forest Conservation Act of India (1927), Environment Protection Act of India (1986).</p> <p>Indian Biodiversity law and rules, State Biodiversity rules: Bio prospecting and conservation, IPR, patent protection and biopiracy. Tradable bio-resources, biodiversity informatics, databases in biological materials. International efforts and issues of sustainability</p> <p>Organisations involved in biodiversity conservation: World conservation Union, National Biodiversity Authority, State Biodiversity Boards, Biodiversity Management Committees and Peoples Biodiversity Register.</p>	<p>03 hrs</p> <p>03 hrs</p>
Pedagogy:	Lectures/Tutorials/Videos/Assignments/Group Activities/Self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Learner will understand the concept and components of biodiversity, its importance. 2. Realise the role of human population Vs biodiversity. 3. Will have sufficient knowledge on wild life and its conservation. 4. Will realise the national and international efforts to protect and propagate biodiversity, Bioprospecting, IPR, biopiracy etc. 5. Utilizing skills for preparation of PBR and can actively participate in conservation.

Course Code: ZOO- 403
Number of Credits: 2
Effective from AY: 2020 -21

Course Title: Evolutionary Biology

Prerequisite for the Course:	Basic working knowledge of diversity, cell biology, genetics and classical evolutionary biology.	
Objectives:	This course develops major concepts in evolutionary biology, including theories, unicellular/multicellular evolution, evolutionary history and evolutionary time scale. This course also provides a better understanding of population genetics, evolutionary forces and speciation. Additionally, this course throws light on aspects of molecular evolution along with evolutionary models.	
Content	<p>Module 1: Emergence of evolutionary thoughts, Evolutionary theories and evidences: Contributions of Lamarck, Darwin, Darwin-Wallace postulates, concepts of variation, adaptation, struggle, fitness and natural selection; Spontaneity of mutations; The evolutionary synthesis, limitations of Darwinism, Neo Darwinism.</p> <p>Origin of cells and unicellular evolution: Origin of basic biological molecules, Abiotic synthesis of organic monomers and polymers, Concept of Oparin and Haldane, Experiment of Miller (1953), The first cell, Evolution of prokaryotes, Origin of eukaryotic cells, Evolution of unicellular eukaryotes.</p> <p>Paleontology and Evolutionary History: Overview of evidences - Paleontological, Embryological, Comparative morphological, Anatomical, Genetics and Cytological, Molecular Biological evidences.</p> <p>The Evolutionary time scale: Eras, periods and epoch; Major events in the evolutionary time scale; Origins of unicellular and multi cellular organisms; Major groups of plants and animals; Stages in primate evolution including Homo, Human evolution.</p> <p>Module 2 Population genetics: Populations, Gene pool, Gene frequency; Hardy-Weinberg Law; Evolutionary forces that affect the allelic frequencies: Mutation, Migration, Selection - Stabilizing selection, Directional selection, disruptive selection, Balancing selection, Frequency dependent selection, Density dependent selection, Group and kin selection, Selection coefficient, Selective value, Selection in natural Populations, Genetic drift, Nonrandom mating.</p>	<p>3 hrs</p> <p>3 hrs</p> <p>2 hrs</p> <p>4 hrs</p> <p>4 hrs</p>

	<p>Hybridization and speciation: Concept of species and models of speciation based on distribution sympatric, allopatric, stasipatric, genetic drift, genetic revolution, genetic transilience, Founder-flush theory, phylogenetic gradualism, punctuated equilibrium, hybridization, adaptive radiation, isolating mechanisms.</p> <p>Molecular Evolution: Molecular phylogeny, neutral theory, molecular clock.</p> <p>Creation and evolution models.</p>	<p>3 hrs</p> <p>3 hrs</p>
Pedagogy:	Lectures/Tutorials/Videos/Assignments/Group discussion/Self-study.	
Learning Outcome:	<ol style="list-style-type: none"> 1. Understand in detail the various concepts of evolutionary biology such as theories, history and evidences. 2. Study the time scale and understand stages of life formation and evolution. 3. Learn about the intricacies of population genetics in evolution. 4. Understand the various processes related to evolution. 5. Knowledge about molecular evolution, the field that links various aspects in zoology.

Course Code: ZOO-404
Number of Credits: 2
Effective from AY: 2020 -21

Course Title: Endocrinology

Prerequisite for the Course:	Basic knowledge on animal anatomy, physiology and endocrinology.	
Objectives:	This course develops concepts in molecular level endocrinological events to understand hormones and their crucial role in the animal body. This course also focuses on various approaches to understand hormone action and the receptors involved. Additionally this course reflects on the endocrine glands and the related applications of hormones in the field of cellular pathologies.	
Content:	<p>Module1: Classification of hormones, structure-function relationships in different hormones, transcriptional and post-transcriptional mechanisms of hormone biosynthesis and secretion, regulation of biosynthesis and secretion, inhibitors of hormone biosynthesis and their use, purification and storage of hormones.</p> <p>Nature of hormone receptors; receptors and types- membrane receptors, nuclear receptors; receptor antagonists and their applications, structural requirements for successful hormone-receptor interactions.</p> <p>Nature and mechanism of hormone action, signal discrimination, signal transduction pathways, secondary messengers, signal amplification, molecular mechanisms of regulation, permissive actions of hormones, signal attenuation, termination of hormone action, cross talk between steroid and protein hormone pathways.</p> <p>Module 2: Techniques for quantization of hormones, design and development of hormonal assays.</p> <p>Hormones and diseases, Genetic analysis and clinical management of hormonal disorders.</p> <p>Hormones as therapeutic agents, current developments in design and production of hormonal contraceptives, recombinant protein hormones-production and applications, evolution of chemical communication in animal systems.</p>	<p>4 hrs</p> <p>4 hrs</p> <p>4 hrs</p> <p>3 hrs</p> <p>3 hrs</p> <p>4 hrs</p>
Pedagogy:	Lectures/Tutorials/Videos/Assignments/ Group discussions/Self-study.	

Learning Outcome:	<ol style="list-style-type: none"> 1. Essential in depth understanding of the various hormones, molecular synthesis, secretion, receptors and action of hormones along with regulation. 2. Vision to understand the endocrine glands with the crucial functioning in the body and the various hormone base disorders with new age aspects of hormones and applications to other fields of cell biology.

Course Code: ZOO 405
Number of Credits: 2
Effective from AY: 2020 -21

Course Title: Biostatistics

Prerequisite for the Course:	Elementary knowledge of statistical approaches	
Objectives:	<ol style="list-style-type: none"> 1. To understand fundamental concepts and techniques of descriptive and inferential statistics with applications in lifesciences. 2. To understand the principles of various study designs, and explain their advantages and limitations. 	
Content:	Module 1: Introduction to Biostatistics, Population and samples, Sampling Types, Types of Variables, Difference between Primary and Secondary Data, Data representation, Type I and II Errors, Experimental/Study designs and its types, statistical inferences and Hypothesis Testing, Meaning of statistical Significance, Pre and Post-Hoc tests. Differences between descriptive and Inferential statistics.	12 hrs
	Module 2: Data representation and plotting, Mean, Measure of Variability, Standard deviation, Kurtosis, R programming, Correlation, Regression, Interpolation and extrapolation, Concept of Probability, Variance and Covariance, Probability distributions, Test of Hypothesis (1 tailed and 2 tailed Test of Hypothesis, p-value, (Type -1 and Type -2 error), . T-test, 1 tailed and 2 tailed T-distribution, Chi-square test, ANOVA.	12 hrs
Pedagogy:	Lectures/Tutorials/ PBL/Videos/Assignments/Group Activities/Self-study.	
Learning Outcome:	After successful completion of this course, students will be able to: <ol style="list-style-type: none"> 1. Understand the role of biostatistics in biological studies. 2. Use descriptive tools to summarize and display data from biological studies. 3. Identify appropriate tests to perform hypothesis testing, and interpret the outputs adequately. 4. Get familiar with statistical software and standard packages for biostatistics.

Course Code: ZOO-406

Course Title: Vector Biology

Number of Credits: 2

Effective from AY: 2020 -21

Prerequisite for the Course:	Basic working knowledge of taxonomy, biodiversity, arthropodology.	
Objectives:	This course will help the learner to understand the all concept and components of arthropods, in depth, involved in causing diseases. Additionally this course also covers the field of modern vector biology, giving an exposure to the emerging subjects like Proteomics. Moreover the course also deals with vector and disease control and focuses on common mosquito linked diseases.	
Content	<p>Module 1 Introduction to vector biology and its importance in public health management. Arthropod as disease vectors, taxonomy, classification, biology, ecology. Arthropod transmitting bacteria and viruses of medical importance; Major vector borne diseases; Vector-parasite interaction; Host-pathogen interaction; Factor in disease transmission. Special reference to mosquitoes as vectors, Biology, Bio-ecology, Life history of Anopheles, Culex, and Aedes mosquitoes, malaria, filariasis, dengue, Chikungunya and Japanese encephalitis.</p> <p>Module 2 General Characters and classification, history, distribution, morphology, biology, life cycle, mode of infection, signs and symptoms, diagnosis, molecular biology, drug resistance, treatment, preventive measures and control of: Flies, Bugs, Fleas And Lice. Modern vector biology; Genomics and Proteogeomics of vectors. Chemical and biological and environmental control of vectors; Integrated vector management, vector resistance mechanism.</p>	<p>1 hr</p> <p>2 hrs</p> <p>6 hours</p> <p>3 hrs</p> <p>6 hrs</p> <p>6 hrs</p>
Pedagogy:	Lectures/Tutorials/Videos/Assignments/Group discussion/Self-study.	
Learning Outcome:	<ol style="list-style-type: none">1. Learner will understand the concept and components of vectors, their behavior, taxonomy, morphology, life cycle and entire biology.2. Understand insects as parasites and the various linked diseases.3. Sufficient knowledge of modern vector biology and proteogeomics.4. Know about vector control and integrated vector management.5. Create and communicate knowledge on the causes and prevention of vector borne disease in the population, to promote health and health services.6. Learn about mosquito linked diseases.

Course Title: Histology and Histochemistry

Number of Credits: 2

Effective from AY: 2020 -21

Prerequisite for the Course:	Elementary knowledge of Cell Biology and Physiology.	
Objectives:	3. To study the microscopic organization of cells into tissues. 4. To understand the microscopic structure of tissues; their cellular function and physiological relevance.	
Content:	Module 1: Introduction to Histology, types of Epithelia, Histology of Brain, Spinal cord, Heart, Liver, Kidney, Digestive tract, Bones. Histological Techniques, Tissue fixatives, Processing of tissue, Microtomy, Cryotomy, Staining Principles, Mounting media, Types of Microscopy, Image capture tools, analysis and interpretations. Module 2: Principles of histochemistry and cytochemistry, detection techniques of carbohydrates, lipid, and nucleic acid, proteins, hydrolytic and oxidative enzymes, inhibitors and calcium. Cytochemical detection techniques and its principles; Principles and techniques of autoradiography, cytophotometry; Principles of Histopathology techniques and its application.	6 hrs 6 hrs 6 hrs 6 hrs
Pedagogy:	Lectures/Tutorials/ PBL/Videos/Assignments/Group Activities/Self-study.	
Learning Outcome:	After successful completion of this course, students will be able to: 1. To examine images of a tissue section and identify the types of tissues present, their roles, and the relationship between structure and function

Course Code: ZOO- 408
 Number of Credits: 2
 Effective from AY: 2020 -21

Course Title: Helminthology

Prerequisite for the Course:	Basic working knowledge of animal parasites, their morphology and biology.	
Objectives:	This course will help the learner to understand the subject of parasitology, host-parasitic interaction, various Helminthes, i.e Nematodes, Trematodes and Cestodes along with their entire biology and human immune responses. This course also aids in developing knowledge about helminthes of veterinary importance.	
Content	Module 1 Introduction to Helminthology: General organization and Classification of Platyhelminthes and Aschelminthes; Functional anatomy of Reproductive system of Nematodes, Trematodes, Cestodes Intramolluscan stages and their effect on molluscan hosts, Effect on foot, haepatopancreas, Reproductive system and general metabolism. 2. Various types of Cercaria. 3. Different types of larvae in cestodes and their pathogenicity. 4. Holdfast organs with its adaptations in cestodes.	06 hrs
	Basic concept and overview - Parasite relationship, Parasitic adaptations, interrelationships between host and parasite. Host Parasitic interactions in health and diseases. Signs and symptoms of parasitic diseases. Immune response and self-defense mechanisms, immune evasion and biochemical adaptations of parasites. Helminths of veterinary importance.	06 hrs
	Module 2: Life cycle, mode of infection, signs and symptoms, diagnosis, molecular biology, drug resistance, treatment, preventive measures and control of each of the following:	
	Nematodes: Intestinal (<i>Ascaris lumbricoids</i> , <i>Trichinella spiralis</i> , <i>Ancylostoma duodenale</i> , <i>Necator americanus</i>), Blood and tissue nematodes (<i>Wuchereria bancrofti</i> , <i>Dracunculus medinensis</i>).	03 hrs
	Trematodes: Liver fluke (<i>Fasciola hepatica</i>), Intestinal Fluke (<i>Fasciolopsis buski</i>), Lung flukes (<i>Paragonimus westermani</i>), Blood flukes (Schistosomes); Cestodes: (<i>Taenia solium</i> , <i>Dipylidium caninum</i>), Extra- Intestinal larval Cestodes (<i>Echinococcus spp.</i>)	03 hrs
Pedagogy:	Lectures/Tutorials/Videos/Assignments/Group discussion/Self-study.	

Learning Outcome:	<ol style="list-style-type: none"> 1. Learner will have sufficient knowledge on parasitology. 2. Will understand host-parasitic interaction. 3. Will realize various helminths and their biology. 4. Develop concept in understanding parasites and impact on lives. 5. Highlights the parasites of veterinary importance.

Course Code: ZOO 409
Number of Credits: 02
Effective from AY: 2020 -21

Course Title: Ethology

Prerequisite for the Course:	Basic knowledge of animal science and behaviour.	
Objectives:	This course develops concepts in the behaviour of animals such as underlying genetic and molecular mechanisms of behaviour as well as its importance in the animal kingdom	
Content:	<p>Module 1 Introduction to Ethology :Social Behaviour:Parental care- Types, parent offspring conflict, Sexual strategies, mating types and Courtship, Aggression and territory Communication in animals:Auditory, Echolocation, Infra and ultra sounds, Tactile, Visual, Pheromones- in vertebrates and invertebrates, Language of honey bees-circle and waggle dance Feeding strategies: Heterotrophs, Parasitic, Saprophytes, Commensalism, mutualism, Coprophagy and Hematophagy</p> <p>Module 2: Learning and Imprinting: Introduction and definitions, Habituation, conditioning. Trial and error, Imprinting, Neural mechanism of learning. Socio-biology: Introduction- definition, WO Wilson, Richard Dawkins, WD Hamilton, Units of Socio-biology. Hamilton's theory and Altruism, cooperation, reciprocation and Eusociality. Jane Goodall, Dian Fossey; Properties, advantages of a social group, Social organisation in primates.</p>	<p>04 hrs</p> <p>04 hrs</p> <p>04 hrs</p> <p>04 hrs</p> <p>08 hrs</p>
Pedagogy:	Lectures/ tutorials/assignments/self-study	
Learning Outcome:	1. Understand the genetic and molecular mechanisms underlying behaviour. 2. Gain insight on the different types of behaviours used for survival in the animal kingdom	
References /Reading	1. Alcock, J, Animal Behavior, Sunderland Sinauer Associates 2. Bonner JT, Evolution of Culture in Animals, Princeton Univ Press. New Jersey 3. Course Code: ZOO 410

Course Title: Biological Techniques

Number of Credits: 2

Effective from AY: 2020 -21

Prerequisite for the Course:	Elementary knowledge of Physics, Chemistry besides Lifescience.	
Objectives:	<ol style="list-style-type: none">1. To provide knowledge on physical and chemical principles involved in the laboratory instruments used for preparative and analytical biological methods.2. To provide general overview of different biochemical experimental approaches to understand the structure and functions of cell and its components.	
Content	Module 1 Spectrophotometry techniques: Laws of radiant energy absorption, Radiant energy resources, Wavelength selectors, Sample containers, Detection devices, amplification and readout, Qualitative and quantitative applications. Molecular biology techniques: PCR and RT-PCR, working principles, data analysis, applications. Microscopic techniques: Visualization of cells and subcellular components by light microscopy, resolving powers of different microscopes, microscopy of living cells, scanning and transmission microscopes, Freeze-etch and Freeze-fracture methods for EM, image processing methods in microscopy. Radiolabeling techniques: Detection and measurement of different types of radioisotopes normally used in biology, incorporation of radioisotopes in biological tissues and cells, molecular imaging of radioactive material, safety guidelines. Module 2 Chromatography techniques: Principle of chromatographic separations, Types of chromatographic techniques, Planar, Column, Thin layer, Displacement, Ion-exchange, Size exclusion, Gas and Liquid Chromatography (their working and application). Electrophoresis techniques: Concepts of Electrophoresis and Electro-osmosis; Slab Gel and Vertical gel assemblies, Agarose gel electrophoresis, PAGE, SDS-PAGE, Isoelectric focusing, 2D Gel electrophoresis, Recovery of materials from Electrophoretic gels. Centrifugation techniques: Types by rotor designs, Types by intended use, Centrifugal techniques (Differential, Density gradient, Rate Zonal, Isopycnic centrifugation).	03Hrs 03 Hrs 03 Hrs 03 Hrs 05 Hrs 04Hrs 03Hrs
Pedagogy:	Lectures/ tutorials/Group discussions/PBL/self-study	
Learning Outcome:	<ol style="list-style-type: none">1. Understanding the basic knowledge of some advance techniques and their uses and its potential application in animal biology.	
References /Reading	<ol style="list-style-type: none">1. Cooper TG (1977), The Tools of Biochemistry, John Wiley publication, India.

--	---

Course Code: ZOO-411 **Course Title: Bioinformatics: Introduction to Biological Databases**
Number of Credits: 2
Effective from AY: 2020 -21

Prerequisite for the Course:	Basic knowledge of Cell and Molecular biology, Genetics.	
Objectives:	1. To expose students to this subject and modern technology. 2. To make students understand fundamental principles of bio informatics for an in depth understanding of the related subjects. 3. Application of this novel field in Zoology and use of this subject with respect to Evolutionary significance.	
Content:	<p>Module1: Bioinformatics- Introduction and definition, History and Scope, Applications of Bioinformatics in various fields.</p> <p>Nucleic Acid Sequence Databases :</p> <ul style="list-style-type: none"> • Nucleic acid sequence databases (GenBank, EMBL, DDBJ), Keyword-based search at Entrez Search Engine at NCBI. • Sequence Submission tools at NCBI, EMBL etc. <p>Protein sequence database: UniProtKB (SwissPort, TrEMBL). Species specific database for mouse and zebra fish Metabolic pathway databases.</p> <p>Open Access Bibliographic Resources and Literature Databases:</p> <ul style="list-style-type: none"> • PubMed, • MEDLINE, • PubMedCentral at NCBI <p>Module 2 Sequence Analysis: Various File Formats for Biomolecular Sequences:</p> <ul style="list-style-type: none"> • GenBank • FASTA <p>Basic concepts of sequence analysis:</p> <ul style="list-style-type: none"> • Global Pair wise Sequence Alignment • Local Pair wise Sequence Alignment • Needleman and Wunsch, Smith and Waterman algorithms for pair wise alignments, gap penalties, use of pair wise alignments for analysis of Nucleic acid and Protein sequences and interpretation of results. <p>Databases Searches :</p> <ul style="list-style-type: none"> • BLAST • FASTA <p>Multiple Sequence Alignment:</p>	<p>1 hr</p> <p>8 hrs</p> <p>3 hrs</p> <p>7 hrs</p> <p>5 hrs</p>

	<ul style="list-style-type: none"> • The need for MSA • Basic concepts of various approaches for MSA (e.g. progressive, hierarchical, iterative etc.). <p>Concept of Phylogeny:</p> <ul style="list-style-type: none"> • Molecular Phylogeny • Various Methods of Phylogenetic Tree Construction <p>Scoring matrices: Basic concept of a scoring matrix, Matrices for nucleic acid and proteins sequences, PAM and BLOSSUM series.</p>	
Pedagogy:	Lectures/ tutorials/online teaching mode/self-study.	
Learning Outcome:	<p>The students will acquire the knowledge about:</p> <ol style="list-style-type: none"> 1. Various bioinformatics tools and techniques and how to use that for the analysis of the biological experimental data. 2. Concepts of various databases and various methods for the data retrieval, data storage, and data mining and use that data for the further analysis. 3. In-Silico approach for the protein modeling and drug discovery process. 4. Sequencing techniques and gene annotation as well as submission of the sequences to the various databases.

Course Title: Scientific Communication

Number of Credits: 2

Effective from AY: 2020 -21

Prerequisite for the Course:	Elementary knowledge of Cell Biology and Physiology.	
Objectives:	To develop successful Science Writing in students to demonstrate their ability to understand and use of available knowledge in science.	
Content:	Module 1 Making Oral presentation: Pronunciation, accent, intonation, clarity, speed, fluency; eye contact; planning and organization.	3 hrs
	Enrichment of Vocabulary: word forms and derivation, prefixes and suffixes, Scientific and technical vocabulary, spelling.	
	Basic grammar: Tenses; Voices; Proposition and conjunctions; conditional sentences; Punctuations. Softwares for Plagiarism Check and Grammar, Softwares for Reference styles and manuscript organization.	3 hrs
	Effective writing presentation: Order of sentences in a paragraph, Sentence connection, cohesion and coherence; Contradiction, tautology, semantic anomaly, circumlocution.	3 hrs
	Introduction to Scientific writing skills; Ethics of scientific write-up, Scientific method : Concept, hypothesis, theory, law; Design of experiment, Inductive and deductive reasoning.	3 hrs
	Module 2 Pattern of a literature review; Online search tools and tactics for literature survey Citing a reference in a text body and in the References, Styles of Reference citations, UGC-CARE LIST.	3 hrs
	Preparing the manuscript: Guidelines for authors; The IMRAD format. Framing the Title, Abstract, Key words; Introduction with defining the problem, Literature survey, Justification of study; Experimental procedure with proper techniques, reproducibility, units of measurements and statistical analysis; Results with proper presentation data and illustration; caption and legends; Discussion with components and sequence, comparison and integration of data; conclusions and significance; implication of further study.	6 hrs
	Research project proposal: Framing summary of Proposal (SOP), Scientific flow of Project proposal building.	3 hrs

Pedagogy:	Lectures/Tutorials/ PBL/Videos/Assignments/Group Activities/ Online teaching mode/Self-study.
Learning Outcome:	After successful completion of this course, students will be able to: 1. Present scientific information in appropriate language for various audiences, including scholarly and general, in print and online.

Course Code: ZOO 413:
Number of Credits: 2
Effective from AY: 2020 -21

Course Title: Immunology

Prerequisite for the Course:	Basic knowledge on cell biology	
Objectives:	1. To enable the student to understand the principles and mechanisms of immunology 2. To update the student on the scope and importance of clinical immunology and create an awareness about the inherent dangers of microbes 3. To impart conceptual understanding of functional organization of immune system and its responsiveness in health and disease	
Content	Module 1: An overview: Scope of immunology, recognition of self and non-self as a basic functional feature of immune system; Concepts of external and internal defense systems; Types of immunity: innate and acquired- types, functional features; concept of adaptive immunity; Immune tissues / organs-- types, anatomical location, structure and development; lymphocyte traffic during development. Antigens and Immunogenicity: Definition, characteristic features and classification; Adjuvants: definition, types and applications. Cellular Immune System: Lymphocytes: types, morphology, clones / sub-populations, distribution, B and T cell receptors, B and T cell epitopes, Toll-like receptors; Antigen presenting cells: antigen processing and presentation, MHC molecules and their immunologic significance	12 hrs
	Module 2: Antibodies: Primary structure, classification, variants and antigen-antibody interactions; Structural and functional characteristics of various antibody classes; Generation of diversity; Monoclonal antibodies: definition, production and applications; Antibody engineering and its applications. Complement system: Components, three major activation pathways, and immune functions including anaphylaxis and inflammation. Cytokines and Interferons: Definition and salient functional features; Interleukins: definition, types (lymphokines and monokines), and functions; Interferons--Origin, types and functions	12 hrs
Pedagogy:	Lectures/ tutorials/self-study	

Learning Outcome:	<ol style="list-style-type: none"> 1. Development of knowledge on the cellular ontogeny and organ involvement in immunity and how the immune system can fight infections and diseases. 2. Knowledge on development of body immune mechanisms and their applications. 3. Understanding of current immunology news and issues

Course Code: ZOO 414

Course Title: Nutritional Biochemistry

Number of Credits: 2

Effective from AY: 2020 -21

Prerequisite for the Course:	Basic knowledge of physiology and biochemistry	
Objectives:	<ol style="list-style-type: none">1. To make aware the students about the importance of nutrition in maintaining health.2. To cultivate proper feeding habits.3. To learn the proper and scientific value of different food items	
Content	<p>Module 1: Basic concepts of energy and energy expenditure; Calorific values of food – Basal metabolic rate, energy requirements of man, women, infants and children.</p> <p>Dietary Carbohydrates : Functions, classification, food sources, storage in body, biomedical importance ; Dietary Proteins - Functions, classification, food sources, composition, essential & non-essential amino acids, protein deficiency. biomedical importance; Dietary Fats: Function of fats, classification, food sources, composition, saturated and unsaturated fatty acids, biomedical importance. Vitamins: sources and functions, deficiency status.</p> <p>Module 2: Water as nutrient; Electrolyte concentrations of body fluids; Minerals: macro & micronutrients functions, sources. Bioavailability and deficiency of Calcium, Iron, Iodine, Sodium & Potassium (very brief account); concept of acidosis and alkalosis.</p> <p>Nutritional requirements during pregnancy and lactation; Nutrition during infancy, Nutrition of school children, Nutrition during adolescence, Nutrition during adulthood.</p> <p>Nutrigenomics of omega 3 and omega 6 fatty acids, essential amino acids, vitamin A, C, D, E and B complex.</p>	<p>12 hrs</p> <p>12 hrs</p>
Pedagogy:	Lectures/ tutorials/self-study	
Learning Outcome:	<ol style="list-style-type: none">1. Gaining the knowledge of importance about the nutrition and keeping ourselves in well- being state.2. Understanding the importance of some nutrient in controlling the expression of genes

--	---

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the spectroscopic techniques such as UV-Vis, IR at FY B Sc, S Y B Sc or T Y B Sc levels so as to have basic knowledge of spectroscopy and basic principles.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction of various concepts in molecular and atomic spectroscopy. 2. Learning data analysis, handling and interpretation of spectra 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to use spectroscopic methods for qualitative and quantitative analysis. 2. Evaluate the utility of UV/Vis spectroscopy as a qualitative and quantitative method. 3. Identification of functional group based on IR spectra 4. Students should be in a position to predict the structure based on IR, NMR, MS data. 	
Content:	<p>1.Introduction to spectrochemical methods</p> <p>1.1. Interaction of Electromagnetic Radiation with Matter: electromagnetic spectra, Regions of Spectrum; Numericals.</p> <p>1.2 Electronic spectra and Molecular structure: kinds of transition, Chromophores and auxochrome; absorption by isolated chromophores, conjugated chromophores, aromatic compounds, inorganic chelates.</p> <p>1.3. Infrared absorption and molecular structures: IR spectra, overtones and bands-basis of NIR absorption</p> <p>1.4. Spectral Databases: Identification of unknown; Application of UV-Vis and IR spectroscopy for identification of unknown compounds</p> <p>1.5. Solvents for spectrometry: Choices and effect of solvents on UV-Vis and IR spectra.</p> <p>1.6. Quantitative Calculations: The Lambert-Beer's Law; Mixtures of absorbing species-laws of additivity of absorbance; calibration curve for calculation of unknown; Spectrometric errors in measurement; Deviation from Lambert-Beer's law-chemical deviation, instrumental deviation; Quantitative measurement from IR spectra; Numericals for quantitative analysis using UV-VIS spectroscopy.</p> <p>1.7. Spectrometric Instrumentation of UV-Vis and IR (brief introduction only): Sources, monochromators, sample cells, Types of instruments; detectors; Instrumental wavelength and absorption calibration. (Chapter 16: Analytical Chemistry, G.D. Christian, 6thEd.)</p> <p>2. Molecular Luminescence: Fluorimetry, Phosphorimetry and Raman Spectroscopy</p> <p>2.1. Introduction,</p> <p>2.2. Fluorimetry : Theory and basic principle; Quenching; Spectrofluorimeters and applications</p> <p>2.3. Phosphorimetry: Theory and basic principle; phosphorimeters and application</p> <p>2.4. Raman Spectroscopy: Theory and Structural analysis using Raman Spectra (Chapter 6: Instrumental Methods of Chemical Analysis, G.W. Ewing, 5thEd)</p> <p>3. Atomic Spectroscopy</p> <p>3.1. Principles of emission</p> <p>3.2. Atomic Emission spectroscopy (AES)</p> <p>3.3. Flame Emission spectroscopy (FES)</p>	<p>12 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>3.4. Atomic absorption Spectroscopy (AAS) 3.5. X-Ray Fluorescence Spectroscopy (XRF) (Introduction, principles and applications of above techniques shall be discussed; Chapter 13: Analytical Chemistry Principles, J.H. Kennedy, 2nded)</p> <p>4.Spectrometric Identification of Organic compounds 4.1 Ultraviolet and visible Spectroscopy : Brief Revision of UV/VIS Spectroscopy ;Instrumentation and Sampling ; Applications of Electronic Spectroscopy:Conjugated Dienes, Trienes, polyenes, α, βunsaturated carbonyl compounds, aromatic hydrocarbons (Assignment based on BSc. Syllabus for calculating λ_{max}) (Kemp – Chap4) 4.2 Infrared Spectroscopy: Introduction to IR spectroscopy; Basic IR spectra interpretation; Frequencies of functional group. (Kemp – Chap2). 4.3 Proton and Carbon NMR Spectroscopy: Theory of NMR ; Chemical shift; factors influencing chemical shift ; Solvents used in NMR; Theory of spin-spin splitting and simple spin systems;Coupling constant calculation; Factors influencing coupling constant (Assignment based on BSc. Syllabus) (Kemp - Chapter 3) 4.4 Mass Spectrometry : Basic PrinciplesandInstrumentation: Problem solving in structure elucidation based on MS (Kemp - Chapter 5) 4.5. Conjoint Spectrometry Problems: Structural elucidation of organic molecules using UV, IR, NMR (1H, ^{13}C), MS, (Silverstein)</p> <p>(Note:Assignment based on BSc. syllabus for all above spectrometric structure should be given to student. <i>More weightage of lectures shall be given for solving IR and NMR data for structur elucidation</i>)</p>	14 hr
Pedagogy:	Mainly lectures and tutorials. Seminars / term papers /assignments / presentations / self-study or a combination of some of these can also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACC-402

Title of the Course: Laboratory Course in Analytical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied practical chemistry courses at F.Y B.Sc, S.Y. B .Sc & T Y B Sc levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	Introduction of various experimental techniques for analysis. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	Students should be in a position to use standardized material to determine an unknown concentration. To gain experience with some statistics to analyse data in laboratory Students should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p><i>This course consists of 6 units of experiments in various areas of Analytical chemistry. Minimum 12 experiments shall be carried out and at least 02 experiment from each unit shall be conducted.</i></p> <p>UNIT 1: STATISTICS 1.Calibration of apparatus (balance, volumetric flasks, pipettes and burettes) and preparation of standard solutions and standardisation</p> <p>UNIT 2: COLORIMETRY AND UV-VISIBLE SPECTROPHOTOMETRY 2.Estimation of Iron from Pharmaceutical sample (capsule) by thiocyanate method 3. Estimation of lead/nitrate in water sample 4. Estimation of KNO₃ by UV spectroscopy and K₂Cr₂O₇ by Visible spectroscopy 5. Simultaneous determination and Verification of law of additivity of absorbances (K₂Cr₂O₇ and KMnO₄) 6.Estimation of phosphoric acid in cola drinks by molybdenum blue method</p> <p>UNIT 3: FLAME SPECTROPHOTOMETRY 7.Estimation of Na 8.Estimation of K or Ca</p> <p>UNIT 4: VOLUMETRY 9.Estimation of Ca in pharmaceutical tablet. 10.Estimation of Al and/or Mg in antacid tablet</p> <p>UNIT 5: ION EXCHANGE CHROMATOGRAPHY &SOLVENT EXTRACT ION 11.Separation and Estimation of Zn and Cd 12.Separation and Estimation of chloride and bromide 13.Extraction of Cu as copper dithiocarbamate (DTC) using solvent extraction and estimation by spectrophotometry</p>	

	UNIT 6: INTERPRETATION EXERCISES 14. Thermal studies: TGDTA and Isothermal weight loss studies of various hydrated solids like $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{Ca}_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$, $\text{Fe}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ 15. X-ray powder diffractometry: Calculation of lattice parameters from X-ray powder pattern of cubic system such as NiMn_2O_4 , CoFe_2O_4 etc.	
Pedagogy:	Prelab exercises / assignments / presentations / lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACO-401

Title of the Course: Analytical Techniques

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different analytical techniques used for qualitative, quantitative estimation	
Course Outcomes:	3. Students should be in a position to understand principle behind different analytical techniques 4. With the knowledge basic techniques used for qualitative and quantitative estimation students should be in a position to choose for appropriate technique for particular analysis 5. Students should be in a position to select the separation techniques for purification of analytes.	
Content:	<p style="text-align: center;">Section A</p> <p>1 Analytical Objectives, Data Handling and Good Laboratory Practice (GLP) Scope of analytical science and its literature, qualitative and quantitative analysis, ways to express accuracy and precision, types of errors and their causes; significant figures, control charts, confidence limit, test of significance, rejection of a result- the Q-test. Introduction to significant analytical procedure such as GLP- standard operating procedures, quality assurance, quality control and analytical method validation.</p> <p>2 Sampling and Calibration Methods Sampling and sample preparation, general steps in chemical analysis, calibration of glass wares. Finding the best straight line-least square regression, correlation coefficient; Calibration curves, standard addition technique and internal standards. Chemical concentrations.</p> <p>3 Electroanalytical techniques Introduction to electroanalytical techniques, electrochemical cells, electrode potentials, voltammetry and polarography, cyclic voltammetry, coulometry, controlled potential coulometry and coulometric titrations, Stripping voltammetry, ion-selective electrodes and sensors; Evaluation and Calculation; Application to Inorganic and Organic Trace analysis</p> <p style="text-align: center;">Section B</p> <p>1. Extraction Techniques Liquid-liquid extraction/solvent extraction: partition coefficient, distribution ratio and percent extraction; choice of solvents; Solvent extraction of metal ions-ion association complexes and metal chelates; multiple batch extraction, Craig's counter-current distribution; Introduction to green analytical extraction methods: Supercritical Fluid Extraction (SFE); Pressurized Liquid Extraction (PLE); Ultrasound Assisted Extraction (UAE); Microwave Assisted Extraction (MAE);</p>	<p>7 hr</p> <p>5 hr</p> <p>6 hr</p> <p>4 hr</p>

	<p>Enzyme Assisted Extraction (EAE); Solid Phase Microextraction (SPME); Solid Phase Extraction (SPE)</p> <p>2. Basic Principles in Chromatographic Methods Principles of chromatography, classification of chromatographic techniques based on mechanism of retention, configuration, mobile and stationary phase. Efficiency of separation- plate theory (theoretical plate concept) and rate theory (Van Deemter equation). Principles and applications of Paper chromatography, thin layer chromatography, HPTLC, Size exclusion and Ion exchange chromatography. Counter-current chromatography for isolation of natural products.</p> <p>3. Gas and Liquid Chromatography Introduction; Instrumental Modules; The Separation System; Choice of Conditions of Analysis; Sample Inlet Systems; Detectors; Practical Considerations in Qualitative and Quantitative Analysis; Coupled Systems-introduction to GCMS, LCMS; Applicability-interpretation and numerical problems; Recent and Future Developments</p> <p>4. Radioanalytical techniques Theory and principles of radio analytical technique, detection of nuclear radiation, radiation detectors, pulse height analysis, counting error, analytical application of radioisotopes, neutron activation analysis and isotope dilution analysis.</p>	<p>4 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / presentations/ self-study or a combination of some of these can also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Title of the Course: General Inorganic Chemistry

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in Chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.BSc. levels so as to have basic knowledge of Inorganic Chemistry and basic principles.	No. of lectures
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce atomic / molecular structure and symmetry. 2. To provide fundamental knowledge of solid state chemistry. 3. To introduce basic aspects of coordination / organometallic / bioinorganic chemistry. 4. To provide the concepts of acids and bases. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand atomic and molecular structure and the importance of symmetry. 2. Students should be able to understand molecular shapes. 3. Students should be in a position to understand concepts in i) solid state chemistry, ii) coordination chemistry, iii) organometallic chemistry, iv) bioinorganic chemistry. 	
Content:	<p>1. Atomic structure, molecular structure and bonding</p> <p>1.1 Atomic Structure: Structures of hydrogenic atoms: some principles of quantum mechanics. Many electron atoms: penetration & shielding, building up principle, classification of elements. spectroscopic terms. Atomic/ionic radii, ionization energy, electron affinity, electronegativity, polarizability.</p> <p>1.2 Molecular Structure & bonding: Lewis structures, VSEPR model, the basic shapes. Valence bond theory: the hydrogen molecule, homonuclear diatomic & polyatomic molecules; hybridisation. molecular orbital theory: approximation, bonding & antibonding orbitals. Homonuclear diatomic & Heteronuclear diatomic molecules.</p> <p>2. Molecular Symmetry:</p> <p>2.1 Symmetry elements</p> <p>2.2 Symmetry operations, equivalent symmetry elements and equivalent atoms, symmetry point groups with examples, point groups of higher symmetry, systematic procedure for symmetry classification of molecules and illustrative examples,</p> <p>2.3 Dipole moment, optical activity and point groups.</p> <p>3. Solid state chemistry</p> <p>3.1 Structures of solids: crystal structures, lattices & unit cells, close packing of spheres, holes in closed-packed structures.</p> <p>3.2 Structures of metals & alloys: polytypism, nonclosed-packed structures, polymorphism of metals, atomic radii of metals, alloys, substitutional solid solutions, interstitial solid solutions of non-metals, intermetallic compounds.</p> <p>3.3 Ionic solids: Basic characteristic structures of ionic solids, the rationalization of structures, ionic radii, radius ratio, structure maps, the energetics of ionic bonding, lattice energy.</p>	<p>9 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>4. Coordination Chemistry</p> <p>4.1 Introduction, representative ligands, nomenclature,</p> <p>4.2 Constitution & geometry, low coordination numbers, intermediate coordination numbers, higher coordination numbers, polymetallic compounds.</p> <p>4.3 Isomerism & chirality in square planar & octahedral complexes, ligand chirality.</p> <p>4.4 Thermodynamics of complex formation: formation constants, chelate & macrocyclic effects, steric effects & electron delocalization.</p> <p>4.5 Electronic properties of metal complexes: CFT applied to octahedral and tetrahedral complexes, magnetic moments/CFSE. Electronic spectroscopy: basic concepts, interpretation of spectra of d^1 & d^2 ions (Orgel diagram for octahedral and tetrahedral complexes).</p> <p>5. Organometallic Chemistry</p> <p>5.1 Introduction to organometallic chemistry, nomenclature, stability and inert gas rules (neutral atom and donor pair electron count methods).</p> <p>5.2 Ligands CO & phosphines, homoleptic carbonyls/synthesis/properties/ oxidation-reduction of carbonyls/ basicity/reactions of CO/spectroscopic properties of metal carbonyls.</p> <p>5.3 Oxidative addition and reductive elimination.</p> <p>6. Basic Bioinorganic Chemistry</p> <p>6.1 Macronutrients/micronutrients. Role of elements in biology. Metal ion transport role.</p> <p>6.2 Definition of metallobiomolecules / metalloporphyrins, structure of porphine and heme group, examples of metalloenzymes of copper and zinc.</p> <p>7. Acids and Bases</p> <p>7.1 Brönsted Acidity, proton transfer equilibria in water, solvent levelling, solvent system definition if acids & bases, characteristics of Brönsted acids,</p> <p>7.2 Periodic trends in aqua acid strengths, non-aqueous solvents, Lewis acidity, hard & soft acids and bases, solvents as acids & bases, superacids & superbases.</p>	<p>5 hr</p> <p>4 hr</p> <p>3 hr</p> <p>5 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Title of the Course: Lab Course in Inorganic Chemistry

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels so as to have basic knowledge of experimental chemistry.	No. of lectures
Course Objectives:	Students shall be trained in the preparation of coordination compounds / double salts, understanding of redox chemistry, determination of metal content and degree of hydration, and determination of the formula of synthesized compounds. Students will be given hands-on experience in using colorimeter / UV-Vis spectrophotometer while performing instrumental analysis.	
Course Outcomes:	1. Students should be in a position to: i) set up and perform inorganic synthesis ii) isolate and purify crystalline product. iii) develop skills for compound characterization iv) determine the metal content by titrimetry / gravimetry /colorimetry.	
Content:	<p>Synthesis of inorganic compounds (any six)</p> <ol style="list-style-type: none"> 1. $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ 2. $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ 3. $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]\text{Cl}_3$ 4. $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 5. $\text{K}_3[\text{Cr}(\text{SCN})_6] \cdot 4\text{H}_2\text{O}$ 6. $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 7. $[\text{Cr}(\text{OAc})_2]_2 \cdot 2\text{H}_2\text{O}$ 8. Potash alum from scrap aluminium 9. Zinc iodide (Redox synthesis) <p>Quantitative estimations/determinations (any six)</p> <ol style="list-style-type: none"> 1. Estimation of Ni in $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ titrimetry/gravimetry 2. Estimation of Co in $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ volumetrically 3. Estimation of oxalate in $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ or $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ 4. Estimation of nitrite by redox titration 5. Estimation of calcium in calcite ore 6. Estimation of copper in gun metal alloy or Devarda's alloy iodometrically 7. Estimation of Cr in chrome alum and $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ to determine degree of hydration. 8. Colorimetric determination of Cr or Ni 	<p>24 hr</p> <p>24 hr</p>
Pedagogy:	Students should be given suitable pre-lab and post-lab assignments and explanation revising the theoretical aspects of laboratory experiments prior to the conduct of each experiment. Each experiment should preferably be done individually by the students.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ICO-401

Title of the Course: Topics in Inorganic Chemistry & Environmental Chemistry

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Student should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels and / or CHIC-401 course so as to have basic knowledge of Inorganic / environmental chemistry.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To provide fundamental aspects of transition & inner transition metals & their compounds.2. To provide knowledge of main group elements of the periodic table & their compounds3. To introduce various global phenomenon's of atmosphere & environment, follow directive of the Supreme Court in 1993 to introduced environmental education at all levels, have a fair knowledge on the various global activities to justify permissible or adverse, so that future generation are not adversely affected.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in position to understand fundamentals / usefulness of transition & inner transition metals.2. Students should be in position to understand chemistry main group elements.3. Students shall be aware of the maintenance of healthy living atmosphere on the globe.	
Content:	<p style="text-align: center;">SECTION-I</p> <p>1. Chemistry of transition & inner transition elements</p> <p>1.1 Transition elements: IUPAC definition of transition elements, occurrence, physical & chemical properties, noble character, metal oxides & oxido complexes, examples of metal-metal bonded clusters.</p> <p>1.2 Inner transition elements: Lanthanides, occurrence, properties, oxidation states, electronic structure, colour and spectra, magnetic properties, lanthanide contraction, compounds of lanthanides. Actinoid chemistry, general trends.</p> <p>2. Main group elements and their compounds</p> <p>2.1 Boron group: Compounds of boron:- borazine and boron nitride, synthesis, properties, structure & bonding. Borates: classification, structures & examples.</p> <p>2.2 Carbon group: Allotropes of carbon including C₆₀, intercalation compounds of graphite, carbides. Compounds of silicon: silicates, zeolites & silicones.</p> <p>2.3 Nitrogen group:- Introduction: oxides & oxyacids of nitrogen. 2.4 Oxygen group: oxyacids & oxohalides of S, S₄N₄ ring compounds: synthesis, properties, structure & bonding.</p>	<p>9 hr</p> <p>9 hr</p>

	<p style="text-align: center;">SECTION-II</p> <p>1. Atmosphere Structure and properties of the atmosphere, composition of atmosphere and vertical temperature behaviour, lapse rate and temperature inversion.</p> <p>2. Air Pollution Classification of air pollutants and photochemical reactions in the atmosphere Common air pollutants (e.g. CO, NO_x, SO₂, hydrocarbons and particulates) (a) sources (b) physiological and environmental effect (c) monitoring, d) various remedial & technological measures to curb pollution. Air quality standards.</p> <p>3. Water pollution Importance of buffer & buffer index in waste water treatments. Chemical, physical & biological characteristics of water pollution, specific & non-specific characterization of water. DO, BOD, COD, and chlorine demand, typical water treatment & waste water treatment (Municipal).</p> <p>4. Treatment of Industrial wastes Electroplating industry, fertilizer industry and pharmaceuticals industries.</p> <p>5. Biogeochemical cycles: Carbon and Nitrogen cycles nature</p>	<p>2 hr</p> <p>7 hr</p> <p>5 hr</p> <p>2 hr</p> <p>2 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCC-401

Title of the Course: Structure, reactivity, stereochemistry and reaction mechanism

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	3. Introduction of various concepts based on molecular orbital theory. 4. Introduction of topicity, prostereoisomerism and chemo-, regio- and stereoselectivity in organic reactions. 5. Learning mechanistic aspects of various type of reactions in organic synthesis.	
Course Outcomes:	5. Students should be in a position to evaluate effect of delocalization of electrons & presence or absence of aromaticity in organic compounds. 6. Students should be in a position to apply various concepts in stereochemistry to understand stereochemical output in a reaction. 7. Students shall be in a position to understand/propose plausible mechanism of organic reactions.	
Content:	1. Molecular orbitals and delocalized chemical bonding: Qualitative description of Molecular orbitals of simple acyclic and monocyclic Systems, Frontier molecular orbitals, Conjugation, cross conjugation, resonance, hyperconjugation and tautomerism (types and examples), Aromaticity: Origin of Huckel's rule, examples of aromatic, non-aromatic and antiaromatic compounds; concept of Mobius aromaticity. 2. Structure & Reactivity: Acidity, basicity and pKa of organic compounds; Acid and base strengths; HSAB concept & Factors affecting it, Effect of structure & medium on acid and base strength, Concept of superacids and superbases, Electrophilicity & Nucleophilicity, Examples of ambident nucleophiles & electrophiles. (Including revision of aromatic electrophilic and nucleophilic substitution) 3. Stereochemistry: Brief revision of configurational nomenclature: R & S; D & L; E & Z; cis & trans and <i>syn</i> & <i>anti</i> nomenclature. Chirality in molecules with two and more chiral centres. Conformational analysis of open chain compounds (Butane, 2, 3-butane diol, 2,3-dibromobutane etc.). <i>Erythro</i> and <i>threo</i> nomenclature. Topicity and Prostereoisomerism: Topicity of ligands and faces-homotopic, enantiotopic and Cram's rule / diastereotopic ligands and faces. Introduction to chemoselective, regioselective and stereoselective reactions. Stereochemistry of <i>cis</i> - and <i>trans</i> -decalins, conformation and reactivity of cyclohexane and substituted cyclohexanes, cyclohexene / cyclohexanone. 4. Reaction Mechanism: Brief revision of carbocations, carbanions, free radicals, carbenes and nitrenes with reference to generation, structure, stability and reactivity; Types of mechanisms, types of reactions, thermodynamic and kinetic control. The Hammond postulate and principle of microscopic reversibility, Methods of determining reaction mechanisms like- 1) Identification of products,	06 hr 06 hr 08 hr 06 hr

	<p>2) Determination of the presence of intermediates (isolation, detection, trapping and addition of suspected intermediate, 3) Isotopic labelling, 4) Stereochemical evidence, 5) Kinetic evidence and 6) Isotope effect (at least two reactions to exemplify each method be studied)</p> <p>5. Aliphatic Nucleophilic substitution: Brief revision of nucleophilic substitutions with respect to Mechanism, Various factors affecting such reactions; The Neighbouring Group Participation (NGP)/ Anchimeric assistance: General approach to various NGP processes; NGP by unshared/lone pair of electrons; NGP by π-electrons; NGP by aromatic rings (formation of phenonium ion intermediate); NGP by sigma bonds with special reference to bornyl and nor-bornyl system (formation of non-classical carbocation)</p> <p>6. Elimination reactions: The E2, E1 and E1cB mechanisms. Orientation of the double bond, Saytzeff and Hofmann rule. Effects of changes in the substrate, base, leaving group and medium on 1) overall reactivity, 2) E1 vs. E2 vs. E1cB and 3) elimination vs substitution, Mechanism and orientation in pyrolytic <i>syn</i> elimination (various examples involving cyclic and acyclic substrates to be studied).</p>	<p>06 hr</p> <p>04 hr</p>
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

	<p>3. Organic synthesis (any four experiments):</p> <p>a) Aliphatic electrophilic substitution: Preparation of iodoform from ethanol & acetone.</p> <p>b) Aromatic electrophilic substitution (anyone): Preparation of p-bromoacetanilide, bromination of acetophenone to phenacyl bromide, nitration of naphthalene to 1-nitronaphthalene, nitration of benzaldehyde to 3-nitrobenzaldehyde.</p> <p>c) Oxidation of: i) Benzoic acid from toluene ii) Cyclohexanone from cyclohexanol, iii) isoborneol to camphor using Jones reagent (any one).</p> <p>d) Reduction (any one): Reduction of o-nitroaniline to o-phenylenediamine using Sn/HCl; Reduction of p-nitro benzaldehyde to p-nitrobenzyl alcohol using NaBH₄</p> <p>e) Bromination of an alcohol using CBr₄/ triphenylphosphine.</p> <p>f) Grignard reaction: Triphenylmethanol from benzoic acid ester or benzophenone. g) Aldol condensation: Dibenzal acetone from benzaldehyde</p> <p>h) Acetoacetic ester condensation : Preparation of ethyl n-butylacetoacetate or ethyl acetoacetate.</p> <p>i) Cannizzaro reaction using 4-chlorobenzaldehyde as substrate.</p> <p>j) Friedel Craft's reaction (any one): using toluene and succinic anhydride, resorcinol to resacetophenone, benzene and maleic anhydride to β-benzoylacrylic acid</p> <p>k) Solvent free preparation of coumarin by the Knoevenagel condensation under MW irradiation.</p> <p>l) Preparation of oxidizing agent (any one): Pyridinium chlorochromate-silica, pyridinium chlorochromate-alumina, MnO₂.</p> <p>m) Preparation of cuprous chloride.</p> <p>3. Isolation from natural sources : (any one) Caffeine from tea powder, piperine from pepper, cinnamaldehyde from cinnamon</p>	16 hr
Pedagogy:	Students should be given suitable pre- and post-lab assignments and explanation revising the theoretical aspects of laboratory experiments prior to the conduct of each experiment. Each of the experiments should be done individually by the students.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCO-401

Title of the Course: Synthetic Organic Chemistry I

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels as well as the course CHOC-401 so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	1. Introduction to concepts of functional groups and their interconversion 2. Learning mechanistic concepts of carbon-carbon bond making by nucleophilic addition to carbonyl group 3. Learning mechanistic aspects of various oxidation & reduction processes used in organic syntheses.	
Course Outcomes:	1. Students should be in a position to choose appropriate oxidizing agent for oxidation of a particular functional group. 2. Students should be in a position to choose appropriate reducing agent for reduction of a particular functional group. 3. Students shall be in a position to understand/propose plausible mechanism of organic reactions. 4. Student should be able to choose appropriate nucleophilic addition reaction for making carbon-carbon bond.	
Content:	<p>1. Oxidation reactions: Oxidation of organic compounds using chromium (PCC, PDC) and manganese compounds, Oppenauer oxidation, Swern oxidation, ozonolysis. Other methods of oxidation such as selenium dioxide, Pb(OAc)₄, HIO₄, peracids, peroxides, OsO₄, RuO₄, DMSO (Swern) sodium bromate / CAN & NaOCl, DDQ, Prevost's reagent and Woodward Conditions; Catalytic oxidation over Pt, Photosensitised oxidation of alkenes, oxidation with molecular oxygen, aromatization, silver based reagents.</p> <p>2.Reduction reactions: Reduction of organic compounds using hydride-transfer reagents and related reactions : MPV reduction, NaBH₄, Trialkylborohydrides, LAH & lithium hydridoalkoxyaluminates, mixed LAH-AlCl₃ reagents, DIBAL and reduction with borane and dialkylboranes, Enzymatic reduction involving liver alcohol dehydrogenase/NADH & Bakers' yeast, catalytic hydrogenation, Dissolving metal reductions including acyloin condensation, Clemmensen reduction and Birch reduction, Other methods of reduction: Wolff-Kishner, Raney Ni desulphurisation, di-imide.</p> <p>3.Halogenation: Formation of Carbon Halogen bonds: Substitution in saturated compounds, alcohols, carbonyl compounds, substitution at allylic and benzylic compounds, bromodecarboxylation (Hunsdiecker reaction), Finkelstein reaction, iodolactonisation.</p>	<p>11 hrs</p> <p>9 hrs</p> <p>5 hrs</p>

	4. Esterification, amide preparation and hydrolysis: (study of different mechanisms and reagents)	6 hrs
	5. Name reactions: Knoevenegel Reaction, Claisen, Darzen, Stobbe, Perkin, Aldol, Benzoin, Pechmann condensation.	5 hrs
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Title of the Course: General Physical Chemistry

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in chemistry at F.Y B.Sc, S.Y B.Sc & T.Y B.Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	6. Introduction of various concepts on thermodynamics. 7. Introduction of electro chemistry and kinetics. 8. Learning quantum chemistry.	
Course Outcomes:	8. Students should be in a position to understand various concepts in physical chemistry. 9. Students should be in a position to apply these concepts during the lab course in physical chemistry. 10. Students shall be in a position to answer the NET/SET examination questions based on these topics.	
Content:	<p>1.Thermodynamics</p> <p>1.1 Thermodynamic properties: Gas laws, Real gasses, Boyle temperature, Critical temperature, State and path properties. Intensive and extensive properties. Exact and inexact differentials. Internal energy, enthalpy, entropy, free energy and their relations and significances. Maxwell relations. Thermodynamic equations of state.</p> <p>1.2 Joule-Thomson effect. Joule-Thomson coefficient for van der Waals' gas. Joule-Thomson effect and production of low temperature, adiabatic demagnetization, Joule-Thompson coefficient, inversion temperature.</p> <p>1.3 The third law of thermodynamics. Need for the third law. Apparent exceptions to third law. Application of third law. Use of thermodynamic functions in predicting direction of chemical change. Entropy and third law of thermodynamics.</p> <p>1.4 Phase equilibria: Phase rule, Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.</p> <p>1.5 Three component systems: Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. The role of added salts.</p> <p>2.Electrochemistry</p> <p>2.1 EMF series, decomposition potential and overvoltage, electronegativity, basic principles, completeness of deposition, Separation with controlled potentials, constant current electrolysis, composition of electrolyte, potential buffers, physical characteristics of metal deposits.</p> <p>2.2 Electroplating and electroless plating, electrosynthesis.</p> <p>2.3 Concepts of acid-base aqueous and non-aqueous solvents, hard and soft acid-base concept and applications.</p>	<p>10 hrs</p> <p>06 hrs</p>

Programme: M. Sc. Part-I (Chemistry)

Course Code: PCC-402 Title of the Course: Laboratory Course in Physical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Chemistry at F Y B Sc, S Y B Sc & T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various concepts on thermodynamics. 2. Introduction of electro chemistry and kinetics.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry by conducting experiments. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	1. To study the kinetics of hydrolysis of ethyl acetate and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 2. To study the kinetics of the reaction between Potassium persulphate (K ₂ S ₂ O ₈), and Potassium iodide (KI), and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 3. To determine the order of reaction between potassium persulphate and potassium iodide by graphical, fractional change and differential methods. 4. To determine the degree of hydrolysis of salt of weak base and strong acid using conductometer. 5. To determine the composition of a mixture of acetic acid, dichloroacetic acid and hydrochloric acid by conductometric titration. 6. To determine the dissociation constants of a dibasic acid and obtain derivative plot to get equivalence point. 7. To determine the dissociation constants of a tribasic acid (Phosphoric acid) obtain derivative plot to get equivalence point. 8. To determine formal redox potential of Fe ²⁺ /Fe ³⁺ and Ce ³⁺ /Ce ⁴⁺ system obtain derivative plot to get equivalence point. 9. To study the three component system such as toluene, ethanol and water. 10. To study the three component system such as acetic acid, chloroform; and water and obtain tie line. 11. To determine the molecular weight of polyvinyl alcohol by viscosity measurement. 12. To determine the molecular weight of polystyrene by viscosity measurement.	48 hrs
Pedagogy:	Lectures / tutorials / seminars / term papers / assignments / presentations / self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.	
References/ Readings	1. A. Finlay & J.A. Kitchener, " <i>Practical Physical Chemistry</i> ", Longman 2. F. Daniels & J.H. Mathews, " <i>Experimental Physical Chemistry</i> ", Longman. 3. A.M. James, " <i>Practical Physical Chemistry</i> ", 4. D.P. Shoemaker & C.W. Garland, " <i>Experimental Physical Chemistry</i> ", McGraw-Hill.	

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Physical Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various mathematical concepts for Chemistry. 2. Introduction of topics viz. magnetic materials and properties, photochemistry, Nano materials.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry. 3. Students shall be in a position to answer the NET / SET examination questions based on these topics.	
Content:	<p>1.Mathematical Preparations:</p> <p>1.1 Introduction to various functions and function plotting (exponential, logarithmic, trigonometric etc.), functions of many variables. Complex numbers and complex functions.</p> <p>1.2 .Linear equations, vectors, matrices and determinants.</p> <p>1.3 Basic rules of differentiation and integration, Partial differentiation, location and characterization of critical points of a function, Regression methods, curve fitting.</p> <p>1.4 Introduction to series, convergence and divergence, power series, Fourier series, Fourier transformations and Numerical methods</p> <p>2.Magnetic Properties</p> <p>2.1 Types of magnetism (dia, para, ferro, antiferro and ferrimagnetism) Magnetic susceptibility and its determination.</p> <p>2.2 Magnetization curves and hysteresis, magnetic anisotropy, magnetic exchange interactions, Neel temperature and magnetic transition.</p> <p>2.3 Ceramic magnetic materials, Applications of magnetic Materials</p> <p>3.Photochemistry:</p> <p>3.1 Absorption and emission of radiation of photochemical interest. Einstein's equation.</p> <p>3.2 Jablonskii's diagram illustrating fluorescence and phosphorescence.</p> <p>3.3 Prompt and Delayed Fluorescence. Factors affecting Fluorescence life time and quantum yield.</p> <p>3.4 Flash photolysis and lasers. Photosensitised reactions and photosynthesis.</p> <p>4. Nanomaterials:</p> <p>4.1 Introduction, Chemical synthesis and methods of structural characterization.</p>	<p>18 hrs</p> <p>08 hrs</p> <p>06 hrs</p> <p>04 hrs</p>

	4.2 Areas of application, Societal health and environmental impact.	
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / self-study / or a combination of some of these can be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-501

Title of the Course: Fundamentals of Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge about difference between analytical chemistry and chemical analysis, role of analytical chemist, differences between conventional method of analysis and instrumental methods.	
Course Objectives:	1. Introduction to the various chemical method of analysis, details of underlying principle of chemical methods, advantages and limitations 2. Application of chemical methods for qualitative and quantitative estimation	
Course Outcomes:	1. Students should be in a position to understand basic principle behind different conventional method of analysis. 2. Student should understand the limitation of method of analysis, should be in a position to choose for appropriate chemical method for particular analysis 3. Students should be in a position to understand the basic chemistry on which the method of analysis based on.	
Content:	1 Acid-Base Titrations Theory of acid-base indicators for Acid-Base titrations; colour change; range of indicator; selection of proper indicator; indicator errors; neutralization curves for strong acid-strong base, weak acid-strong base and weak base-strong acid weak acid-weak base titrations; poly functional acids and bases; titration curves for poly functional acids and bases; titration curves for amphoteric species; determining the equivalence point; feasibility of acid - base titrations; magnitude of the equilibrium constant; effect of concentration; typical applications of acid-base titrations. 2 Precipitation titrations Introduction; feasibility of precipitation titrations; titration curves; effect of titrant and analyte concentration on titration curves; effect of reaction completeness on titration curves; titration curves for mixture of anions; indicators for precipitation titrations; the Volhard, the Mohr and the Fajans methods 3 Complexometric titrations The complex formation reactions; stability of complexes; stepwise formation constants; organic complexing agents; amino carboxylic acid titration; EDTA; acidic properties of EDTA; EDTA complexes with metal ions; equilibrium calculations involving EDTA in solution; condition of formation constants; EDTA titration curves; effect of other complexing agents on EDTA; factor affecting the titration curves; completeness of reaction; indicators for EDTA titrations; theory of common indicators; titration methods using EDTA- direct titration, back titration and displacement titration; indirect determinations; titration of mixtures; selectivity, masking and demasking agents; applications of EDTA titrations- hardness of water; magnesium and Al in antacids; magnesium, manganese and zinc in a mixture.	10 hrs 3hrs 8hrs

	4. Basic concepts in Electrochemical Titrations Faradic and non-Faradic currents; reversible and irreversible cells; EMF series; standard electrode potential; Nernst equation; calculation of cell potential; effect of current; ohmic potential; polarization; decomposition potential; over voltage; concentration polarization; mechanism of mass transport; introduction to potentiometric methods 5. Redox titrations Redox Titrations: Equilibrium constants for redox reactions- electrode potentials in equilibrium systems; calculation of equilibrium constants; redox titration curves- formal redox potentials; derivation of titration curves; factors affecting the shape of titration curves concentration; completeness of reaction; titration of mixtures- feasibility of redox titrations; detection of end point and redox indicators; structural aspect of redox indicators; specific and nonspecific indicators; choice of indicator; potentiometric end point detection; sample preparation- pre-reduction and pre-oxidation. 6. Radioimmunoassay Radioimmunoassay; its principle and applications; instrumentation for radio bioassay; clinical application of the radioimmunoassay of insulin, estrogen and progesterone; receptor techniques of breast cancer; enzyme- linked immunosorbent assay; principles; practical aspects; applications. 7. Gravimetric analysis Introduction; properties of precipitates and precipitating reagents; completeness of precipitates; super saturation and precipitate formation; particle size and filterability of precipitates; colloidal precipitates; crystalline precipitates; purity of the precipitate; co-precipitation, post precipitation; conditions for precipitation; fractional precipitation; precipitation from homogenous solution; organic reagent as precipitants-dimethyl gloxime, oxine, cupferon, salicyldoxime, washing of precipitates; drying and ignition of precipitates; calculation of results from gravimetric data; applications.	3 hrs
		4 hrs
		3 hrs
		5hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-502

Title of the Course: Techniques in Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques such as colorimetry, pH-metry, emission techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
<u>Course Objectives:</u>	1. Introduction of various experimental techniques for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
<u>Course Outcomes:</u>	1. Students should be in a position to differentiate between various analytical techniques based on their theory and sensitivity achieved. 2. Exposure to various electrochemical and optical techniques for its application to qualitative and quantitative estimation at trace level.	
<u>Content:</u>	1. Principles and practise of optical analytical techniques –Part-1 1.1. Nephelometry and Turbidimetry: Introduction to principle, instrumentation and application of nephelometry, turbidimetry. Factors affecting measurement, choice between nephelometry and turbidimetry; turbidimetry and colorimetry; nephelometry and fluorimetry; applications of nephelometry and turbidimetry. 1.2. Introduction, principle and Instrumentation of Polarimetry; application of optical rotation method in rate constant determination; acid- catalyzed muta rotation of glucose; inversion of cane sugar; relative strengths of acids. Introduction to terms such as optical rotatory dispersion (ORD), plan curves, cotton effect curves, circular dichroism, octant rule for ketones.	10hrs
	2. Principles and practise of optical analytical techniques –Part-2 2.1. Principles and practices of Spectrophotometric Analysis: Introduction; law of absorption; absorbance and transmittance spectrum; technique for colour comparison; spectrophotometer instrumentation- single and double beam spectrophotometer; applications 2.2. Principles of Emission Techniques: Theory; excitation techniques; electrodes and their shapes; Quantitative and qualitative application, brief introduction to ICP-MS	10hrs
	3. Principles and practise of electro analytical and thermal techniques 3.1. Introduction to Ion selective electrodes; construction, application and selectivity coefficient of Ion selective electrode; pH measurement; buffer solution; glass electrode; instrument for pH measurement. 3.2. Thermoanalytical Methods: Thermogravimetry, Differential Thermal Analysis (DTA), and Differential Scanning Calorimetry: DSC 3.3. Basic aspects of conductometric titration; types of conductometric titration; advantages and disadvantages of conductometric titration;	16hrs

	<p>Introduction; theory; instrumentation; advantages, disadvantages and applications of High frequency titrations.</p> <p>3.4. Karl Fischer Titration: Introduction; theory; instrumentation; advantages, disadvantages and applications; Karl Fischer reagent- Introduction; determination of water content in industrial samples.</p>	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling at MSc part-I level.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different separation techniques used for qualitative, quantitative estimation	
Course Outcomes:	1. Students should be in a position to understand principle behind different purification techniques. 2. Students should be in a position to select the separation techniques for purification of analytes from interferents. 3. To understand the HPLC method development and application in qualitative and quantitative analysis	
Content:	<p>1. Basic Separation Technique:</p> <p>1.1. General aspects of separation techniques-role of separation technique in analysis;</p> <p>1.2. Separating the analyte from interferents</p> <p>1.3. General theory of separation efficiency: Separation factor</p> <p>1.4. Classifying separation techniques: Separations based on Size; Separations based on mass or density, Separations based on complexation reactions (Masking); Separations based on a change of state; Separations based on a partitioning between phases. (Note: Following techniques shall be discussed as representative example)</p> <p>1.5. Basic principles of distillation; theory of vacuum, steam, azeotropic and fractional distillation.</p> <p>1.6. Fractionation by solvent extraction: based on chemical nature and based on polarity of analyte.</p> <p>1.7. Centrifugation techniques: Sedimentation velocity, Analytical and preparative centrifugation; Density gradient centrifugation; applications in separation.</p> <p>2. Chromatographic Methods:</p> <p>2.1. Introduction to chromatography: definitions, theories, principles of chromatographic technique, terms and parameters used in chromatography, classification of chromatographic methods, Partition versus adsorption chromatography, development of chromatograms, qualitative and quantitative analysis by chromatography;</p> <p>2.2. Planar Chromatography (Paper and thin layer):</p> <p>2.2.1. Paper Chromatography- introduction, principle, theory, types (ascending, descending, circular, two dimensional paper chromatography); techniques; choice of solvent; multiple development, qualitative and quantitative measurement applications;</p> <p>2.2.2 Thin Layer Chromatography (TLC)- definition; mechanism; efficiency of thin layer plates; methodology (technique); criteria</p>	<p>6 hrs</p> <p>24hrs</p>

	<p>for selection of stationary and mobile phases (numerical to calculate elution strength of mixed solvents used as mobile phase); choice of adsorbents; preparation of plates; spotting (spot capacity); development of chromatogram; identification and detection using physical and chemical methods; reproducibility of R_f values and improving resolution; Two-dimensional TLC; comparison of TLC with paper chromatography, column chromatography, thin layer ionophoresis and electrophoresis; Qualitative, quantitative evaluation and applications;</p> <p>2.3. High-performance TLC (HPTLC): introduction, principle, theory, classification (classical, high performance, ultra, preparative HPTLC); Difference between TLC and HPTLC with respects to the parameters; scanning densitometer; Quantitative analysis using TLC-densitogram and applications.</p> <p>2.4. Gas Chromatography (GC): Instrumentation, selection of operating condition, choices of GC column, methods to prepare derivatives of samples (silylation, acylation, alkylation), working principle of GC detectors such as TCD, ECD, FID, Analysis of GC data and quantification methods such as normalizing peak area, internal std., external std, standard addition.</p> <p>2.5. Column Chromatography- definition; types (conventional, flash, LPLC, Dry column vacuum chromatography); principle; packing, loading, eluting and collecting eluent in the column chromatography and experimental requirements; theory of development; migration rates of solutes; band broadening and column efficiency; variables that affect column efficiency; Van Deemeter equation and its modern version; scale-up and thump rule for conventional column, qualitative and quantitative analysis; applications.</p> <p>2.6. Liquid-liquid partition chromatography (HPLC)- Introduction; selection of stationary and mobile phase; types of bonded phase chromatography-NPC and RPC and stationary phases used; reversed phase partition chromatography; steps in HPLC method development in partition chromatography- elution techniques (isocratic and gradient, ion pairing agents, buffer agents, organic modifiers); optimization of capacity factor, gradient selectivity factor and column plate numbers; numerical on method development using Snyder's polarity index. Preparative vs analytical HPLC; Chiral chromatography- Pirkle stationary phases, examples of enantiomer separation such as ibuprofen, calculation of enantiomeric excess. Choosing detectors- working principle of RI, UV-Vis, conductivity and ELSD.</p> <p>2.7. Size Exclusion Chromatography: definition; theory; principle; types; stationary phases in gel chromatography; physical and chemical characteristics of gel, mechanism of gel permeation chromatography (GPC); instrumentation of GPC; applications of GPC- determination of molecular weight of polymer with numericals.</p> <p>2.8. Supercritical-Fluid Chromatography: introduction; important properties of supercritical-fluids; instrumentation and variables, SFC column vs other column, applications.</p>	
--	---	--

	3. Electrophoresis: 3.1. Theory of electrophoresis; Type of electrophoresis- Free solution and supporting medium electrophoresis, paper electrophoresis, capillary electrophoresis and gel electrophoresis. 3.2. Capillary electrophoresis-instrumentation, sample introduction in CE, types of CE methodology, electrophoretic mobility and electroosmotic mobility, total mobility, efficiency and resolution in CE column, numericals. 3.3. Gel electrophoresis - types of gel, Polyacrylamide gel electrophoresis PAGE, Agarose GE, factors affecting separation; 3.4. Staining and detecting electrophoresis band; 3.5. Separation of neutral molecule by MEKC; 3.6. Separation and determination of Vitamin B-complex by using CZE and MEKC.	6 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-504

Title of the Course: Spectral methods of analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
Course Objectives:	1. Introduction of various spectral methods for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
Course Outcomes:	1. Students should be in a position to understand theory and instrumentation of various spectral methods of analysis. 2. Understanding application of studied methods for qualitative and quantitative estimation at trace level.	
Content:	1. Automation of Analytical Method: An overview of automated system; definition; distinction between automatic and automated system; advantages and disadvantages by automation; types of automated techniques. Discrete and continuous automation, Introduction to Flow injection analysis.	5 hrs
	2. X-ray Absorption, Diffraction; Neutron Diffraction and Fluorescence Spectroscopy: Introduction; origin of X-rays; interaction of X-ray with matter; X-ray spectrometer; theory of X-ray absorption; X-ray diffraction by crystal; comparison of X-ray absorption with X-ray diffraction; Bragg's law; interpretation of X-ray diffraction powder pattern; calculation of lattice parameters; neutron diffraction introduction; theory; instrumentation and applications; X-ray fluorescence- introduction; applications. Introduction to Mossbauer spectroscopy; theory and application.	10hrs
	3. Molecular Fluorescence, Phosphorescence and Chemiluminescence Spectroscopy: Introduction; meaning of luminescence and chemiluminescence; principles of fluorescence, chemical structure and fluorescence; theory of molecular fluorescence; instrumentation- single and double beam filter fluorimeters, relationship between intensity of fluorescence and concentration; spectrofluorometer; phosphorimeter; factors influencing fluorescence and phosphorescence; basic differences in measurement of fluorescence and phosphorescence; advantages; limitations and precautions; selection of excitation wavelength for analysis; reporting fluorescence spectra; applications of fluorimetric analysis. Chemiluminescence: Introduction; principle; types; chemiluminescence with Luminol, instrumentation; measurement of chemiluminescence; quantitative chemiluminescence; Introduction to gas phase chemiluminescence analysis, chemiluminescence titrations and electro-chemiluminescence.	12hrs
	4. Microscopy: Chemical microscopy- microscope; parts and optical path; numerical aperture and significance; applications and qualitative and quantitative study;	9 hrs

	Electron microscopy- principle, operation, sample preparation, replicas, shadowing, application to analysis; electron probe analyzer, ion microscope; metallography- metallurgy, microscopic examination; specimen preparation and examination; interpretation of micrographs; SEM, TEM, AFM. Introduction to Magnetic resonance imaging (MRI) technique and Photo acoustic spectroscopy ; theory and applications	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-505

Title of the Course: Experiments in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses in Analytical Chemistry Practicals at MSc-I levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	1. Introduction of various experimental techniques for analysis. 2. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	1. Students should be in a position to use standardized material to determine an unknown concentration. 2. To gain experience with some statistics to analyse data in lab 3. Student should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p>This course consists of 7 units of experiments in various areas of Analytical chemistry. Minimum 14 experiments shall be carried out and at-least 2 experiments from each unit.</p> <p>UNIT 1: Analysis of Pharmaceutical Tablets/Samples</p> <ol style="list-style-type: none">1. Estimation of streptomycin in tablet sample by Maltol method2. Estimation of Ibuprofen / Paracetamol3. Estimation of sulphadiazine / sulphonamide4. Determination of moisture content in tablet powder by Karl Fischer titration <p>UNIT 2: Planar and column Chromatography</p> <ol style="list-style-type: none">1. Separation of alpha amino acids by paper chromatography and to study effect of mobile phase on resolution.2. Thin layer chromatography analysis of commercial available analgesic and to identify the active ingredients.3. Purification and determination of amount of paracetamol from commercial tablet by column chromatography4. Separation of a mixture of benzoin and benzil on silica gel column <p>UNIT 3: Ion exchange Chromatography and Solvent Extraction Method</p> <ol style="list-style-type: none">1. To determine the capacity of a cation exchange resin2. To separate organic mixture (acidic+basic+Neutral) by extraction3. To separation and estimate the zinc and nickel ions using an anion exchange resin4. To determine the Fe ion as Fe-oxine complex <p>UNIT 4: HPLC Analysis:</p> <ol style="list-style-type: none">1. HPLC analysis of benzaldehyde and benzyl alcohol using isocratic elution2. To study HPLC method development by using linear and stepwise gradient elution for binary system3. To analyze a mixture (benzene and toluene, anthracene and naphthalene) by Reverse phase-HPLC4. HPLC analysis of Analgesics in a commercial sample/tablet, Ibuprofen to develop and validate the analytical method of any one drug using HPLC	

	<p>UNIT 5: Gas Chromatographic Analysis:</p> <ol style="list-style-type: none"> 1. Quantitative analysis of a mixture of chloroform and carbon tetrachloride 2. Gas chromatographic analysis for a mixture of gases like O₂, N₂ and CO₂ <p>UNIT 6: Spectrophotometry Method:</p> <ol style="list-style-type: none"> 1. To determine pk value of methyl red indicator at room temperature 2. To determine the stoichiometry and stability constant of ferric salicylic acid complex by Job's method and mole ratio method 3. To determine the amount of each caffeine and benzoic acid from the soft drink by UV spectrophotometry. 4. To record UV absorption spectrum of acetone in n-hexane and in water to identify the various transition. <p>UNIT 7: Electrochemical Method:</p> <ol style="list-style-type: none"> 1. pH-metric determination of hydrolysis constant of aniline hydrochloride 2. pH-metric determination of the acid-base dissociation constant and isoelectric point of amino acid 	
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-501

Title of the Course: Bioanalytical and Forensic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the analytical chemistry at T Y B Sc (Chemistry) and M Sc part-I (Chemistry) levels.	
Course Objectives:	1. The purpose of this course is to provide basic understanding of medical laboratory clinical chemistry and forensic chemistry 2. Identify various types of evidence that may be collected at a crime scene including procedures for identification, collection, and analysis for the purpose of investigating and prosecuting crimes.	
Course Outcomes:	1. Apply principles of safety, quality assurance and quality control in clinical and forensic chemistry. 2. The students should be in position to select methods required for forensic and clinical sample analysis. 3. The students will be in a position to understand the principal and applications of various analytical methods used in clinical and forensic laboratory.	
Content:	1. Clinical Chemistry: 1.1. Composition body fluid; detection of abnormal levels of certain constituents leading to diagnosis of diseases; sample collection and preservation of physiological fluids; 1.2. analysis of physiological fluids- blood, urine and serum; estimation of blood glucose, cholesterol, urea, haemoglobin; urine-urea, uric acid, albumin, globulins, barbiturates, acid and alkaline phosphates;	7 hrs
	2. Human-nutrition: Estimation of enzymes, carbohydrates, essential amino acids, proteins and lipids.	4 hrs
	3. Food Analysis, Processing and Preservation: 3.1. Analysis of food such as milk, milk products, tea, coffee and beverages (soft drinks, alcoholic drinks), Flour, starch, honey, jams and edible oils. Analysis of preservatives, coloring matter, micronutrients. 3.2. Food processing and food preservation: Refining milling, canning, concentration, freezing Drying, pasteurisation sterilization irradiation.	8 hrs
	4. Forensic Science: Chemistry, Narcotics and toxicology 4.1. Narcotics and Psychotropic Substances Act: psychotropic substance; prohibition control; regulation offence and penalties. 4.2. Forensic Chemistry: Its role in crime; Types of cases received for Analysis; Procedures for sample selection, collection, preservation, identification. 4.3. Forensic chemical analysis of samples using classical and modern instrumental techniques: Analysis of alcohol and other spurious liquor, Examination of Petroleum products, Construction material for adulteration; Examination of burnt remains in arson cases; Analysis of dyes chemicals seized in crime; Types of explosives; commonly used explosives; their handling; analysis and	17hrs

	<p>identification of explosive residues.</p> <p>4.4. Narcotics: Definition; Narcotic drugs and Psychotropic; substances; Problems of drug abuse; drug addiction.</p> <p>4.5. Classification of Narcotic drugs;</p> <p>4.6. Identification of narcotic drugs by spot tests and other classical Methods for following drugs. (a) Narcotics- heroin and cocaine. (b) Stimulants- caffeine, amphetamines; (c) Depressants- Barbiturates, Benzodiazepines. (d) Hallucinogens- LSD</p> <p>4.7. Extraction of Narcotic drugs from different matrices; Isolation, purification, identification and estimation.</p> <p>4.8. Examination of Narcotic drugs using modern instrumental methods</p> <p>4.9. Toxicology: Definition; Its role in crime; Classification of poisons; commonly used poisons; signs and symptoms of poisoning; Sample collection, Handling and packing.</p> <p>4.10. Analytical Toxicology; Extraction of poisons from various matrices including visceral samples; Isolation; Purification identification and interpretation of findings. Use of both Classical and Modern Instrumental methods of chemical analysis of poisons.</p>	
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-502

Title of the Course: Calibration and Validation in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-2020

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques and statistical calculations related to topic. Knowledge of M.Sc.-Part I analytical courses is essential for better understanding of the course content	
Course Objectives:	1. Introduction of various aspect of calibration and validation 2. Study validation parameters and qualification of instrument	
Course Outcomes:	Students should be able to understand about calibration/validation and how it can be applied to industry and thus improve the quality of the products. The subject covers the complete information about basics of calibration & validation, types, methodology and application, the qualification of various equipment's and instruments.	
Content:	1. Calibration Significance of calibration in analytical chemistry. Standardizing methods; standards used, certified reference material. Blanks and controls; types and significance Statistical evaluation of analytical results; relative error, standard deviation, knowledge of q test, test of significance, linear Least Squares estimation and coefficient of regression Errors in calibration, Modes and protocols of calibration; External standard method, Standard addition method, Spiking, Internal standard method and standard bracket method. Introduction to common apparatus used in analytical laboratory and their calibration; volumetric glassware, Analytical Balances, pH meter, Oven and lab Refrigerator Excel-charts for calibration plot.	13 hrs
	2. Validation and qualification Introduction to validation, Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Validation and qualification, Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment. Regulatory requirements for analytical method validation International conference on harmonization (ICH) guideline Q2A Introduction to QA / QC, Safety Practices in a Chemical Laboratory	11 hrs
	3. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation	12 hrs

	Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-503

Title of the Course: Advanced Mass Spectrometry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. part-I (Chemistry) levels.	
Course Objectives:	1. Study of various theoretical concepts related to mass spectroscopic techniques. 2. Introduction of tandem mass spectrometry techniques. 3. Learning interpretational aspects of spectral data obtained from hyphenated techniques	
Course Outcomes:	1. Students should be in a position to understand principle behind different ionizations sources. 2. Students should be in a position to select mass analysers and ionization sources for analysis of particular type of analyte. 3. Students should be in a position to deduce structures of simple to moderately complex molecules/biomolecules by combining the spectral data obtained from hyphenated techniques.	
Content:	1. Introduction Mass spectrometry principle, general instrumentation, general interpretation procedure for mass spectra;	2 hrs
	2. Ionization methods: 2.1. Gas Phase ionization: electron ionization (EI), chemical ionization (CI), Field ionization and field desorption (FI, FD) 2.2. Particle Bombardment: Fast atom bombardment (FAB); Secondary ion mass spectrometry (SIMS) 2.3. Atmospheric pressure ionization: electrospray ionization (ESI), atmospheric pressure ionization (APCI) 2.4. Laser Desorption: MALDI 2.5. Inorganic ionization sources: thermal ionization; Spark source; Glow discharge, Inductively couple plasma (ICP)	10 hrs
	3. Mass analyzers: 3.1. Characteristics of analysers: nominal mass, mass accuracy, resolving power, resolutions, numericals to calculate nominal and accurate mass 3.2. Magnetic, electromagnetic and double focusing 3.3. Single Quadrupole and triple quadrupole 3.4. Time of flight analyser 3.5. Ion cyclotron resonance analyzer, 3.6. hybrid instrumentation 3.7. Detectors: electron multiplier, photon multiplier, Faraday cup (Note: instrumentation, working principles, characteristic features, advantages, practical consideration shall be discuss).	8 hrs
	3. Hyphenated Techniques: 3.1. Coupled techniques; Interface and their characteristic features; Importance of hyphenation of two analytical techniques; 3.2. Introduction and instrumentation of following techniques: GC-FTIR, GC-MS, LC-MS, MS-MS (tandem) mass spectrometry (use of	8 hrs

	<p>stable isotopes), ICP-MS, TG-MS.</p> <p>3.3. Analysis of chromatogram obtained from hyphenated techniques: Total ion chromatogram (TIC), Extracted Ion chromatogram (XIC).</p> <p>4. Tandem Mass spectrometry applications:</p> <p>4.1. Pharmacokinetic studies: Fate of drug in living organisms, metabolite identification, biotransformation of ziprasidone</p> <p>4.2. Tandem MS and fragmentation pattern of following drugs: Paracetamol, 2-mercaptopyruvic acid, Sulfasalazine, Narcotics-amphetamine,</p> <p>4.3. Analysis of biomolecules-Protein and peptides: structure and sequence determination using fragmentation, solve problems based on MS/MS data.</p>	8 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the Concepts in Analytical Spectroscopy), Analytical techniques at MSC Semester I and II so as to have basic knowledge of environmental chemistry and instrumental analysis.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction to environmental application of chemistry 2. Studying pollution from chemical perspective. 3. Creating awareness about environmental acts of India 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Develop social concern for pollution based on various chemical process 2. Evaluate the use of various analytical techniques in environmental control and monitoring 	
Content:	<p>1. Water pollution</p> <ol style="list-style-type: none"> 1.1 Constituents of aquatic life 1.2 Nature and types of water pollutants: heavy metals, inorganic pollutants, organic pollutants, pesticides, soaps and detergents, radioactive pollutants; Water standards in India [IS 10500 (2012)] 1.3 Soaps and detergents pollutants: Analysis of Soaps and detergents, general scheme of analysis, active ingredients, Test for soap (fatty acid salts), test for synthetic detergents 1.4 Municipal water treatment 1.5 Treatment of water for industrial use 1.6 Water conditioning: principle of coagulation and flocculation, softening, disinfection, demineralisation, fluoridation, chlorination, ozone treatment, electrodialysis 1.7 Wastewater treatment: pH, aerobic and anaerobic water treatment 1.8 Mercury pollution and estimation of organomercurials; 1.9 Analysis of: Dissolved oxygen (polarography and oxygen electrode), Chemical oxygen demand, Biochemical oxygen demand; 1.10 case study -DDT, Kepone, Minamata (any other) <p>2 Air pollution</p> <ol style="list-style-type: none"> 2.1 Introduction to atmospheric chemistry 2.2 Photochemical processes (ozone depletion) 2.3 Chain reactions in atmosphere 2.4 Oxidation process in atmosphere 2.5 Acid-base reaction in atmosphere 2.6 Sources and sinks of air pollutants 2.7 Effect of air pollutants on living and non-living things 2.8 Methods for sampling air pollutants 2.9 Air pollution problems- world and India 2.10 Sources -analysis control of: oxides of carbon, nitrogen and sulphur, H₂S 2.11 Organic compounds in atmosphere 2.12 Air act of India 1981 2.13 Greenhouse gases and global warming 2.14 Radioisotopes in air 2.15 Methods to monitor and control air pollution: scrubbers, filters, gravity and cyclone separators, absorption, adsorption, condensation, 	<p>10 hrs</p> <p>10 hrs</p>

	<p>flare tower, gas sensing</p> <p>2.16 Noise pollution</p> <p>2.17 Case study-Bhopal gas tragedy, nuclear disasters-Chernobyl and Fukushima</p> <p>3 Soil pollution</p> <p>3.1 Soil macrostructure and microstructure,</p> <p>3.2 Micro and macronutrients of soil</p> <p>3.3 Inorganic and organic matter in soil</p> <p>3.4 Reactions in soil</p> <p>3.5 Fertilisers in soil; Analysis of fertilizer (N, P, K)</p> <p>3.6 Excessive use of agrochemicals</p> <p>3.7 Waste and pollutants in soil</p> <p>3.8 Type of pesticides, degradation of pesticides in soil (chemical, photochemical biochemical), Analysis of pesticides,</p> <p>3.9 Soil pollution Sources, prevention and control</p> <p>3.10 Biochemical effects of pesticides; analysis of pesticides</p> <p>3.11 Plastic pollution</p> <p>3.12 Municipal garbage treatment</p> <p>4. Instrumental Techniques in environmental chemical analysis.</p> <p>4.1 Neutron activation analysis</p> <p>4.2 Anodic stripping voltammetry, (Mixture: Cu, Pb, Zn, Cd)</p> <p>4.3 atomic absorption spectroscopy, (Cu, Co, Cr)</p> <p>4.4 Flameless atomic absorption, (Hg, Pb,)</p> <p>4.5 Inductively-coupled plasma-emission spectroscopy (B,W)</p> <p>4.6 X-ray fluorescence</p> <p>4.7 Infrared and non-dispersive infrared spectroscopy (nitrates, carbonate, CO)</p> <p>4.8 Chemiluminescence (NO_x)</p> <p>4.8 Gas and liquid chromatography(NO_x, CO, CO₂, VOC)</p> <p>4.9 Ion-selective electrodes, (F, Ag, S, Ca)</p> <p>4.10 Ion chromatography-(mixture: Ni, Co and Cu; chloride, nitrate and sulphate)</p> <p>Above techniques shall be discussed with minimum one environmental application</p>	<p>8 hrs</p> <p>8 hrs</p>
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-505

Title of the Course: Problems on combined Spectroscopy

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Study of various theoretical concepts related to organic spectroscopic techniques. 2. Introduction of commonly used 2D NMR techniques. 3. Learning interpretational aspects of spectral data pertaining to IR, PMR, CMR and MS.	
Course Outcome	1. Students should be in a position to deduce structures of simple to moderately complex molecules by combining the spectral data obtained using two or more spectral techniques. 2. Students should be in a position to apply various concepts in organic spectroscopy (PMR, CMR, MS and 2D NMR) and generate/ predict PMR, CMR, MS and 2D NMR spectral data based on given structures of simple molecules.	
Content:	1. Electronic and Infrared Spectroscopy: basic concepts; Application of electronic and IR spectroscopy in structural elucidation of organic compounds	04 hrs
	2. NMR Spectroscopy: Theory of Nuclear magnetic resonance, quantum description of NMR, classical description of NMR, Types of NMR spectra, environmental effects of NMR Spectra, the chemical shift, Applications of proton NMR in qualitative and quantitative analysis (in general).	05 hrs
	3. ^{13}C –NMR spectroscopy: Introduction, proton coupled and proton decoupled ^{13}C - spectra. Off- resonance decoupling, APT & DEPT techniques; ^{13}C chemical shifts – factors affecting the chemical shifts – Homonuclear (^{13}C - ^{13}C J) and heteronuclear (^{13}C – ^1H , ^{13}C – ^2H J) couplings.	06 hrs
	4. Two-dimensional NMR spectroscopy: Introduction to 2D-NMR, Classification of 2D experiments- 2DJ resolved spectroscopy; interpretation of spectra of simple organic compounds using following 2D-NMR techniques-COSY, NOESY, HSQC, HMQC, HMBC, TOCSY and INADEQUATE	07 hrs
	5. Identification of organic compounds using combined spectral methods: UV, IR, PMR, CMR, 2D NMR, Mass <i>(Note: More emphasis shall be given for solving combined spectroscopic data for structural elucidation)</i>	14 hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/	

	presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-506

Title of the Course: Chemometrics

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Introduction of various chemistry software used in quantification and calculations 2. Study validation parameters and qualification of instrument	
Course Outcome	Students should be able to understand about various software in chemometric and how it can be applied to analysis and thus improve the quality of the products. The subject covers the complete information about software and their application in quantifications.	
Content:	<p>1. Introduction to Data and Statistics: Introduction; Univariate Statistics Review, Probability, Variance and Sampling, Linear Regression and Calibration Data, Digitization, and the Nyquist Theorem, Detection Limit, S/N ratio, and Signal Filtering; Review of Linear Algebra: Scalars, Vectors, and Matrices, Matrix Notation and Matrix Operations Orthogonality, Analysis of Variance (ANOVA) - 1 Variable, Analysis of Variance - 2 Variables; Introduction to MatlabTM: Program Basics and Layout, Matrix Operations in MatlabTM The Diary Command and Examples, ANOVA in MatlabTM; Experimental Design: Factorial Design, Simple <i>versus</i> Complex Models, Factorial Design in MatlabTM ; Half-Factorial Design.</p> <p>2. Multivariate Methods I: Introduction to various multivariate methods; the Six Habits of a Chemometrician; Principle Component Analysis (PCA); data pretreatment- Mean Centering and Normalization; PCA in MatlabTM.</p> <p>3. Multivariate Methods II: Classical Least Squares (CLS), CLS in MatlabTM; Inverse Least Squares (ILS).</p> <p>4. Multivariate Methods III: Multiple Linear Regression (MLR); Principle Component Regression (PCR); Partial Least Squares, Examples in MatlabTM; Summary of Multivariate Methods; Pattern Recognition- Supervised versus Unsupervised Pattern Recognition, K Nearest Neighbours (KNN); Soft Independent Modelling for Chemical Analysis(SIMCA), Summary of Pattern Recognition.</p> <p>5. Computers in Chemistry: The students shall learn how to operate a PC and run standard programs and packages like MS-WORD, EXCEL, ORIGIN, SIGMA PLOT, and CHEM SKETCH; to solve Chemistry numerical (numerical taken preferably from Physical Chemistry for plotting first and second derivative curves, linear plots); numerical from Analytical Chemistry, Chemical Kinetics, Electrochemistry, Spectroscopy and other related topics; writing the structures of inorganic and organic molecules, chemical equations and other</p>	<p>10 hrs</p> <p>05 hrs</p> <p>04 hrs</p> <p>07 hrs</p> <p>10 hrs.</p>

	interesting applications will be taught.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

M Sc-II Inorganic chemistry
Semester III and IV Courses (Academic year 2019-2020 onwards)

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits
ICC 501	Coordination and organometallic Chemistry	3	ICO 501	Bioinorganic Chemistry	3
ICC 502	Materials Chemistry	3	ICO 502	Catalysis: The Basic Chemical concepts	3
ICC 503	Group Theory and Spectroscopy	3	ICO 503	Chemistry of P-Block Elements	3
ICC 504	Selected Topics in Inorganic Chemistry - I	3			
ICC 505	Experiments in Inorganic Chemistry	3	General Optional Courses		
			CGO-500	Dissertation	8
			CGO-501	Selected Experiments in Chemistry	8

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-501

Title of the Course: Coordination and organometallic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To make understand the electronic structure of compounds of d-block elements.2. To provide sufficient knowledge of CFT and MOT in coordination and organometallic compounds.3. To understand interpretation of magnetic and electronic properties of coordination compounds.4. To understand fundamental concepts of inorganic chemistry reaction mechanisms5. To provide knowledge on applications of organometallic compounds in homogenous catalysis.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the electronic structure of coordination and organometallic compounds.2. They will be well equipped with knowledge of CFT and MOT3. They will be in position to understand the magnetic and electronic properties.4. The concepts of inorganic reactions will be clear to them.5. They will know the applications of organometallic compounds in industries	
Content:	<p>1. Electronic structure of coordination compounds:</p> <p>1.1 Crystal field theory and its applications: a) Octahedral compounds; b) tetrahedral compounds; c) square-planar compounds and other geometries; d) tetragonally distorted compounds (Jahn-Teller Effect); e) octahedral vs tetrahedral</p> <p>1.2 Ligand field theory: a) σ bonding; b) π-bonding</p> <p>2. Magnetic Properties coordination compounds</p> <p>a) diamagnetism, b) paramagnetism; c) ferromagnetism, d) antiferromagnetism, d) temperature dependence magnetism; Curie law, Curie-Weiss Law.; e) spin cross over phenomenon</p> <p>3. Spectra of coordination compounds</p> <p>3.1 Electronic structure of atoms: a) spectroscopic terms; b) classification of microstates and energies of the terms; d) Racah parameters</p> <p>3.2 Electronic spectra: a) ligand field transitions; b) selection rules; c) spectroscopic terms of complexed ion; d) correlation and Orgel diagrams; d) Tanabe-Sugano diagrams; e) Charge-Transfer bands: LMCT transitions and MLCT transitions; f) Luminescence</p> <p>4. Inorganic reaction mechanisms:</p> <p>4.1 Substitution reactions in coordination compounds; b)</p>	<p>8 hr</p> <p>2 hr</p> <p>8 hr</p> <p>8 hr</p>

	<p>thermodynamic considerations; c) kinetic considerations; d) substitution reactions in octahedral compounds; e) substitution reactions in square planar compounds.</p> <p>4.2 Electron transfer reactions: inner sphere and outer sphere mechanism, Frank Condon principle, Marcus equation</p> <p>5. Organometallic compounds and reactions Significance of 18 electron rule, metal carbonyls & nitrosyls, reactions of organometallic compounds, metal centered catalysis in complex compounds, homogenous catalysis such as hydrogenation, hydroformulations, coupling reactions and isomerization of alkanes. Asymmetric catalysis, stereochemically rigid molecules.</p>	10 hr
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICC-502

Title of the Course: Materials Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICC-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of Materials Chemistry	No. of Hours
Course Objective:	To provide basic and advanced knowledge about solid state chemistry	
Course Outcome	This course will give sufficient information about the preparation of different types of materials, their structures, reactivity and properties.	
Content:	1. Introduction to Materials chemistry 2. Structure and bonding in solid materials: Crystal lattice; unit cell; Miller indices and planes; X-ray diffraction method; metallic, covalent and ionic solids; structural classification of binary and tertiary compounds. 3. Non-stoichiometry in material solids: Oxygen deficient oxides, metal deficient oxides and classification of non-stoichiometry. 4. Crystal defects: Types of defects: Point defects; Dislocations: Line defects and Plane defects 5. Materials preparation techniques: I) Ceramic method II) Different wet chemical methods: A) For Powder materials: Co-precipitation, Precursor, Combustion, Sol-gel, Spray roasting, Freeze drying. B) For Single crystals: i) Growth from melt ii) Flux method iii) Epitaxial growth of single crystal thin films: Chemical and Physical methods iv) Chemical vapour transport v) Hydrothermal method vi) Dry high pressure method. C) For Amorphous Materials D) For Nanomaterials 6. Reactivity of Solid Materials: Tarnish reactions, decomposition reaction, solid-solid reactions, addition reactions, double decompositions reaction, electron transfer reaction, solid-gas reactions, sintering, factors influencing reactivity of solids. 7. Phase Transformations in Solid Materials: Thermodynamic consideration, structural change in phase transformation, Martensite transformation, temperature and pressure induced transformations, order- disorder transitions,	1 hr 4 hr 2 hr 3 hr 7 hr 3 hr 3 hr

	<p>electronic transition, transformation with a change in composition.</p> <p>8. Electrical Properties: Electrical conductivity, free electron theory, fermi energy, insulators, semiconductor and conductors, band theory of semiconductor, Brillouin zones, Hall effect, the Seebeck effect, Superconductivity, BCS theory, Meissner effect, high temperature superconductor.</p> <p>9. Semiconductor Devices: Diodes, transistors and Junction field effect transistor, light meter, photodiode, phototransistor, solar cells, light emitting diodes, laser materials.</p> <p>10. Optical and dielectric properties: Luminescence and phosphorescence, piezoelectric, ferroelectric materials and applications.</p> <p>11. Magnetic properties: Introduction to magnetism, behaviour of substance in a magnetic field, magnetic moments, diamagnetism, paramagnetism, experimental determinations of susceptibility, ferromagnetism, anti-ferromagnetism and ferrimagnetism.</p>	<p>4 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p>
Pedagogy:	Lectures/ tutorials/ self-study or a combination of some of these.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-504

Title of the Course: Selected topics in inorganic chemistry - I

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To gain knowledge in selected topics in inorganic chemistry.2. To learn s-block elements, selected compounds of d-block and f-block elements.3. To understand the basic electrochemical processes in inorganic compounds.4. To study the applications of inorganic compounds in selected areas.	
Course Outcomes:	<ol style="list-style-type: none">1. Students will be able to gain knowledge regarding chemistry (abundance, preparation, properties) of s, d and f block elements.2. Students will be able to gain knowledge of fundamentals of inorganic electrochemistry and medicinal chemistry.	
Content:	<p>1. S-block elements and their compounds</p> <p>1.1 Hydrogen and hydrides: Electronic structure, position in periodic table, abundance, preparation, properties, isotopes, ortho and para hydrogen. Classification of hydrides, preparation & properties of hydrides; hydrogen ion, hydrogen bonding and its influence on properties.</p> <p>1.3 Group 1 Elements: Introduction, abundance, extraction, physical and chemical properties, solubility and hydration, solutions of metal in liquid ammonia, complexes, crowns and cryptands, electrides, alkalides, difference between lithium and the other group 1 elements, diagonal relationship between Li and Mg.</p> <p>1.4 Group 2 Elements Introduction, abundance, extraction, physical and chemical properties, solutions of metal in liquid ammonia, complexes, anomalous behaviour of beryllium, difference between beryllium and the other group 2 elements, diagonal relationship between Be and Al, preparation and properties Grignard reagent.</p> <p>2. Chemistry of d-block and f-block compounds</p> <p>2.1 Polyoxometallates; 1.2 metal sulphides and sulfido compounds; 1.3 Nitrido & alkylidyne compounds; 1.4 Metal-metal bonded compounds and clusters; 1.5 coordination & organometallic compounds of lanthanides; 1.6 Electronic spectra of lanthanides & actinide compounds; 1.6 Brief chemistry of thorium, uranium, neptunium, plutonium &</p>	<p>10 hr</p> <p>6 hr</p>

	<p>americium.</p> <p>3. Fundamentals of Inorganic Electrochemistry Basic aspects of electrochemistry, electron transfer reactions at electrode surface, potential and electrochemical cells, voltammetric techniques, linear voltammetry, cyclic voltammetry; reversible, irreversible and quasi-reversible processes; applications of cyclic voltammetry with reference to ferrocenes, transition metal complexes.</p> <p>4. Inorganic medicinal chemistry Anticancer agents: Platinum and Ruthenium complexes as anticancer drugs, Cancer chemotherapy, phototherapy, radiotherapy using borane compounds, Chelation therapy, Gadolinium and technetium complexes as MRI contrast agents, X-ray contrast agents, Anti-arthritis drugs, Anti-bacterial agents (Ag, Hg, Zn and boron compounds), Antiseptic and anti-biotic, Deodorants and anti-perspirants, Anti-viral agents (influenza, herpes, hepatitis and HIV viruses), Li drugs.</p> <p>5. Nuclear Chemistry Radioactivity, Decay processes and decay energy, half-life of radioactive elements, Nuclear fission and fusion processes, Nuclear reactor components and functions, Q values for nuclear reactions, Nuclear waste management, Radiation detection principles, Chemical separation techniques of radioactive elements, Radio-analytical techniques, Activation analysis.</p>	<p>4 hr</p> <p>8 hr</p> <p>8 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II Inorganic Chemistry

Course Code: ICC-505

Title of the Course: Experiments in Inorganic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses ICC-401, ICC-402 and ICO-401 at M. Sc.-I level	No. of lectures
Course Objectives:	1. To introduce to practical knowledge in Inorganic Chemistry. 2. To learn techniques of crystallization of ligands and synthesis of coordination compounds 3. To learn characterization of compounds using different instruments 4. To provide experience of synthesis and characterization of materials 5. To introduce analysis of ores for metal content	
Course Outcomes:	1. Students will be in a position to understand general aspects involved in purification of ligands and synthesis of coordination of compounds 2. Students will be able to understand the methods for characterization of coordination compounds. 3. Students will be in a position to understand the solid state material synthesis and characterization. 4. Students will be able to separate metal ions by ion exchange chromatography. They will also gain knowledge about the analysis of ores and alloys	
Content:	<p>EXPERIMENTS IN INORGANIC CHEMISTRY <i>Total sixteen experiments to be performed from the following.</i></p> <p>Group – 1: Experiments in coordination chemistry: Ligand and complex synthesis, metal analysis (Minimum 3)</p> 1) Purification (distillation / recrystallization) of ligands like acacH, en, carboxylic acids etc) 2) Preparation of manganic tris(acetylacetonate) and estimation of manganese 3) Preparation of tris(thiourea) copper(I) sulfate and estimation of copper 4) Preparation of isomers; <i>cis</i> & <i>trans</i> dichloro-(ethylenediamine)-cobalt(III) chloride and estimation of cobalt 5) Preparation and resolution of tris(ethylenediamine)cobalt(III) ion and estimation of chloride 6) Preparation of <i>cis</i> and <i>trans</i> - potassium dioxalatodiaquo-chromate(III) and estimation of chromium 7) Preparation of nitro and nitrito-penta aminecobalt(III)chlorides and estimation of cobalt 8) IR spectral characterization of free ligands and coordinated ligands	18

	<p>9) Single crystal structure analysis <i>NOTE: In complex synthesis, the student is expected to recrystallize the product, record IR spectra and carry out metal analysis. Spectral analysis can be carried over.</i></p> <p>Group –2 Experiments in Solid State Chemistry (Minimum 3) 1) Preparation of spinel oxides by precursor method and estimation of metals in precursors and oxides, 2) Characterization of precursors by thermal analysis and infrared analysis 3) X-ray diffraction studies of oxides 4) Electrical characterization: i) Direct current electrical resistivity of semiconductor (Ge/Si) by Four Probe 4) Curie temperature determination of dielectric material (PZT) by measurement of dielectric constant v/s temperature 5) Measurement of magnetization parameter: M_s, M_r and H_c, 6) Determination of Curie temperature of magnetic oxides by A.C. susceptibility studies.</p> <p>Group – 3: Instrumental methods / spectral analysis / ion exchange (Minimum 3) A) Determination of stability constant of complex ions in solution 1) Fe(III) – thiocyanate compound B) Determination of instability constant of complex ions in solution 2) Determination of instability constant for the reaction between Ag^+ and NH_3 3) Determination of instability constant for the reaction between Ag^+ and en 4) Determination of instability constant for the reaction between Cu^{2+} and NH_3 5) Determination of instability constant for the reaction between Cu^{2+} and en C) Ion exchange chromatography 6) Separation of Mg^{2+} and Co^{2+}/Zn^{2+} by anion exchange column 7) Separation of transition metal cations by anion exchange column</p> <p>Group – 4: Ore / Alloy/ commercial sample analysis (Minimum 3) 1) Analysis of Goan Iron ore: Hematite / magnetite 2) Analysis of Devardas alloy 3) Analysis of Solder (Pb and Sn) 4) Analysis of Calcite/ Dolomite 5) Analysis of Pyrolusite 6) Analysis of Nickel-Aluminium alloy 7) Analysis of Brass / Bronze</p>	<p>18</p> <p>18</p> <p>18</p>
Pedagogy	Pre-labs, practical / self-study or a combination of some of these could also be used to some extent.

Programme: **M. Sc. Part-II (Inorganic Chemistry)**

Course Code: **ICO-501**

Title of the Course: **Bioinorganic Chemistry**

Number of Credits: **03**

Effective from AY: **2019-20**

Prerequisites for the course:	The students who have done MSc-I Chemistry core courses are eligible to attend	No. of lectures
Course Objectives:	1. To introduce, describe and highlight the role of inorganic elements especially metal ions in biology. 2. To describe the role of small molecular weight model compounds.	
Course Outcomes:	In addition to knowing the essential elements in biology the students will be able to understand the role played by metal ions in vital processes like i) oxygen storage and transport and ii) electron transfer.	
Course Content:	1. Essential elements in biology, distribution of elements in biosphere, bio-availability, bio-stability, building blocks of the biosphere; carbohydrates, nucleic acids and proteins, Biological importance of water, and brief review of the chemistry of biopolymers. Metallobiomolecules: classification of metallobiomolecules, metalloproteins (enzymes), metal activated proteins (enzymes), metal functions in metalloproteins, Principles of coordination chemistry related to bioinorganic research, physical methods in bioinorganic chemistry	6 hr
	2. Introduction, biological importance of the alkali and the alkaline earth cations, Cation transport through membranes (ion pumps). Photosynthesis, Hill reaction, Chlorin macrocycle and chlorophyll, Absorption of light by chlorophyll, role of metals in photosynthesis, in vitro photosynthesis.	6 hr
	3. Non redox metalloenzymes, zinc metalloenzymes like carboxypeptidase, carbonic anhydrase and alcohol dehydrogenase, Bio-functions of zinc enzymes, active site structure and model complexes.	6 hr
	4. Biochemistry of a few transition metals viz. Fe, Mo, Cu and Ni, Oxygen carriers and oxygen transport proteins, iron porphyrins (Haemoglobin and myoglobin). Haemocyanins and Haemerythrins, Synthetic models for oxygen binding haemproteins. cytochrome 'c', catalase peroxidase, and superoxide dismutase, blue copper proteins, vitamin B ₁₂ coenzymes, nitrogen fixation and iron-sulfur proteins, biological nitrogen fixation, nitrogenase and dinitrogen complexes, iron-sulfur proteins, synthetic analogues for Fe-S proteins, core extrusion reactions.	6 hr 6 hr

	<p>5. Metal transport and storage: A brief review of iron transport.</p> <p>6. Synthesis of simple ligands or isolation of S-containing amino acid or extraction of chlorophyll from green leaves (this will involve both collection of synthetic procedures from library, term paper presentation / discussion)</p>	
Pedagogy	Mainly lectures / tutorials / assignments /group discussion / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICO-502

Title of the Course: Catalysis: The Basic chemical concepts

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with Chemistry back ground are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To understand fundamentals concepts of chemical reactions over the catalysts.2. To understand energy saving and making green processes in chemical reactions.3. To understand fundamentals concepts of chemical reactions for developing higher productivity, mechanisms and viability.4. To provide knowledge on applications of heterogeneous, homogenous and other catalytic processes.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the green chemical processes.2. They will be well equipped with the knowledge of catalytic reactions.3. They will be in position to understand the reaction mechanism process.4. The concepts of catalytic reactions will be cleared to them.5. They will know the applications of catalyst compounds in chemical reactions and industries.	
Content:	<p>1. Origin and development of catalysis; Difference between heterogeneous, homogeneous, auto and photocatalysis, Importance of heterogeneous and homogeneous catalysts in chemical reactions.</p> <p>2. Heterogeneous Catalysis:</p> <ol style="list-style-type: none">i. Adsorptions: Physical and chemical adsorption, dissociative adsorptions, simple adsorptions isotherm, Langmuir adsorption and the BET adsorption isotherm.ii. Types of Catalysts; Preparations of the Catalysts, nano-materials, significance of zeolites and supported catalysts.iii. Characterization of solid catalysts: Surface area, structure and surface morphology, X-ray diffraction, SEM, TEM, X-ray absorption spectroscopy, XPS and Auger spectroscopy to surface studies.iv. Activity and life of the catalysts, active centers, promoters and poisons, catalyst deactivations.v. Heterogeneous reactions: Thermodynamic consideration in surface reactions, ammonia synthesis, oxidation reduction reactions (selected examples), mechanism of catalytic reactions, method of finding rate of the reactions and the rate determining steps.vi. Theories of Catalysis: Boundary layer theory, Catalysis by semiconductors, Wolkenstein theory, Balancing's approach,	<p>2 hr</p> <p>17 hr</p>

	<p>electronic factors is catalysis by metals.</p> <p>3. Homogeneous Catalysis: Intermediate stages in homogenous Catalysis, energy profile diagram, general scheme for calculating kinetics of reactions, decomposition of hydrogen peroxide, acid-base catalysis, hydrogenation, Mosanto acetic acid, Carboxylation reaction and Wacker reaction.</p> <p>4. Introduction to followings: Photocatalysis, catalytic polymerizations, phase transfer catalysis and biocatalysis with suitable examples.</p> <p>5. Catalysts for energy and environmental: Catalytic gasification, steam reforming, fuel cells and auto-industrial emission control.</p>	<p>7 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICO-503

Title of the Course: Chemistry of P-Block Elements

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICO-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of P-Block Elements	No. of Lectures
Course Objective:	To provide basic and advanced knowledge about P-Block elements, their compounds and complexes.	
Course Outcome	This course will give sufficient information about the periodic table in general and P-Block elements and their compounds in particular.	
Content:	1. General trends of different properties in groups and periods in periodic table 2. Chemistry of Group 13 Elements and their Compound 2.1 Introduction, physical properties, chemical reactions with oxygen, nitrogen, sulphur, halogens, HCl, NaOH, NH ₃ , mono-di-tri-chlorides, alums, organo-compounds of B and Al, difference between boron and other Gr. 13 elements, diagonal relationship. 2.2 Preparation, bonding and structure of diborane, higher boranes, borane anions, carboranes and metallocarboranes. 3. Chemistry of Group 14 Elements and their Compound 3.1 Introduction, physical properties, compound of Gr.14: Oxides, di & tetra halides, hydrides, sulphides, complexes of Gr. 14, organosilicon compounds (except silicones), cluster compounds of Ge, Sn and Pb. 3.2 Carbon dating, graphene, metallocarbohedrenes, freons. 4. Chemistry of Group 15 Elements and their Compound 4.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides; 4.2 Preparation, properties and structure of Phosphorous: Oxides, oxyacids, sulphides, oxosulphides; organophosphorous compounds. 4.3 Classification, preparation, properties and structures of phosphazenes. 5. Chemistry of Group 16 Elements and their Compound 5.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides, oxides (except sulphur), oxyacids (except sulphur), classification of oxides. 5.2 Polyatomic sulphur cations, anionic polysulphides, compounds with sulphur as a ligand.	2 hr 9 hr 5 hr 5 hr 6 hr

	<p>6. Chemistry of Group 17 Elements and their Compound</p> <p>6.1 Introduction, physical properties; preparation, properties and structure of: Oxides, oxyacids, halides, oxohalides, hydrogenoxide fluorides and related compounds.</p> <p>6.2 Preparation, properties and structure of: Polyhalide anions, polyhalonium cations, halogen cations.</p> <p>7. Chemistry of Group 18 Elements and their Compound</p> <p>7.1 Introduction, physical properties; preparation, properties and structure of xenon compounds (fluorides and oxides); organoxenon compounds, coordination compounds.</p> <p>7.2 Preparation, properties and structure of compounds of other noble gases.</p>	<p>6 hr</p> <p>3 hr</p>
Pedagogy:	Mainly lectures/ tutorials/ assignments /seminars/ presentations/ self-study or a combination of some of these could be used to some extent. Sessions shall be fractionally interactive in nature.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-502

Title of the Course: Reaction Mechanisms, Stereochemistry and Asymmetric Synthesis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry at T Y B Sc (Chemistry) and M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction to important principles of stereochemistry such as Baldwin's rules.2. Understand the importance of chirality in organic syntheses.3. Learn about non-catalytic asymmetric synthesis methods in the classical chemistry involving alkenes and carbonyl compounds.4. Analyse and understand mechanistic aspects for fundamental reactions studied at TYBSc/ MSc Part I levels.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in position to understand the importance of asymmetric synthesis in organic reactions.2. Students should be in position to understand to apply various principles of stereochemistry and understand the mechanistic aspects of fundamental reactions.	
<u>Content:</u>	<p>I. Reaction Mechanisms-</p> <p>1. Intramolecular Reactions (Baldwin's Rules)</p> <p>2. Molecular rearrangements and their synthetic applications</p> <p>2.1 Unifying principles and mechanisms of rearrangements taking place at an electron deficient and electron rich substrates.</p> <p>2.2 Rearrangements taking place at carbon: Arndt Eistert, Wagner Meerwein, benzil-benzilic acid, Pinacol, semipinacol, Tiffeneau Demjanov, dienone phenol, Wittig, Favorskii, Stevens, Wolff, Baker-Venkatraman rearrangement, Barton decarboxylation, Pummerer rearrangement.</p> <p>2.3 Rearrangements at nitrogen: Hofmann, Curtius, Lossen, Schmidt, Beckmann, Neber, Stieglitz rearrangement.</p> <p>2.4 Rearrangements at oxygen: Payne (including aza and thia Payne) rearrangement, hydroperoxide rearrangement, Criegee rearrangement.</p> <p>2.5 Aromatic rearrangements: Benzidine, Fries, Von Richter, Sommelet-Hauser, Smile's, Jacobsen. Rearrangement on aniline derivatives- Bamberger rearrangement, Fischer-Hepp, Orton, Hofmann-Martius,</p>	<p>02 hours</p> <p>07 hours</p>

	<p>Reilly-Hickinbottom, rearrangements of N-arylazoanilines, Phenylnitramines, Phenylsulfamines.</p> <p>2.6 Rearrangements involving fragmentations: Eschenmoser fragmentation.</p> <p>II Stereochemistry</p> <p>1.1 Stereoselectivity in cyclic compounds</p> <p>(1) Introduction</p> <p>(2) Stereochemical control in six membered rings</p> <p>(3) Reactions on small rings</p> <p>(4) Regiochemical control in cyclohexene epoxides</p> <p>(5) Stereoselectivity in bicyclic compounds</p> <p>1.2 Conformations, stability and reactivity of fused ring compounds</p> <p>1.2.1 Fused bicyclic systems with small and medium rings:</p> <p>(1) Bicyclo [4.4.0] decanes (cis- and trans-decalins)</p> <p>(2) cis- and trans- decalones and decalols</p> <p>(3) Octahydronaphthalins (octalins)</p> <p>(4) Bicyclo [4.3.0] nonane (cis- and trans-hydrindanes)</p> <p>1.3 Fused polycyclic systems</p> <p>(1) Perhydrophenanthrenes</p> <p>(2) Perhydroanthracenes</p> <p>(3) Perhydrocyclopentenophenanthrene system (steroids, triterpenoids and hormones). Conformations and reactivity towards esterification, hydrolysis, chromium trioxide oxidation, ionic additions (of X_2) to double bonds, formation and opening of epoxide ring, epoxidation by peroxy acids.</p> <p>1.4 Spirocyclic compounds</p> <p>1.5 Reactions with cyclic intermediates or cyclic transition states</p> <p>2. Conformation of bridged ring compounds</p> <p>2.1 Bicyclo [2.2.1] heptane (norbornane)</p> <p>(1) Geometry and topic relationship of hydrogens.</p> <p>(2) Solvolysis of bicyclo[2.2.1]heptyl systems, formation, stability and reactivity of norbornylcation.</p> <p>(3) Relative stability and the rate of formation of <i>endo</i> and <i>exo</i> isomers in both bornane and norbornane systems.</p> <p>2.2 Bicyclo [2.2.2] octane system</p> <p>(1) Geometry and topic relationship of hydrogens</p> <p>(2) Solvolysis of bicyclo[2.2.2]octyl system.</p> <p>2.3 Other bridged ring systems: starting from bicyclo[1.1.1]pentane to bicyclo[3.3.3] undecane</p> <p>2.4 Bicyclo system with heteroatom: the relative stabilities of</p>	<p>8 hours</p> <p>4 hours</p>
--	--	-------------------------------

	<p>tropine, pseudotropine and benzoyl derivatives of norpseudotropine.</p> <p>3. Dynamic Stereochemistry: Stereoselective Reactions</p> <p>3.1 Stereoselectivity: classification, terminology and principle. Selectivity in chemistry– substrate and product selectivity.</p> <p>3.2 Stereoselective reaction of cyclic compounds: Introduction, reactions of four, five and six-membered rings. Conformational control in the formation of six-membered ring.</p> <p>3.3 Diastereoselectivity: Introduction, making single diastereoisomers using stereospecific reactions of alkenes.</p> <p>3.4 1,2-Addition to carbonyl compounds: Predicting various addition outcomes using different predictive models such as, Cram Chelate, Cornforth, Felkin-Anh. Specific reactions: allylation/crotylation by Brown, Roush, BINOL catalyzed.</p> <p>3.5 Stereoselective reaction of acyclic alkenes: The Houk model</p>	6 hours
	<p>4. Asymmetric synthesis</p> <p>4.1 Chiral pool (chiron approach)</p> <p>4.2 Chiral auxiliary approach Oxazolidinone & norephedrine-derived chiral auxiliary controlled Diels-Alder reaction and alkylation of chiral enolates and aldol reaction, Alkylation using SAMP and RAMP</p> <p>4.3 Chiral Reagents (Use of (-)-sparteine)</p> <p>4.4 Asymmetric catalysis CBS catalyst, Ruthenium catalyzed chiral reductions of ketones, Catalytic asymmetric hydrogenation of alkenes, Asymmetric epoxidation (Sharpless and Jacobson), Sharpless asymmetric dihydroxylation reaction Organocatalysed aldol reaction (Use of proline)</p>	6 hours
	<p>5. Stereoisomerism due to axial chirality, planar chirality and helicity.</p> <p>5.1 Stereochemistry and configurational (R/S) nomenclature in appropriately substituted allenes, alkylidenecycloalkenes, spiranes, adamantoids, biaryls, trans-cycloalkenes, cyclophanes and ansa compounds.</p> <p>5.2 Atropisomerism in biphenyls and bridged biphenyls.</p>	3 hours
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-503

Title of the Course: Synthetic Methods in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. Part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various concepts related to making carbon-carbon bonds.2. To understand designing of organic synthesis to make molecules of interest.3. To plan total synthesis based on protection-deprotection strategy.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how a carbon-carbon bond can be constructed.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<p>1. Formation & reactions of enols and enolates.</p> <p>1.1. Keto-enol tautomerism: introduction, acidity, basicity concepts & pKa scale, neutral nitrogen and oxygen bases. Formation of enols by proton transfer, requirements for and mechanism of enolisation 51pprox.51d by acids & bases, types of enols & enolates, kinetically & thermodynamically stable enols, consequences of enolisation, stable enolate equivalents, preparation and reactions of enol ethers.</p> <p>1.2. Formation of Enolates: Introduction, preparation & properties, non-nucleophilic bases, E / Z geometry in enolate formation, kinetic vs. thermodynamic control, other methods for the generation of enolates, issue of enolate ambidoselectivity.</p> <p>1.3. Alkylation of enolates: diverse reactivity of carbonyl groups, alkylation involving nitriles and nitroalkanes, choice of electrophile for alkylation, lithium enolates of carbonyl compounds and alkylation, specific enol equivalents to alkylate aldehydes and ketones, alkylation of β-dicarbonyl compounds, problem of regioselectivity during ketone alkylation and the remedy provided by enones.</p> <p>1.4. Reaction of enolates with aldehydes and ketones: introduction, aldol reaction including cross & intramolecular version, enolizable substrates which are not electrophilic in nature, controlling aldol reactions with specific enol equivalents, specific enol equivalents for carboxylic acids, aldehydes and ketones.</p> <p>1.5. Acylation at carbon: Introduction, the Claisen ester condensation (intramolecular and inter / crossed),</p>	18 hours

	<p>acylation of enolates by esters, preparation of keto-esters by the Claisen reaction, directed C-acylation of enols and enolates & acylation of enamines.</p> <p>1.6. Conjugate addition of enolates: Introduction, thermodynamic control vs. conjugate addition, utility of various electrophilic alkenes in conjugate addition, formation of six-membered rings <i>via</i> conjugate addition and nitroalkanes as versatile synthons.</p> <p>1.7. Examples pertaining to the application of following condensation reactions in organic synthesis: Mukaiyama reaction, Perkin reaction, Dieckmann condensation, Knoevenagel condensation & Doebner modification, Stobbe condensation, Darzen's glycidic ester condensation, Michael addition, Robinson annulation, and the Sakurai reaction.</p>	
	<p>2. Synthetic utility of the following name reactions / methodology with specific examples:</p> <p>2.1 Mannich Reaction, Nef Reaction, Mitsunobu and Appel Reaction, Baylis Hillman reaction, Mc. Murry coupling, vicarious nucleophilic substitution, Steglich and Yamaguchi esterification, Ring closing and cross metathesis: Grubb's various generation, Grubbs-Hoveya, Schrock catalysts- Scope and challenges in terms of ring sizes as well as FG tolerance.</p>	6 hours
	<p>3. The Ylids in Organic Synthesis.</p> <p>3.1. Phosphorus Ylids: Nomenclature and Preparation. Wittig olefination: mechanism, stereoselectivity, cis- and trans-selective reactions, Wittig reagents derived from α-halo carbonyl compounds,</p> <p>3.2 Modified Wittig, Horner – Wadsworth – Emmons, Stille-Gennari modification with achiral and chiral substrates, Peterson reaction, Julia Olefination.</p> <p>3.3. Sulfur Ylids: sulfonium & sulfoxonium ylids in synthesis, diphenylcyclopropyl sulfonium ylids & their reactions with carbonyl compounds / Michael acceptors.</p>	6 hours
	<p>4. Protecting Groups in Organic Synthesis.</p> <p>4.1. Introduction, when are Protecting Groups needed? Effective use of protective groups. Umpolung of reactivity & protecting groups.</p> <p>4.2. Common protective groups namely acetals & ketals, ditho acetal/ketals, trialkylsilyl, TBDMS, THP, -OMPM, MOM, MTM, MEM, SEM & benzyl ether, methyl ether, benzyl amine, Cbz, t-Boc, Fmoc, t-butyl ester and methods for deprotection. Examples of multistep synthesis using</p>	6 hours

	protection-deprotection procedures.	
Pedagogy:	Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-504

Title of the Course: Pericyclic and Organic Photochemical Reactions.

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses/topics in Synthetic Organic Chemistry & organic spectroscopy at M Sc Part-I level.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of various concepts in pericyclic chemistry based on molecular orbital theory.2. Introduction of analysis of pericyclic reactions using theoretical concepts.3. Learning mechanistic aspects of pericyclic & photochemical reactions in organic synthesis.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict course of given pericyclic reaction using the theoretical concepts.2. Students should be in a position to apply various to understand stereochemical output in a reaction.3. Students shall be in a position to understand/propose plausible mechanism of pericyclic/photochemical reactions.	
<u>Content:</u>	<p>1. Pericyclic Reactions Theory of pericyclic reactions- a) Frontier Molecular Orbital (FMO) theory b) Transition state aromaticity (Möbius-Hückel theory) concept c) Orbital correlation diagram method Analysis of pericyclic reactions (including stereochemistry) using the above concepts a) Cycloaddition reactions b) Electrocyclic reactions c) Sigmatropic rearrangements (Note: Various important features to be discussed taking examples of well-known reactions of each type) Some synthetically useful reactions (theory and examples) a) 1, 3-dipolar additions (Application of FMO theory and examples) b) [3, 3] Shifts; Claisen and Cope rearrangements and fluxional molecules, c) ene reaction, retro-Diels-Alder reactions.</p> <p>2. Organic Photochemistry a) Principles of energy transfer, theoretical concepts in organic photochemistry w. r. t.</p>	<p>24 hours</p> <p>12 hours</p>

	<p>cycloadditions, electrocyclic reactions etc.,</p> <p>b) Some photochemical reactions of alkenes, dienes, carbonyl compounds and arenes including the following- Cis-trans isomerization and photostationary equilibrium; Paterno-Buchi reaction ; Norrish Type cleavages; Di-pi methane rearrangement; bicycle rearrangement</p> <p>c) Reactions involving singlet and triplet oxygen</p>	
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-505

Title of the Course: Organic mixture separation and identification

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M. Sc. Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic separations.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Separation of organic components based on solubility. 2. Separation of organic components based on functionality. 3. Separation of organic components based on boiling points. 4. Distillation, recrystallization and derivatisation. 5. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.	
<u>Content:</u>	Three component mixture separation based upon differences in the physical and the chemical properties of the components. Elemental and functional group analysis and determination of physical constants of the individual compounds. Derivative preparation, its recrystallization and m. p. of each component and characterization of each component and its derivative by m. p. comparison. (Minimum 12 experiments of 6h each.) Assessment to be done through a 6hr examination comprising of an experiment emphasizing separation of mixture, elemental analysis of all three components and preparation of derivative of any one component suggested by examiner and recording of the physical constants and an oral assessment.	72 hours
<u>Pedagogy:</u>	Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-501

Title of the Course: Chemistry of Natural Products

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on stereochemistry, spectroscopy and synthetic organic chemistry at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	1. To study the main classes of natural products. 2. To understand the different methods that are used in natural product chemistry, including extraction, isolation and structural elucidation. 3. To understand the key biosynthetic pathways for the biosynthesis of terpenes, alkaloids and steroids.	
<u>Course Outcome</u>	3. Students should able to identify different types of natural products, their occurrence, structure biosynthesis and properties. 4. Students should able to carry out independent investigations of plant materials and natural products.	
<u>Content:</u>	1. General methods of purification and structure elucidation of Natural Products 1.1 General methods of isolation-The modern distillation process, maceration, enfleurage, extraction by cold pressing and extraction with solvents. 1.2 Fractionation of the crude extracts and purification of the individual compounds from the respective fractions using chemical and chromatographic techniques such as Column Chromatography, TLC, Preparative TLC, HPLC, etc. 1.3 Chemical methods based on the functional groups present. Bicarbonate extraction, sodium bisulphite adduct formation, derivatization, etc. 1.4 General approach to structure elucidation of the isolated pure compounds using UV, IR, NMR spectroscopy, MS spectrometry, optical polarimetry.	5 hours
	2. Structure elucidation by classical chemical methods 2.1 Terpenoids: α -cedrene 2.2 Alkaloids: Morphine, thebaine and codeine 2.3 Steroids: Cholesterol, bile acids	6 hours
	3. Structure elucidation by combination of chemical and spectral methods 3.1 Terpenoids: α - and β -vetivones, Ishwarone 3.2 Hormones: Cecropia Juvenile hormone, brevicomin and frontalinal 3.3 Oxygen heterocycles: Aflatoxin-B1, rotenone	8 hours

	4. Structure elucidation involving stereochemistry, spectral and Chemical methods 4.1 Terpenoids: Menthol and hardwickiic acid 4.2 Alkaloids: Reserpene	4 hours
	5. Synthesis of selected Natural Products, planning and execution 5.1 Terpenoids: Longifolene (E J Corey), Caryophyllene (E J Corey) Nootkatone (A Yoshikoshi), Menthol (Tagasago) 5.2 Alkaloids: Reserpine (R B Woodward), Morphine (Marshall Gates) 5.3 Hormones: Cecropia JH (Edward), Progesterone 5.4 Prostaglandins: Prostaglandin E ₂ (E J Corey) 5.5 Antibiotics: Cephalosporin (R B Woodward)	8 hours
	6. Biogenesis and biosynthesis of Natural Products 6.1 Terpenoids and Steroids: General approach towards biosynthesis of mono-, sesqui-, di-, tri-, tetraterpenoids and steroids through mevalonate pathway with special reference to the biosynthesis of terpenoids and steroids included in topics 3 to 6 6.2 Alkaloids: The shikimate pathway formation of hydroxybenzoic acid derivatives, aromatic amino acids, L-phenylalanine, L-tyrosine, phenolic oxidative coupling, biosynthesis of thebaine, codeine and morphine.	5 hours
<u>Pedagogy:</u>	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-503

Title of the Course: Introduction to Medicinal Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry and spectroscopy at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	4. Study of drugs and drug development. 5. Introduction to the concepts and processes of drug discovery, delivery, absorption and metabolism. 6. It also provides brief introduction to pharmacology, pharmacokinetics and pharmacodynamics.	
<u>Course Outcome</u>	1. Understand the historical and advanced concepts of medicinal chemistry and its advantages 2. Identify the medicinal properties of different organic molecules.	
<u>Content:</u>	1. Introduction to Drugs 1.1. Requirement of an ideal drug 1.2. Sources of drugs 1.3. Important terms used in chemistry of drugs 1.4. Classification and nomenclature of drugs	5 hours
	2. Drug Design 2.1. Analogues and pro-drugs 2.2. Concept of lead compounds 2.3. Features governing drug design – The method of variation, drug design through disjunction, conjunction, tailoring of drugs 2.4. Cimetidine – a rational approach to drug design.	5 hours
	3. Drug Development and drug action 3.1. Screening of natural products, isolation and purification, structure determination 3.2. Structure-activity relationship, QSAR, Synthetic analogues 3.3. Natural Products as leads for new pharmaceuticals 3.4. Receptor theories 3.5. Oxaminiquine – a case study. 3.6 Mechanism of drug action. 3.6. Introduction 3.7. Enzyme stimulation 3.8. Enzyme inhibition 3.9. Sulfonamides	8 hours
	4. Study of the following class of major drugs: 4.1. Pharmacodynamic Agents. a) Local anaesthetics b) Analgesics: Narcotic and non-steroidal anti-inflammatory,	8 hours

	<p>narcotic antagonists (Mechanism of Action and Synthesis of Ibuprofen)</p> <p>c) Antiepileptic drugs</p> <p>d) Antiparkinsonism drugs</p> <p>e) Antihistaminics (SAR and synthesis of chlorpheniramine) f) Sedatives and hypnotics (Mechanism of Action of and synthesis of Phenobarbital)</p> <p>g) Antipsychotics</p> <p>h) Cardiovascular agents: Cardiovascular diseases, Antianginal agents and vasodilators, Antihypertensive agents, Antiarrhythmic drugs, Adrenergic blocking agents (Mechanism of Action of Methyl Dopa and synthesis of Propranolol)</p> <p>i) Antihyperlipidemic and antiatherosclerotic agents</p> <p>j) Anticoagulants, blood coagulation and anticoagulant mechanism</p> <p>k) Diuretics</p> <p>l) Drugs and diabetes: Synthetic hypoglycemic agents.</p> <p>5.1 Chemotherapeutic Agents.</p> <p>a) Sulfonamides (Mechanism of Action of sulphonamides) b) Antitubercular and Antilepral agents (Mechanism of Action of p-Aminosalicylic acid and Dapsone) SAR of Dapsone</p> <p>c) Antiamoebics (Mechanism of Action of Metronidazole) d) Anthelmintics</p> <p>e) Antimalarials</p> <p>f) Antiviral agents</p> <p>g) Antineoplastic Agents</p> <p>Synthesis of Dapsone sulphacetamide Isoniazid Metronidazole</p> <p>5.2. Antibiotics : General information, mode of action and application of:</p> <p>a) β-Lactam antibiotics: Penicillins and Cephalosporins</p> <p>b) Aminoglycosides: Streptomycin, Neomycin</p> <p>c) Tetracyclines</p> <p>d) Macrolides: Erythromycin, Rifamycin</p> <p>e) Lincomycin</p> <p>f) Polypeptides: Bacitracin</p> <p>g) Unclassified antibiotic: Chloramphenicol (SAR and Synthesis)</p>	<p>4 hours</p> <p>6 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-504

Title of the Course: Retrosynthesis in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels and part II organic level CHOC-501, 502, 503 and 504 courses.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various logical steps related to planning of organic synthesis.2. To apprehend the complexity of synthesis of complex organic molecules.3. To apply the knowledge gained in organic synthesis for making new molecules.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how retrosynthesis can be used in finding out easily available chemical precursors for making organic molecules.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<ol style="list-style-type: none">1. Introduction to disconnection2. Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-505

Title of the Course: Heterocyclic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels, part II organic level CHOC-501, 502, 503 and 504 courses and must be simultaneously studying CHOO-503 and 504, courses.	
<u>Course Objective:</u>	1. Understand the fundamentals of heterocyclic chemistry 2. Knowledge of synthesis of heterocycles.	
<u>Course Outcome</u>	1. Understand the reactivity of heterocycles towards electrophilic, nucleophilic, reducing and oxidizing reagents. 2. Knowledge of synthesis of heterocycles.	
<u>Content:</u>	1. Introduction, classification and Nomenclature of mono- and bicyclic heteroaromatic molecules	04 hours
	2. Physical properties, dipole moment, acidity-basicity, Aromaticity electron density distribution and reactivity of- 2.1 Furan, Thiophene, Pyrrole, Indole 2.2 Pyridine, Pyridine-N-oxide 2.3 Quinoline and isoquinoline 2.4 Diazines and triazines 2.5. 1,3- and 1,2- azoles	20 hours
	3. Synthetic strategies based on retrosynthetic approach: General methods of synthesis of the following- 3.1 Furan, Thiophene, Pyrrole, Indole 3.2 Pyridine, Quinoline and isoquinoline 3.3 Chromones	12 hours
<u>Pedagogy:</u>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-506

Title of the Course: Introduction to Polymer Chemistry-I: Basic Concepts

Number of Credits: 03

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses in Organic Chemistry at T. Y. B Sc. and M. Sc. Part-I levels.	
<u>Course Objective:</u>	Introduction to various concepts in organic polymer chemistry.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the differences in structures and properties of small molecules and macromolecules.2. The students will be in a position to understand concepts involved in polymer synthesis and characterization.	
<u>Content:</u>	1. Brief history of natural and synthetic polymers: Classification & nomenclature of polymers, Functionality concept- linear, branched and cross-linked polymers. Introduction to biodegradable polymers.	07 hours
	2. Methods and Chemistry of polymerization: Bulk, solution, suspension, emulsion, addition, condensation polymerizations. Free-radical, Ionic and co-ordination polymerization reactions and copolymerization. Introduction to controlled free radical polymerization. Carothers equation in condensation polymerizations.	12 hours
	3. Some properties of polymers: Number and weight average molecular weights, Molecular weight distribution, polydispersity, Glassy state and glass transition temperature, crystallinity in polymers. Introduction to characterization of polymers.	10 hours
	4. Additives in polymers: Lubricants, plasticizers, stabilizers, antioxidant, fire retardants, blowing agents, fillers, colorants, crosslinking agents, UV-Vis degradants etc., (properties and examples)	07 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-507

Title of the Course: Introduction to Polymer Chemistry-II: Synthesis of Polymers and Processing

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the course entitled- Introduction to polymer Chemistry-I: Basic Concepts	
<u>Course Objective:</u>	Introduction to various concepts involved in the synthesis and processing of organic monomers and polymers.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the synthetic methodology and applications of various monomers and polymers.2. The students will be in a position to understand concepts involved in polymer processing.	
<u>Content:</u>	<ol style="list-style-type: none">1. Resources for monomers, manufacture of some important monomers and reagents: Ethylene, propylene, butadiene, isoprene, styrene, divinyl benzene, acrylates, acrylonitrile, vinyl chloride, formaldehyde, adipic acid, urea, bisphenol-A, melamine, terephthalic acid, phthalic anhydride, dimethyl terephthalate, glycol, glycerol, ethylene oxide, epichlorohydrin, ϵ-caprolactum, di-isocyanates, pentaerythritol, allylic carbonate monomers.	14 hours
	<ol style="list-style-type: none">2. Synthesis, properties and applications of certain polymers: Vinyl polymers- LDPE, HDPE, PVC, PVA, polyvinyl acetate, polyacrylates, methacrylates, polystyrene, teflon, ABS, SBR, SAN. Condensation polymers- Nylons, polyesters, polyurethanes, polycarbonates. Thermoset polycarbonates like CR-39 Cellulose esters- cellulose acetate, nitrates and acetate-butyrates. Natural rubber, Thermoset resins- phenol-formaldehyde, resols and novolacs, melamineformaldehyde, urea-formaldehyde, epoxy resins - their curing.	14 hours
	<ol style="list-style-type: none">3. Polymer processing – Introduction to compounding, and processing techniques like calendaring, casting, moulding and spinning in polymer processing.	08 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry)

Course Code: OCO-508

Title of the Course: Selected Experiments in Organic Chemistry-I

Number of Credits: 4

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M Sc Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Stoichiometric requirements during organic syntheses. 2. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents. 3. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of microwave, photochemistry, low temperature synthesis etc. 4. Use of organic spectroscopic techniques in monitoring the organic syntheses.	
<u>Content:</u>	(Group A: minimum 8 experiments) 1. Dimedone from mesityl oxide (Dieckmann condensation). 2. 1,2,3,4-tetrahydrocarbazole from cyclohexanone (Fisher indolisation reaction). 3. o-Chlorobenzylidene rhodanine (Perkin reaction). 4. Diels- Alder reaction of anthracene and maleic anhydride using microwave irradiation. 5. Oxidation of a primary / secondary alcohol to carbonyl compound by polymer supported chromic acid (Amberlyst A - 26, chromate form). 6. Phenytoin from benzil and urea. 7. Use of protecting groups: Synthesis of 1,1-diphenylbut-1-en-3-one 1) Ethyl acetoacetate ethylene acetal. 2) 1,1-Diphenyl -1-hydroxy-3- butanone ethylene acetal. 3) 1,1-Diphenyl -1-hydroxy- 3-butanone. 4) 1,1-Diphenylbut-1-en- 3 -one. 8. Isoborneol from camphor (NaBH ₄ reduction) 9. 3 -Methyl -2-phenyl-2-butanol from 2-bromopropane and acetophenone 10. Friedel- Crafts acylation of anisole.	48 hours

	<p>11. Diethyl 4- butyl malonate by malonic ester condensation</p> <p>(GROUP B: minimum 8 experiments)</p> <ol style="list-style-type: none"> 1. Epoxidation of cholesterol or related compounds 2. 2,2 - dichloro bicyclo (4.1.0) heptane from cyclohexene and dichloro cabene using PTC. 3. Reduction of Nitrobenzene to aniline by Sn / HCl. 4. 2 - methyl benzimidazole from o-phenylene diamine. 5. Benzophenone oxime to benzanilide (Beckmann rearrangement). 6. Ferric chloride oxidative coupling of 2-naphthol: 2,2'- dihydroxy dinaphthyl 7. Dicoumarol from coumarin derivative. 8. LAH reduction of Anthranilic acid. 9. Norborneol to norcamphor using chromiurn trioxide/sulfuric acid 10. Halogenation using NBS: preparation of 9-bromoanthracene (or benzylic bromides) 11. Benzhydrol from benzaldehyde (Grignard reaction) 12. Ethyl n-butyl acetoacetate by acetoacetic ester condensation <p>Note: Students are expected to use techniques like TLC, IR, GC for monitoring/ establishing purity, identity of the synthesized compounds.</p>	48 hours
<u>Pedagogy:</u>	<p>Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.</p> <p>The students are required to undertake pre-lab. and post – lab. assignment as instructed by the concerned teacher and the same may be evaluated by according suitable weightage as an ISA component while prescribing the mode of assessment.</p>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-509

Title of the Course: Chemistry of Life

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the basic of amino acid, fatty acid and types of carbohydrates at BSc (Chemistry)	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of types of amino acid and proteins2. Introduction of carbohydrates and lipids3. Understanding characteristics of proteins, carbohydrates & lipids and their applicability in daily life4. Understanding chemicals used in food production through food processing, storage and cooking.5. Understanding food analysis and the chemistry of the digestion of food and the energy provided by food.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict type of proteins, lipids and carbohydrates available in food.2. Students should be in a position to apply knowledge role of cooking in daily food.3. Students shall be in a position explore the chemical structure and functionality for the macronutrient categories like carbohydrates, lipids, and protein in food4. Student will be able to design experiments through an inquiry-oriented, food chemistry focused laboratory program.5. The students should be able to identify the essential chemical components of food and have knowledge of their analyses, gained a working knowledge of the chemistry of lipids, carbohydrates and proteins	
<u>Content:</u>	<p>1. Chemistry and Functionality of Proteins Major food proteins Structure, physical function in food Analysis: Proteins</p> <ol style="list-style-type: none">a) Introduction of amino acid and role of polar, non-polar, acidic and basic side chains and also their properties, and Isoelectric pointb) Introduction of peptide, dipeptides and proteins.c) Types of proteins (primary (1°), secondary (2°), tertiary, (3°) and Quaternary (4°)<ul style="list-style-type: none">• Hydrogen bonding between side chains• Salt Bridges between side chains• Hydrophobic - non-polar interactions• Disulfide linkaged) Protein folding, denaturation, functional properties of proteins.e) Food Proteins – Source of Nutrients and Analysis of proteins and amino acidsf) Other Methods used in the Study of Food Proteins <p>2. Chemistry and Functionality of Major Components of Food: Carbohydrates</p> <p>Introduction of Mono, di and oligosaccharides, starch, Dietary fibre and gums, their reactions and physical function in food and their analysis.</p>	<p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> a) Content in common foods b) Discuss Fischer projections, Haworth Projections, stereoisomerism c) Major reactions d) Sugars: Hydrolysis, thermal degradation, Maillard reaction (non-enzymic browning reaction between reducing carbohydrates and proteins) e) Starch retrogradation (staling of bread) f) Mutarotation g) Decomposition of sugars: Maillard Reaction (Maillard Browning), Amadori Rearrangement and Analysis of Sugars h) Discuss Fischer projections, Haworth Projections, stereoisomerism <p>3. Chemistry of Major Components of Food: Lipids</p> <ul style="list-style-type: none"> a) <i>Fats: Fats in nutrition to be discussed</i> b) <i>Classes of lipids, fatty acids,</i> c) <i>monoglycerides,</i> d) <i>diglycerides,</i> e) <i>triglycerides, polar</i> f) <i>lipids</i> g) <i>Reaction of fats- Oxidative and hydrolytic rancidity</i> h) <i>Analysis</i> i) <i>Fats in food- for e.g. Chocolate</i> j) Other Methods Used in the study of food lipids to be discussed 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Thermodynamics and Reaction Kinetics

Course Code: PCC-502

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce to classical & non-equilibrium thermodynamics. To introduce advances in reaction kinetics.	
Course Outcomes:	Students should be in a position to understand various concepts of thermodynamics and kinetics. Students should be in a position to apply the knowledge of thermodynamics and kinetics for their lab course in physical chemistry, dissertation and research work.	
Content:	2. Equilibrium Thermodynamics 1.1 Thermodynamic state functions. Exact and inexact differentials; partial derivatives. Maxwell relations. 1.2 Thermodynamic equations of state. Temperature and pressure dependence of Gibbs function. Gibbs-Helmholtz equation. Partial molar quantities. Free energy change accompanying a chemical reaction, chemical potential, Gibbs-Duhem equation. Duhem-Margules equation. 1.3 Entropy of mixing for gases and liquids. Gibbs paradox. 1.4 Thermodynamic derivation of phase rule.	9 hours
	2. Non-equilibrium Thermodynamics 2.1 Concept of internal entropy and spontaneity of a process in relation to free energy. Chemical affinity and extent of a reaction. Mass and energy balance equations. Entropy production in heat flow, chemical reactions and open system. 2.2 Postulates and methodologies, linear laws, Gibbs equations, Onsager's reciprocal theory. Validity of Onsager's equation and its verification. Application to thermo-electric and electro-kinetic phenomena.	9 hours
	3. Reaction Kinetics 3.1 Collision theory of reaction rates and treatment of unimolecular reactions. Theory of absolute reaction rates and its applications to reactions in solution. Thermodynamic study from reaction kinetics, comparison of results with Eyring and Arrhenius Equations. Solvent and salt effects; influence of ionic strength and solvent on the rates of reaction, primary and secondary salt effects. 3.2 Mechanism of photochemical, chain, coupled and Reversible reactions. Oscillatory reactions. Chemical Hysteresis in Belousov-Zhabotinskii reaction. 3.3 Fast reactions and study by stopped flow technique, relaxation method, pulse radiolysis, flash photolysis and magnetic resonance methods. 3.4 Homogeneous catalysis and Michaelis-Menten kinetics. Kinetic	18 hours

	<p>rate law for autocatalytic reactions. Kinetics of heterogeneous reactions, heterogeneous catalysis, inhibition, product induced and non-reactive inhibition.</p> <p>3.5 Potential energy surfaces and introduction to molecular reaction dynamics, theoretical calculation of energy of activation, chemical lasers.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<ol style="list-style-type: none"> 1. P.W. Atkins & J. De. Paulo, <i>Atkins' Physical Chemistry</i>, Oxford Univ. Press, 2007, 8th Ed. 2. J. Rajaram, J.C. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Electrochemistry and Surface Studies

Course Code: PCC-503

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce electrochemical processes such as ion-ion and ion solvent interactions. To introduce thermodynamics of electrochemical processes, kinetics of electrochemical reactions, electrochemistry of fuel cells, batteries and super capacitors.	
Course Outcomes:	Students should be in a position to understand various concepts of electrochemistry. Students should be in a position to apply the knowledge of electrochemistry for their dissertation and research work. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	3. Electrolyte Solutions 1.1 Ion-solvent interactions. Born Theory, validity and limitations. 1.2 Difference between solvation number and coordination number. 1.3 Ion-ion interactions and Debye-Huckel theory of ion cloud. 1.4 Concept of ionic strength and activity coefficient. 1.5 Debye-Huckel limiting law and its modifications. 1.6 Transport of ions in solution. Relaxation and Electrophoretic effects. 1.7 Debye-Huckel-Onsager equation, validity and limitations.	8 hours
	2. Electrified Interfaces 2.1 Formation of an electrified interface and its structure. 2.2 Polarizable and non-polarizable interfaces. 2.3 Concepts of outer potential, surface potential, inner potential and relationship between them, chemical and electrochemical potentials. 2.4 Concept of surface excess, Electro-capillary curves, Condition for thermodynamic equilibrium at electrified interface. 2.5 Generalized Gibbs equation, Lippmann equation and capacity of the double layer. 2.6 Models of the electrified interface. 2.7 Surface phase and Gibbs adsorption equation. Surface tension and adsorption on solid. Determination of surface excess.	8 hours
	3. Electrode Kinetics and Corrosion 3.1 Disturbance of electrode equilibrium, cause of electron transfer, fast and slow systems and their current-potential relationship. 3.2 Butler-Volmer equation and its low and high field approximations. 3.3 Nernst equation as a special case of B-V equation. 3.4 Tafel plots for anodic and cathodic processes. 3.5 Study of pH-potential diagrams.	8 hours

	<p>3.6 Pourbaix diagram for corrosion of iron.</p> <p>4. Colloids and Mircoemulsions.</p> <p>4.1 Charge and Stability of Sols. DLVO theory</p> <p>4.2 Electrokinetic phenomena: Electroosmosis, streaming potential and current, electrophoresis. Zeta potential.</p> <p>4.3 Donnan membrane equilibria.</p> <p>4.4 Micelles and reverse micelles: solubilisation, and bilayers.</p> <p>4.5 Microemulsions</p> <p>5. Electrochemical Energies</p> <p>5.1 Thermodynamics of electrochemical energy conversion.</p> <p>5.2 Batteries: basic principles; rating and shelf life. Zinc-manganese dioxide: Leclanche and alkaline batteries. Lithium ion batteries and recharge ability.</p> <p>5.3 Fuel cells: Principle of a hydrogen-oxygen fuel cell. Classification of fuel cell systems based on types of electrolytes/temperature. Direct methanol-polymer electrolyte fuel cell and electro-catalysts - a case study. Reactions occurring in various fuel cells and calculation of their electrode and cell potentials</p> <p>5.4 Super capacitors: Introduction: Origin of supercapacitance. Aqueous systems – ruthenium oxide/carbon with sulphuric acid and or solid polymer electrolytes.</p>	<p>6 hours</p> <p>6 hours</p>
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Group Theory and Spectroscopy

Course Code: PCC-504

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce concepts in Group Theory and its applications to chemistry. To introduce some advanced topics in spectroscopy.	
Course Outcomes:	Students should be in a position to understand various concepts of Group Theory. Should be able to apply character table to solve various problems. Students should be in a position to apply the knowledge of spectroscopy for their dissertation and research work.	
Content:	<p>4. Elements of Group Theory</p> <p>1.1 Symmetry elements and symmetry operations, Concept of group and group multiplication tables, order of the group, classes and subgroups in a group, Different types of groups (cyclic, abelian and non-abelian groups).</p> <p>1.2 Point groups, Matrix representations of a group, Reducible and Irreducible representations groups, Great Orthogonality Theorem, Properties of Irreducible representations, Mulliken symbols for Irreducible representations, Character tables.</p> <p>1.3 Standard reduction formula, Direct products of representations and its applications Quantum Chemistry and spectroscopy: Vanishing of integrals, Selection rules. Applications of group theory for hybridization of atomic orbitals. Projection operator and Symmetry adapted linear combinations (SALCs), MO treatment (within Huckel Molecular Orbital Theory) of large molecules with symmetry. Applications of group theory to Infra-red and Raman spectroscopy.</p> <p>2. Microwave, IR and Raman Spectroscopy</p> <p>2.1 Theoretical treatment of Rotational and Vibrational spectroscopy.</p> <p>2.2 Principle of Fourier Transform (FT) spectroscopy, FTIR spectroscopy Theory, instrumentation and applications.</p> <p>2.3 Quantum theory of Raman effect, Raman shift, Instrumentation, Resonance Raman spectroscopy, Complementary nature of IR and Raman spectroscopy in structure determination, Applications.</p> <p>3. NMR Spectroscopy</p> <p>3.1 Basic principles of NMR.</p> <p>3.2 Theory of pulse NMR and Fourier analysis, FT-NMR.</p> <p>3.3 Solid state NMR, magic angle spinning (MAS), dipolar decoupling and cross polarization, applications of solid state NMR.</p> <p>3.4 Double resonance, NOE, Spin tickling, Solvent and shift reagents, Structure determination by NMR.</p> <p>4. ESR Spectroscopy</p>	<p>18 hours</p> <p>6 hours</p> <p>8 hours</p> <p>4 hours</p>

	<p>4.1 Theory and experimental techniques, Identification of odd-electron species (methyl and ethyl free radicals) and radicals containing hetero atoms.</p> <p>4.2 Spin trapping and isotopic substitution, Spin densities and McConnell relationship, Double resonance techniques.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

	<ol style="list-style-type: none"> 1. To determine the partial molal volume of ethanol-water mixture at a given temperature 2. To study the phase rule for two component system 3. To determine the partial molal volume of sodium chloride-water, ethanol-water and methanol-water system (apparent molal volume method) 4. To determine the effect of salt on surface tension of water using by capillary rise method 5. To study effect of surfactants on surface tension of water using stalagmometer 6. To study the variation of viscosity with composition of mixtures and to verify the formation of compounds by Oswald's viscometer 7. To study the effect of pH on the kinetics of iodination of aniline 8. To study the kinetics of reaction between H_2O_2 and KI (clock reaction) 9. To study the kinetics of rapid reaction between bromine and iodine in aqueous media 10. To investigate the autocatalytic reaction between potassium permanganate and oxalic acid. 11. To study the electroless deposition of Ni on non-conductor substrate and to determine the rate of deposition 12. To study the acid and alkaline corrosion susceptibility of metal and to determine the rate of corrosion 13. To study the catalytic activity of three different metal oxides in heterogeneous systems with H_2O_2 decomposition reaction 14. To determine the molecular weight of a polymer by intrinsic viscosity method. <p>Group - C. Computers in Chemistry</p> <ol style="list-style-type: none"> 1. To generate a mark sheet to learn various features of spreadsheets (revision) 2. To generate a plot for a given function (like solutions of 1D box, harmonic oscillator, H-like atom wave functions, Gaussians distributions etc) (revisions) 3. To write a computer program to obtain equivalence point in pH-metry and potentiometric experiments (derivative method) 4. To write a computer program to find percent composition for various atoms of a given molecular formula 5. To write a computer program to obtain slope and intercept for linear data using least square fit method 6. To write a computer program to obtain center of mass of a given molecule and moment of inertia, hence obtain 	24 hr
--	--	-------

	<p>classification of the given molecule</p> <p>7. To write a computer program to find out various parameters for data analysis viz. minimum, maximum, average, standard deviation, variance, covariance, correlation coefficient, frequency distribution etc.</p> <p>8. To write a computer program to obtain thermodynamic probability.</p> <p>9. To write a computer program to obtain degeneracy of a given energy level for a particle in a cube.</p> <p>Note: A minimum of 4 experiments from each group A-C are to be carried out.</p>	
Pedagogy:	Practical / Hands on sessions will be conducted.

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course PCC 401, PCO 401 in M.Sc. I. so as to have basic knowledge of material chemistry and reaction kinetics.	
Course Objectives:	1. To introduce concepts of solid state science 2. To provide fundamental knowledge of solids, description of crystal chemistry and classification of crystal structure and significance of crystal defects. 3. To provide basic understanding of temperature dependence of crystal structure, phase modifications and its influence on magnetic and electric properties of solids	
Course Outcomes:	1. Students should be in a position to understand the concept of solid state synthesis. 2. Students should be able to identify different solids based on crystal structure 3. Students should be in a position to understand the significance of crystal structure and its modifications, so as to enhance the magnetic and electrical properties to suit energy applications.	
Content:	<p>1. Solid State: Introduction</p> 1.1 General Principles and experimental procedure. 1.2 Hydrothermal and thin film method in solid state synthesis 1.3 Kinetics of solid state reactions, ion exchange and intercalation reactions.	5 hours
	<p>2. Crystal Chemistry:</p> 2.1 Unit Cells, close packed structures-ccp and hcp. 2.2 Ionic structures and covalent networks. 2.3 Some important structure types – rock salt, zinc blende, wurtzite, nickel arsenide and rutile. 2.4 Factors that Influence Crystal Structures: valencies and coordination numbers. 2.5 Significance of radius ratio rule and non-bonding electron effects.	10 hours
	<p>3. Crystal Defects and non stoichiometry:</p> 3.1 Types of defects. Point defects and thermodynamics. 3.2 Colour Centres, vacancies and interstitials in non stoichiometric crystals. 3.3 Dislocations, mechanical properties and reactivity of solids.	5 hours
	<p>4. Symmetry, Point Groups and Space Groups:</p> 4.1 Symmetry, miller Indices, lattice planes, d-spacings and multiplicities 4.2 Representation of point groups and space groups	4 hours
	<p>5. Phase Diagrams and Phase Transitions</p> 5.1 Basic Concepts and definitions. 5.2 Three component condensed systems. Martensitic	4 hours

	transformations. Order-disorder transitions.	
	6. Ionic Conductivity and Solid Electrolytes: 6.1 General Introduction 6.2 Conduction in NaCl and AgCl 6.3 DC and AC resistivity measurements	4 hours
	7. Electronic Properties and Band Theory 7.1 Electronic structure and band theory of solids. 7.2 Band structure of metals and semiconductors. 7.3 Magnetic properties of transition metal oxides and applications	4 hours
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.	
Text Books / Reference Books	1. A. R. West, <i>Solid State Chemistry and Its Applications</i> , John Wiley & Sons 2003. 2. H. V. Keer, <i>Principles of the Solid State</i> , New Age International Publishers, 1993.	

Effective from AY: 2019-20

94

	<p>Precipitation method, Impregnation method catalyst impregnation with or without interaction between support and catalyst. Synthesis of microporous solids. Synthesis of mesoporous solids.</p> <p>4. Thermal and Spectroscopic Methods in Heterogeneous Catalysis</p> <p>4.1 Characterization of the catalysts by temperature programmed desorption using probes such as ammonia and pyridine molecules. Characterization of adsorbed molecules /intermediates by IR spectroscopy and XPS.</p> <p>5. Selected Catalytic Applications</p> <p>5.1 Introduction to zeolites, structure building in zeolites with suitable example. Zeolite catalysis in MTG process. Introduction to semi-conductor surface and electrocatalysis with application in photocatalytic and electrocatalytic water splitting and treatment of waste water contaminated with dyes</p>	<p>4 hours</p> <p>10 hours</p>
Pedagogy:	Mainly lectures, tutorials, assignments, self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Chemistry)

Course Code: PCO-503

Title of the Course: Solid State Chemistry II: Characterization of solid materials

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course Solid State Chemistry I : Concepts and Application, so as to have basic knowledge of solids state chemistry.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none">1. To introduce solid state characterization methods and techniques.2. To provide fundamental knowledge of principles and instrumentation involved in selected techniques.3. To provide comparative evaluation of data obtained from various techniques and its use in elucidating the chemical and morphological structure of solid materials	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand the design of the instrumental techniques, data acquisition and storage.2. Students should be able to understand the fundamental principles governing the technique, data interpretation and analysis to elucidate structural information of solid materials3. Students should be in a position to understand and apply the concept learned to make the best choice of a characterization technique(s) for elucidation of unknown solids under investigation.	
Content:	<p>1. Thermal Analysis 1.1 Thermogravimetric analysis, Differential Thermal Analysis 1.2 Differential scanning calorimetry 1.3 Application to characterization of materials</p> <p>2. X – Ray Diffraction: 2.1 The powder X-ray diffraction experiment, instrumentation 2.2 Intensities: scattering of X-Rays and factors that affect intensities, powder x-ray pattern 2.3 Introduction to single crystal x-ray diffraction. 2.3 Applications of high temperature powder diffraction. 2.4 Identification of crystal phases and evaluation of lattice characteristics</p> <p>3. Microscopic Techniques 3.1 Introduction to Electron Microscopy: Generation of electron beam, elastic and inelastic scattering of electrons by atoms 3.2 Scanning Electron Microscopy (SEM): Instrumentation, optics, resolution and compositional imaging, acquisition and data storage. Preparation of specimen, crystallographic information from SEM and environmental scanning electron microscopy</p>	<p>5 hours</p> <p>10 hours</p> <p>6 hours</p>

	<p>3.3 High Resolution Transmission Electron Microscopy (HR-TEM): Instrumentation, contrast mechanism, high voltage and scanning transmission microscopy, preparation of specimen and data interpretation.</p> <p>4. Selected Spectroscopic Techniques</p> <p>4.1 Vibrational spectroscopy: IR and Raman spectroscopy, fundamental principle, instrumentation and design, applications to ferroelectric materials such as LiNbO_3 and LiTaO_3.</p> <p>4.2 Visible and UV spectroscopy of solids: Fundamental principle, diffuse reflectance measurement, instrumentation and design, structural studies of transition metal oxides, glass and laser materials.</p> <p>4.3 X ray Spectroscopy: XRF, XANES and EXAFS: Absorption coefficient, absorption edges, resonance emission, extended absorption and photoelectron scattering. Instrumentation and design, characterization of transition metal oxides.</p> <p>4.4 Mössbauer Spectroscopy: Mössbauer effect, recoil free absorption and emission in solids, isomer shift, quadrupole splitting, magnetic splitting, instrumentation and design, characterization of Iron compounds.</p>	15 hours
Pedagogy:	Mainly lectures, tutorials, assignments and presentations or a combination of some of these could also be used to some extent.

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course PCC- 401, PCO- 401 in Semester I/II, so as to have basic knowledge of reaction kinetics.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce concepts of reaction kinetics and dynamics 2. To provide fundamental knowledge of theories that govern chemical reactions 3. To introduce newer classes of reaction types and their kinetics 4. To introduce latest developments in the advance instrumental techniques and methods for monitoring reaction kinetics and dynamics. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand the concept of reaction kinetics and its significance. 2. Student will be able to differentiate between different reaction types, their kinetic analysis and its significance 3. Students should be able to apply these kinetic concepts to perform laboratory experiments in reaction kinetics. 3. Students should be in a position to apply these concepts of real life applications such as combustion engines, photochemical systems and atmospheric chemistry research. 	
Content:	<ol style="list-style-type: none"> 1.0 Theories of reaction rates 1.1 Generalized kinetic theory and extended collision theory. Concept of collisional number, collisional frequency factor, collisional and reactive cross section, steric factor, microscopic rate constant. Assumptions and limitations of collision theory 1.2 Conventional transition state theory, equilibrium hypothesis and derivation of reaction rates. Thermodynamic formulation of transition state theory. Arrhenius temperature dependent and independent activation energy and its significance. Assumptions and limitations of transition state theory. Introduction to extended transition state theory and microscopic reversibility. 1.3 Lindemann-Hinshelwood theory of thermal unimolecular reactions. Statistical energy dependent rate constant. Introduction to RRK and RRKM Theory and its applications. 	8 hr
	<ol style="list-style-type: none"> 2.0 Elementary reactions in solutions 2.1 Collisional kinetics in solution, effect of solvent polarity solvent cohesion energy, influence of ionic strength and ion-dipole and dipole-dipole reactions on reaction rates. Comparison of gas phase and solution reactions. 	3 hr
	<ol style="list-style-type: none"> 3.0 Homogeneous and surface reactions 	8 hr

	<p>3.1 Homogeneous kinetics, enzymatic reactions and Michaelis-Menten, Lineweaver-Burk and Eadie Analysis</p> <p>3.2 Autocatalytic and inhibition reactions. Product induced competitive and non-competitive inhibition reactions.</p> <p>3.3 Adsorptions: competitive, non-ideal and dissociative adsorptions</p> <p>3.4 Mechanism of surface reactions, kinetic effects of surface heterogeneity and interactions.</p> <p>3.5 Eley-Rideal, Langmuir Hinshelwood and Mars van Krevelen kinetic models of surface reactions</p> <p>4.0 Composite reactions</p> <p>4.1 Types of composite mechanisms, rate equation for composite mechanisms, simultaneous and consecutive reactions</p> <p>4.2 Decomposition reactions of ozone and acetaldehyde</p> <p>4.3 Gas phase combustion reactions, hydrogen – oxygen combustion, introduction to shock tube method and its use in combustion analysis.</p> <p>4.4 Polymerization kinetics, stepwise and chain polymerization.</p> <p>5.0 Fast Reactions</p> <p>5.1 Photochemical fast reactions: primary photochemical processes, reactions of electronically excited species and photochemical equivalence.</p> <p>5.2 Pulsed laser photolysis, multiphoton excitation processes and its use in monitoring fast reactions.</p> <p>5.3 Radiation-chemical reactions: radiation chemical primary processes, kinetic measurements in radiolysis method.</p> <p>5.4 Comparison of relaxation method and stopped flow technique.</p> <p>6.0 Reversible, Irreversible and Oscillatory reactions.</p> <p>6.1 Kinetics of reversible, irreversible reactions and graphical analysis</p> <p>6.2 Voltera-Lotka hypothesis of oscillatory reactions. The significance of bi-stability in the Briggs-Rauscher Reaction and Belousov-Zhabotinskii reaction.</p> <p>7 Reaction Dynamics</p> <p>7.1 Reactive collisions, chemiluminescence and laser induced fluorescence.</p> <p>7.2 Introduction to potential energy surfaces, internal coordinates and modes of vibration with suitable examples.</p> <p>7.3 Introduction to molecular reaction dynamics, investigation of reaction dynamics with ultrafast lasers.</p>	<p>4 hr</p> <p>5 hr</p> <p>4 hr</p> <p>4 hr</p>
--	---	---

Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Chemistry)
Title of the Course: Colloids and Surface Science
Course Code: PCO-505
Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/ hours
Course Objectives:	To Introduce surface properties of materials and forces at different interfaces. To introduce the concept of micelles, microemulsions. To introduce different adsorption models.	
Course Outcomes:	Students should be in a position to understand surface phenomenon and properties of interfaces. Students should be in a position to understand electrochemical phenomenon at interfaces. Students should be in a position to apply these concepts during the lab course in physical chemistry	
Content:	<p>1. Liquid Surfaces and Interfaces</p> <p>1.1 General Introduction. Microscopic picture of liquid surface. 1.2 Surface tension and its measurement. Curved liquid surfaces. 1.3 The Kelvin equation and capillary condensation. 1.4 Nucleation Theory. 1.5 The surface excess. Gibbs energy and surface tension. The surface tension of pure liquids. Gibbs adsorption isotherm.</p> <p>2. Electrokinetic Phenomena and Surface Forces</p> <p>2.1 Electrocapillarity – theory and measurement. 2.2 Charged surfaces such as mercury, silver iodide and oxides. Measurement of surface charge densities. 2.3 Electrokinetic phenomena: concept of zeta potential. 2.4 Surface forces – Van der Waals forces between molecules. Surface energy and Hamaker constant. 2.5 Measurement of surface forces. The DLVO theory and beyond. 2.6 Contact angle and its measurements. The line tension. Wetting and wetting transitions.</p> <p>3. Solid Surfaces</p> <p>3.1 Surface stress and surface tension. Determination of surface energy. Surface steps and defects 3.2 Solid – solid interfaces 3.3 Microscopy of Solid surfaces: Optical microscopy, Electron Microscopies, Scanning Probe Microscopy (STM, AFM). 3.4 Diffraction Methods.</p> <p>4. Adsorption</p> <p>4.1 Types of adsorption and adsorption times. Classification of adsorption isotherms. 4.2 Thermodynamics of adsorption.</p>	<p>7 hr</p> <p>9 hr</p> <p>6 hr</p> <p>6 hr</p>

	<p>4.3 Adsorption Models. The potential theory of Polanyi. 4.4 Experimental aspects of adsorption from gas phase. 4.5 Adsorption on porous solids. 4.6 Adsorption from solution.</p> <p>5. Surfactants, Micelles, Emulsions and Thin films 5.1 Classification of surfactants. 5.2 Spherical micelles: cmc and influence of temperature. Thermodynamics of micellization. Structure of surfactant aggregates 5.3 Macroemulsions: properties, formation and stabilization. Evolution and aging. Coalescence and demulsification. 5.4 Microemulsions: size of droplets. Elastic properties of surfactant films. Factors influencing the structure of microemulsions.</p>	8 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<p>Text Book</p> <ol style="list-style-type: none"> 1. H J Butt, K. Graf and M. Kappl, Physics and Chemistry of Interfaces, Wiley-VCH, 2006. 2. A.W. Adamson and A.P. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Nanoscience: Concepts and Applications

Course Code: PCO-506

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/hours
Course Objectives:	1. Introduction of various concepts for nanoscience. 2. Introduction of various synthesis methods of nanomaterials. 3. Introduction of various characterisation techniques and application study of nanomaterials	
Course Outcomes:	Students will learn different techniques of synthesis and characterisation of nanomaterials. Students should be in a position to understand magnetic, electrical, optical and catalytic properties of materials at nanoscale level. Students should be in a position to apply the knowledge of subject for their dissertation and research work.	
Content:	1. Essential concepts and definitions Nanoscale, interdisciplinary nature of nanoscience, quantum effects, colours from colloidal gold, Surface to volume ratio of nanoparticles, surface effects and surface energy on nanoparticle surface. 2. Electronic and Electrical properties Chemistry of solid surfaces, Zero dimensional systems: nanoparticles One dimensional systems: nanowires and nanorods Metallic nanowires and quantum conductance. 3. Fabrication of nanoscale materials: top-down vs bottom-up approach i. Physical nanofabrication methods for the two dimensional nanostructures such as Thin film deposition of metallic copper, aluminium, tungsten and semiconducting silicon and Gallium arsenide films; Epitaxial growth; chemical vapour deposition and molecular beam epitaxial methods for the synthesis of semiconducting thin films, ii. Plasma Lithographic, photolithography, e-beam lithographic techniques for the transfer of circuit and nanopatterns on thin films. Positive and negative photoresists, different etching methods for the final pattern transfer on thin films. iii. Synthesis of colloidal metallic nanoparticles using different stabilizing and complexing agents such as citric acid and use of surfactants. iv. Discussion of Self assembly growth modes for thin films and colloidal nanoparticles : Stransky-Krastinova and Ostwald ripening	5 hr 5 hr 8 hr

	<p>4. Investigation of important nanomaterials:</p> <p>Silica: discussion of sol-gel and liquid crystal synthesis method, self assembly of colloidal silica particles, photoluminescence property of opals, different surface functionalization methods and application study</p> <p>Gold: Different colloidal synthesis methods, self assembly methods, surface Plasmon resonance (SPR) of colloidal gold nanoparticles surface functionalization strategies and application study</p> <p>CdSe: Different synthesis methods, synthesis of coreshell particles, Study of CdSe excitons and CdSe quantum dots, functionalization and application study.</p> <p>Iron oxide, Different synthesis methods Superparamagnetism property of nanoparticles, Hysteresis and magnetisation of Fe₃O₄ nanomaterial, catalytic and Biomedical applications.</p> <p>Carbon: synthesis methods for carbon nanotubes, Graphene and Buckminster fullerene, structural study of these materials, electrical property study of these materials, surface functionalization strategies and application study</p>	10 hr
	<p>5. Characterisation of nanomaterials</p> <p>i. Beam probe methods: Instrumentation, physical principle and different modes of operations in electron microscopic techniques such as Transmission electron microscope Scanning electron microscope and <i>Energy-dispersive X-ray spectroscopy</i>.</p> <p>ii. Electron and Scanning probe methods: Instrumentation, physical principle and different modes of operations in scanning tunnelling microscopy (STM) and Atomic force microscopy.</p> <p>iii. Optical Microscopes: Instrumentation, physical principle and different modes of operations in <i>Stimulated emission depletion (STED) microscopy</i> STED, Single molecule microscopy and <i>Dynamic light scattering (DLS)</i> is a technique.</p>	4 hr
	<p>6. Applications of nanomaterials</p> <p>Polymer vesicles for drug delivery, interaction of nanoparticles with DNA, Biosensors, Heterogeneous catalysts for the synthesis of fine chemicals, use of nano TiO₂ and ZnO for water and air pollution control.</p>	4 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

			HCO-510	Laboratory Course in Quality Control and Quality Assurance	4

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-501

Title of the Course: Pharmaceutical Chemistry II

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the course in Pharmaceutical Chemistry at T Y B Sc level.	
<u>Course Objective:</u>	To learn major classes of drugs and understand its SAR and Mechanism of action.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to identify the examples in different classes of drugs• Students should be able to write IUPAC names and Structure of drugs.• Students shall be in a position to understand the mechanism of action of selected classes of drugs.• The students will have a clear understanding of concepts on SAR analysis.• The students will be able to apply synthetic organic chemistry knowledge in devising a synthesis for a drug.	
<u>Content:</u>	<p>1. Cholinergic and Adrenergic Agents, General Anaesthetics and Hypotensive agents Drugs acting on cholinergic nervous system: Bethanechol, Methacholine\$, Neostigmine, Pyridostigmine, Parathion, Malathion, Atropine, Dicyclomine\$, Tropicamide\$, Papaverine, Drugs acting on adrenergic nervous system: Methyldopa (MA,\$), Guanethidine, Ephedrine, amphetamine, Tranylcypromine, Pragyline, Norepinephrine, Epinephrine, Pronetalol, Propanalol\$, Atenolol\$, Metoprolol. General Anaesthetics: Ether, Nitrous oxide, Halothane\$, Ultra short acting Barbiturates-Thiopental sodium \$. Hypotensive agents acting on vascular smooth muscles: Nitrites, Amyl nitrites, Glyceryl nitrite\$, Pentaerythritol tetranitrate, Isosorbide dinitrate.</p> <p>2. Drugs acting on the central nervous system: Hypnotics and sedatives: Chloral hydrate, Phenobarbital\$, Secobarbital, Thiopental\$, Nitrazepam, Drugs acting as anticonvulsants: Phenytoin\$, phenacemide, Clonazepam, Phensuximide, Phenobarbital, (Classification of Barbiturates), Primidone, Carbamazepine\$. Psychotherapeutic agents: Phenothiazines such as Chlorpromazine, Chlorodiazepoxide\$, Oxazepam, Diazepam, Imipramine, Nialamide, Tranylcypromine, Pargyline. CNS stimulants: Phenmetrazine, Nikethamide\$, Iproniazid, PicROTOXINES, Tetrazole, Amphetamine.</p> <p>3. Antihistaminics, antiemetic, antiulcer drugs, Drugs used parkinsonism and Alzhemeier's Diphenhydramine, Triprolidine, Cyclizine, Promethazine\$, Cimetidine, Omeprazole (MA),Ranitidine, Sumatriptan, Ondisiton.</p>	<p>10 hours</p> <p>10 hours</p> <p>05 hours</p>

	<p>Drugs used in Parkinsonism: Benztropine mesylate, Levodopa, Carbidopa, Amantadine hydrochloride. Drugs for Alzheimer's diseases: Serin, Velnacrine, Aniracetam.</p> <p>4. Cardiovascular drugs, antihypertensive agents, and antibiotics: Digitoxin, Quinidine, Procainamide, Verapamil. Antihypertensive agents which elicit their action through autonomous nervous system previously described under 1 and 2, clonidine, hydralazine, ACE inhibitors- Enalapril and related drugs vasodilators such as Nitroglycerine, Isosuprine, Nylidrin, Antibiotics: Penicillin and semisynthetic penicillins and Cephalosporins, Amoxicillin, Cloxacillin, Streptomycin, Chloromphenicol, Tetracycline and derivatives, Erythromycin.</p> <p>5. Analgesics, Antipyretics and Inflammatory agents: Analgesics, antipyretics and anti-inflammatory agents: Aspirin\$, Sodium salicylate, Acetaminophen\$, Phenacetin, Phenylbutazone, Oxyphenbutazone, Ibuprofen\$, Naproxen\$, Probenacid, Allopurinol, Profen, Diclofenac \$. Narcotic analgesic agents: Morphine, Codeine, Levarphanol, Meperidine, Methadone, Dextropropoxyphene. Non-narcotic analgesic agents: Dextropropoxyphene morphine antagonist n-allyl-nor morphine, Levallorphan.</p> <p>Note: \$- Synthesis to be studied.</p>	<p>05 hours</p> <p>06 hours</p>
<u>Pedagogy:</u>	Mainly Lectures & tutorials. Seminars/ assignments/ presentations/ self-study/group discussion or a combination of some of these could also be used to some extent.	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. D. A. Williams & T. L. Lemke, <i>Foye's Principles of Medicinal Chemistry</i>, Lippincott Williams and Wilkins. 2006, 5th Ed. 2. Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-502

Title of the Course: Drug Product Formulation and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on drug formulations	
<u>Course Objective:</u>	To understand the concept of drug dosage forms types of formulations and pilot plant process. To study the drug formulation development with specific examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">Students should be able to formulate drugsStudents should be able to apply this knowledge for formulation experiments in laboratory.	
<u>Content:</u>	1. Introduction and Classification: Introduction to drugs, Dosage Forms & Drug Delivery system – Definitions of Common terms. Drug Regulation and control, pharmacopoeias-formularies, sources of drug, drug nomenclature, routes of administration of drugs products, need for a dosage form, classification of dosage forms & brief description, study of excipients.	08 hours
	2. Drug Product Development Preformulation studies, objectives, factors to be considered, study protocol. Brief discussion on various parameters to be investigated. formulation and development of the dosage form/drug delivery system-general consideration.	08 hours
	3. Pilot plant Scale up techniques, Benefits of pilot plant- Broad guidelines of process development. General Consideration. Industrial manufacturing method and flow charts of sulphamethoxazole, Rifampicin, Chloramphenicol maleate.	08 hours
	4. Pharmaceutical manufacturing operations Brief discussion on unit operations and types of equipments/ machines used. Unit operations like size reduction, mixing/blending, drying, compression etc.	06 hours
	5. Dosage forms-formulation components, manufacturing and QC Liquids-monophase & biophase including ENT preparation. Semisolid e.g. Ointment, creams, gels etc. Solid dosage forms, e.g. Tablets, capsules, granules & powders. Sterile dosage forms, e.g. Injectables and ophthalmic preparations.	06 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations will be acquired methods for learning.	
<u>References/Readings</u>	1. Allen Popovich & Ansel, <i>Ansel's Pharmaceutical Dosage forms and Drug Delivery System</i> , B.I. Publication Pvt . Ltd, 2005,

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-503

Title of the Course: Drug Design and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of the concept of drug design and the need for it.	
<u>Course Objective:</u>	To make the students well versed with theories of drug action. To make the students understand the Structure Activity Relationship studies with respect to various examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to explain the theories of drug action.• Students should be able to apply Quantitative Structure Activity Relationship knowledge in drug designing• Students should be able to analyze the effect of different functional groups on the biological activity of drugs• The students will have a clear understanding of concepts on SAR analysis.• The students should be able to illustrate an example of drug designing by molecular modeling.• The students will be able to understand the terms in patents.	
<u>Content:</u>	1. Introduction to Drug design, Lead compounds and Pro-Drug Concept. Development of new drugs: Introduction, procedure followed in drug design, the search for lead compounds, molecular modification of lead compounds, prodrugs and soft drugs, prodrug; introduction, prodrug formation of compounds containing various chemical groups, multiple prodrug formation, soft drugs; design of soft drugs.	08 hours
	2. SAR and QSAR Studies in drug discovery Structure-Activity Relationship (SAR): Factors effecting bioactivity, resonance, inductive effect, isoterism, bioisosterism, spatial considerations, biological properties of simple functional groups. 4-5 illustrative examples depicting structural activity relationship studies. Theories of drug activity, occupancy theory, rate theory, induced-fit theory. Quantitative structure-activity relationship (QSAR): history and development of QSAR, drug receptor interactions, the additivity of group contributions, physico-chemical parameters, lipophilicity parameters, electronic parameter, ionization constants, steric parameters, chelation parameters, redox potential, indicator-variables, quantitative models.	08 hours
	3. QSAR Approaches in drug designing and modern methods in discovery Hansch analysis- Advantages and drawbacks. Free-Wilson	08 hours

	<p>analysis, Advantages and drawbacks. Their application, relationship between Hansch and Free-Wilson analysis (the mixed approach), non-linear relationship, Introduction to other QSAR approaches- Free Topliss Method-Postulates and Illustration. Introduction to molecular modeling using computers and docking, uses of molecular modeling manual use, further computer programming.</p> <p>4. Designing of Enzyme Inhibitors Structure-based drug design: Process of structure based drug design, deactivation of certain drugs necessary for T cell functioning, determination of the active site with special reference to chymotrypsin, design of inhibitors. Design of Enzyme Inhibitors, 9-alkylpurines, 9-mercaptopurines and allopurines, active site directed irreversible enzyme inhibition, suicide enzyme inactivators.</p> <p>5. Development of New drugs High throughput screening. Drug Design softwares and its applications. Intellectual property rights, patents, industrial designs, geographical indications, trademarks, trade secrets. Patentable inventions. Patentable drugs. Role of patents in Pharmaceutical industry. trade related aspects (TRIPS), international & regional agreements. Examples of new drugs developed.</p>	<p>06 hours</p> <p>06 hours</p>
Pedagogy:	Lectures assignments presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-505

Title of the Course: Laboratory Course in Pharmaceutical Chemistry

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have undergone practical course in pharmaceutical chemistry at TYBSc. Level.	
<u>Course Objective:</u>	To apply the theoretical knowledge of pharmaceutical chemistry for synthesis.	
<u>Course Outcome</u>	A Student should be able to apply synthetic organic chemistry knowledge for synthesis of drug like compounds.	
<u>Content:</u>	1. Methods for synthesis of pharmaceutical compounds. a) Acetylation of p-aminophenol to acetanilide b) Esterification of salicylic acid c) Benzoylation of alanine/L-Cysteine d) Diazotisation of m-nitroaniline and coupling to give azo dye e) Schiff bases from 2-aminophenol and p-bromobenzaldehyde f) Sulphonylation of aniline/phenol	16 hours
	2. Synthesis of bioactive heterocycles a) 2-Methyl Benzimidazole from o-phenylene diamine b) 2,3-DiphenylQuinoxaline from Benzil c) Dilantin from Benzil and urea d) 7-Hydroxycoumarin from ethylacetoacetate e) Barbiturate from diethyl-n-butylmalonate f) Flavone from 2-hydroxyacetophenone g) Benzoxazole from 2-aminophenol h) Synthesis of Phenothiazine derivative	36 hours
	3. Synthesis of medicinal compounds a) Synthesis of Propranolol from α -Naphthol b) Synthesis of Sorbic acid from crotonaldehyde c) Synthesis of Dichloramine-T and Chloramine-T d) Synthesis of Eosin from Fluorescein e) Synthesis of Gramine from Indole	20 hours

<u>Pedagogy:</u>	Laboratory work well understood by pre-lab and post-lab assignments.	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. K.A. Connors, <i>Text book of Pharmaceutical analysis</i>, Wiley Interscience Publication 1990, 3rd Ed. 2. J. Bassett, J. Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-501

Title of the Course: Pharmacological and Toxicological Screening Techniques

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of Biological Chemistry	
<u>Course Objective:</u>	To learn screening methods of biological Assay. To learn terms involved in Toxicology. To learn methods of analysis for Toxicology.	
<u>Course Outcome</u>	A student will be able to apply the role of various screening methods in bioassay. A student will be able to create various in vivo and in vitro assay methods for various targets. A student will be able to evaluate various effects of toxicology.	
<u>Content:</u>	1. Principles of Biological Standardisation, Screening methods Statistical treatment of model problems in evaluation of drugs-methods of biological assay, principles of biological assays-methods used in bioassay of vitamins, hormones, vaccines, cardiac drugs and other pharmacopoeial preparations. Organisation of Screening for the pharmacological activity of new substances. Anti-inflammatory agents-carrageenan induced paw oedema, cotton pellet method. Anticonvulsants: Convulsions induced by chemicals, induced by electroshock, combined procedures. Sympatomimetic agents: Mydriasis, the uterus and ascending colon of the rat.	12 hours
	2. Introduction to Toxicology: Definition and types of toxicology, Basic principles of toxicology, Carcinogenicity, mutagenicity, teratogenicity, acute, sub acute and chronic toxicity. Detailed toxicity(mild/moderate/severe toxicity wherever applicable) and treatment of drugs such as salicylates/ paracetamol, opium, quinine, ethyl alcohol, etc. Toxic chemicals in the environment, impact of toxic chemicals on enzymes. Biochemical effects of arsenic, lead mercury, cadmium, carbon monoxide, pesticides and carcinogens.	12 hours
	3. Essentials of Analytical Toxicology Physicochemical, biochemical & genetic basis of toxicity; Principles of toxicokinetics, mutagenesis and carcinogenesis – Behavioural, inhalation toxicity, hypersensitivity and immune response, range finding tests – Acute, subacute and chronic toxicity studies. Classification of Toxins: Acute toxicity tests, Determination of LD ₅₀ value, Subacute tests - Histopathological and biochemical estimations on toxicity induced in animal models – Modern methods of analysis for Toxins-Barbiturate poisoning, Amphetamine poisoning.	12 hours

<u>Pedagogy:</u>	Lectures, assignments, presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-502

Title of the Course: Calibration and Validation

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied practical course involving calibration of analytical instruments	
<u>Course Objective:</u>	To learn principles of calibration and validation of analytical instruments. To learn validation procedures for analytical instruments. To learn qualification of various analytical instruments.	
<u>Course Outcome</u>	A student will be able to apply calibration techniques to analytical instruments. A student will be able to validate analytical instruments. A student will be able to evaluate qualifications of analytical instruments.	
<u>Content:</u>	1. Calibration and Validation of Analytical Instruments Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Regulatory requirements for analytical method validation. International conference on harmonization (ICH) guideline Q2A:	12 hours
	2. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	12 hours
	3. Qualification of analytical instruments Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and field visits will be the acquired methods for learning.	
<u>References/Readings</u>	1. WHO guidelines (2014-2018) 2. Michael E. Swartz, <i>Analytical Method Development & Validation</i> , CRC Press, 1997. 3. Loftus & Nash, <i>Pharmaceutical Process Validation</i> , Dekker Incorporated, Marcel, 1984.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-503

Title of the Course: Polymers in Pharmaceuticals and novel drug delivery systems

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the topic on polymers in the TYBSc. Level	
<u>Course Objective:</u>	To learn classification synthesis and properties of polymers. To learn the role of polymers in drug delivery systems. To learn new innovations in drug delivery systems.	
<u>Course Outcome</u>	A student will be able to identify the type of polymers that can be used for drug delivery systems. A student will be able to get the knowledge of innovative drug delivery systems and apply it for their lab project.	
<u>Content:</u>	1. Introduction and Types of Polymers in Pharmaceuticals Classification, General methods of synthesis, properties, characterization and evaluation: Biodegradable polymers - Classification - Mechanism of biodegradation in the body. Polymer processing with respect to novel formulation design: Applications of polymers in novel drug delivery systems. Introduction to Novel Drug delivery systems, drug delivery carriers, routes of administration.	12 hours
	2. Polymers as Novel Drug Delivery systems Recent advances in drug delivery systems. Theory of controlled release drug delivery systems. Microencapsulation – Methods of encapsulation. Transdermal drug delivery systems – Theory, formulation, production and evaluation. Targeted drug delivery systems – concept of drug targeting, importance in therapeutics.	12 hours
	3. Recent Innovations in drug delivery systems Recent innovations in conventional dosage form like tablets, capsules, sterile dosage forms, pellets, Mucoadhesive system, GRDDS, peptide drug delivery, supercritical fluid technique, PEGylation, Nanoparticulate drug delivery. Future opportunities and challenges.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and mini-projects will be the acquired methods for learning.

----------------------------	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-504

Title of the Course: Biopharmaceutics

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the concepts of drug metabolism at T Y B Sc level.	
<u>Course Objective:</u>	To learn ADMET. Drug absorption drug distribution Drug Action Drug metabolism and excretion To learn how bioavailability is important understanding the efficacy of a drug product.	
<u>Course Outcome</u>	A student will be able to relate drug absorption to bioavailability. A student will be able to get an in-depth knowledge of drug metabolism concept.	
<u>Content:</u>	1. Drug absorption, Dissolution and Distribution Based on cell membrane Gastro-intestinal absorption of drugs, mechanisms of drug absorption, factors affecting drug absorption: Biological, physiological, physico-chemical and pharmaceutical. Noyes-Whitney's dissolution rate law, study of various approaches to improve dissolution of poorly soluble drugs, In-vitro dissolution testing models, In-vitro-in-Vivo correlation. Factors affecting drug distribution, volume of distribution, protein binding – factors affecting, significance and kinetics of protein binding.	12 hours
	2. Drug Metabolism and Excretion Metabolism of drugs, Xenobiotics, Drug metabolizing organs and enzymes (microsomal & nonmicrosomal), Chemical pathways - Phase I reactions (Oxidative, reductive and hydrolytic reactions) and Phase II reactions (Conjugation), Significance of cytochrome P ₄₅₀ oxidation – reduction cycle, Factors affecting biotransformation of drugs. Renal excretion – Glomerular filtration, Active tubular secretion, Active (or) passive tubular reabsorption. Factors affecting renal excretions of drugs. Non renal excretions – Biliary, pulmonary, salivary, mammary, skin/dermal, gastrointestinal and genital excretions of drugs (Any two types)	12 hours
	3. Bioavailability and Bioequivalency studies Objectives and considerations in bioavailability studies, Concept of equivalents, Measurements of bioavailability, Determination of the rate of absorption, Bioequivalence studies and its importance,. Biopharmaceutical classification of drugs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-505

Title of the Course: Pharmaceutical Technology

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on pharmaceutical technology.	
<u>Course Objective:</u>	To learn unit processes involving various chemical reactions. To learn industrial synthesis of selected list of drugs. To learn the need for pilot plant in industry and also the flowchart on various manufacturing methods of drugs.	
<u>Course Outcome</u>	A student will be able to explain unit processes for various chemical reactions. A student will be able to apply industrial synthesis knowledge for the synthesis of drug like molecules in laboratory. A student will be able to apply the knowledge of effluent treatment methods.	
<u>Content:</u>	1. Unit Processes Concept of unit processes in systematization of chemical reactions, explanation of one example each for unit processes: Alkylation, amination, (by ammonolysis, reduction), carbonylation, carboxylation, condensation, dehydration, diazotization, disproportionation, esterification, halogenation, hydration, hydroformylation, hydrogenation, hydrolysis, hydroxylation, nitration, oxidation and reduction. 2. Industrial Synthesis Introduction to pharmaceutical manufacturing – raw materials, detailed manufacturing procedure, therapeutic function, common name, chemical name, structural formulae of the following drugs :Acyclovir, alprazolam, propranolol, naproxen, ibuprofen, aspirin, levodopa and cimetidine. Lidocaine, ethambutal hydrochloride, 5-fluorouracil, amoxycillin sodium. 3. Process Development & Process Optimization a) Pilot- plant – Introduction – Appraisal for the need of pilot – plant – pilot plant (Vs) Small scale plant – Benefits of Pilot plant – Broad guidelines of process development. b) Industrial manufacturing method and flow charts of Sulphamethoxazole, Ciprofloxacin, and Rifampicin. Environment Health & Safety: Introduction to industrial effluents. Classification of effluents. Classification of basic methods of purifying effluents.	12 hours 12 hours 12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-506

Title of the Course: Pharmaceutical Stability

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied some knowledge on stability of drugs	
<u>Course Objective:</u>	To learn to predict shelf life and half life of pharmaceutical formulations. To learn various stability protocols and also stability terminologies as given in ICH guidelines I To learn ICH guideline II that is thorough investigation into stability labs.	
<u>Course Outcome</u>	A student will be able to explain fundamentals of stability studies. A student will be able to determine stability requirements for OTC drug products. A student will be able to make a stability labs ready for FDA inspection.	
<u>Content:</u>	1. Fundamentals of Stability Basic concept and objectives of stability study. Fundamentals of stability testing requirements. Order of reaction and their applications in predicting shelf life and half-life of Pharmaceutical formulations.	12 hours
	2. ICH Guidelines-I Review ICH process and ICH updates on stability Common terminology and acronyms. Review current Q1A, Q1B, Q1D, Q1F, Q2, Q3 and Q6 guidelines Determine stability requirements for OTC products Stability SOPs Stability protocols and data Design of a compliant bracketing and matrixing.	12 hours
	3. ICH Guidelines-II ICH guidelines on bracketing and matrixing Stability testing laboratory Design and validation stability test procedures Stability data management system Investigation procedures of OOS stability results FDA inspection of stability labs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group project will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-507

Title of the Course: Laboratory Course in Natural Product Analysis

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the theory topics in natural products at TYBSc. Level.	
<u>Course Objective:</u>	To introduce the practical component in natural product analysis. To learn various methods involved in the analysis of natural products.	
<u>Course Outcome</u>	A student will be able to Isolate natural products. A student will be able to synthesize natural products. A student will be able to characterize natural products by physical methods of analysis.	
<u>Content:</u>	<ol style="list-style-type: none">1) Isolation of Caffeine from tea, coffee etc. and purification by microscale sublimation. Characterization of pure caffeine by IR.2) Isolation of Cinnamaldehyde from Cinnamon by microscale steam distillation. Characterization and interpretation of isolated Cinnamaldehyde by IR.3) Enzymatic reduction of ethylacetoacetate using Baker's yeast.4) Thin layer Chromatography for separation of mixtures of natural products/Market Formulations.5) Column chromatography of two component mixture of natural products/Market Formulations.6) Conversion of camphene to isobornyl acetate7) Hydrolysis of isobornyl acetate to isoborneol8) Oxidation of isoborneol to Camphor.9) Transformation of Benzaldehyde to Benzoin using thiamine B12 as a coenzyme.10) Isolation of cholesterol from gallstones11) Determination of Acid Value of Fixed Oil.12) Determination of Saponification Value of Fixed Oil.13) Determination of Eugenol in Clove Oil.14) Qualitative analysis of natural products (Comprises of amino acids, carbohydrates, proteins, alkaloids, glycosides, steriods, flavonoids)15) Isolation of piperine from black pepper powder. Characterization and interpretation of isolated Cinnamaldehyde by IR.16) Isolation of calcium citrate from lemon juice.	48 hours
<u>Pedagogy:</u>	Laboratory work.. pre-lab and post-lab exercises mini-projects will be given to students.

Effective from AY: 2018-19

Prerequisites for the course:	Should have knowledge of drug dosage forms and drug formulations	
Course Objective:	To learn preparations of variety of pharmaceutical formulations. To learn quality control evaluation methods of tablets. To learn the principle instrumentation and working of dissolution apparatus.	
Course Outcome	A student will be able to prepare various drug formulations and analyze them. A student will be able to evaluate tablets qualitatively using analytical instruments. A student will be able to handle dissolution apparatus and carry out various dissolution experiments to evaluate bioavailability.	
Content:	<p>1) Preparation of pharmaceutical dosage forms and Quality Control Analysis other than Assays:</p> <ul style="list-style-type: none"> i) Concentrated Dill Water ii) Aqueous Iodine Solution I. P iii) Merbromin solution NF 11 iv) Cresol with soap solution I.P. v) Calamine Lotion IP vi) Calamine Cream aqueous BPC. vii) Elixir, Paediatric B.P.C. and Pain balm viii) Cough Expectorant and Antacid suspension ix) Simple ointment IP and Sulphur Ointment IP x) Non-Staining Iodine Ointment BPC and Non-staining iodine ointment with methyl salicylate (BPC) xi) Liniment (BPC) <p>2) Quality Control Evaluation of Tablets and Capsules</p> <p>6 experiments using different types of tablets and capsules of 4 hours each</p> <p>3) Dissolution Experiments</p> <ul style="list-style-type: none"> i) Validation, qualification, Calibration of dissolution Test Apparatus. ii) Carbamazepine tablets iii) Paracetamol tablets iv) Diclofenac sodium tablets v) Combination drugs 	<p>42 hours</p> <p>24 hours</p> <p>30 hours</p>
Pedagogy:	Laboratory work. pre-lab and post-lab exercises mini-projects will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-509

Title of the Course: Laboratory Course in Drug Design, Molecular Docking and Patents

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of structure drawing at T Y B Sc level.	
<u>Course Objective:</u>	To learn drug designing through drug discovery experiments (drug simulations) To learn to use molecular docking software packages. To learn about patenting in pharmaceuticals.	
<u>Course Outcome</u>	A student will be able to synthesize drug molecules carry out in vitro bioassay and drug simulation studies. A student will be able use various molecular docking softwares for designing certain drug targets. A student will be able to know the procedure to pharmaceutical patent can be filed.	
<u>Content:</u>	1) Drug Design and Discovery experiments 1. Synthesis of Aspirin and Oil of Winter green and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 2. Synthesis of Sulphacetamide and Sulphamethoxazole and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 3. Synthesis of acetanilide and paracetamol and its physical properties, <i>in vitro</i> biological assays and drug simulation studies.	16 hours
	2) Molecular Docking Experiments Use of software packages in chemistry for the following: To write a computer program to obtain a slope and intercept for linear data using least square fit. 1. Use of ChemDraw, ISISDraw for drawing structures, chemical reactions, equations. 2. Molecular docking softwares such as Hex software or autodocking. 3. Energy minimization of molecules and finding intermolecular interactions of small molecule with macromolecule such as inhibitor, thymidilate synthase, glycogen synthase, E.Coli protease. 4. Viewing Tools and Graphics Tools • Rasmol (http://www.umass.edu/microbio/rasmol/) • VMD (http://www.ks.uiuc.edu/Research/vmd/) • Molscrip (http://www.avatar.se/molscrip/) 6. The use of molecular dynamics techniques for drug discovery using NAMD (http://www.ks.uiuc.edu/Research/namd/). Tutorials are at http://www.ks.uiuc.edu/Training/Tutorials/ . 7. Docking of small molecules to protein targets using Autodock	24 hours

	<p>(http://autodock.scripps.edu/). Tutorials are at http://autodock.scripps.edu/faqshelp/tutorial/using-autodock-4-with-autodocktools.</p> <p>3) Patents</p> <ul style="list-style-type: none"> i) Prior Art Search on Target Drug (Any 2) ii) Patent Filing procedures (Any two case studies) 	8 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-510

Title of the Course: Laboratory Course in Quality Control and Quality Assurance

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the analysis of pharmaceuticals at TYBSc. Level.	
<u>Course Objective:</u>	To learn quality control analysis of drugs using analytical instruments. To learn to perform quality assurance experiments	
<u>Course Outcome</u>	A student will be able to use UV spectrophotometer dissolution apparatus high performance liquid chromatograph (HPLC) and Infra Red spectrophotometer. For quality control analysis of drugs. A student will be able to perform quality assurance experiments.	
<u>Content:</u>	I) Quality Control Analysis Experiments Spectrophotometric Analysis 1) Determination of % purity of a given sample of Chloramphenicol capsules IP. 2) Determination of % purity of a given sample of Furosemide injection IP. 3) Determination of % purity of a given sample of Allopurinol tablets IP. 4) Determination of % purity of a given sample of Propranolol HCl tablets IP.	16 hours
	Dissolution Analysis (Any 2) 1) Dissolution rate study of sustained release Theophylline tablets IP. 2) Dissolution rate study of sustained release Diclofenac tablets IP. 3) Analysis of Diclofenac sodium and paracetamol in combined dosage form.	12 hours
	Chromatographic Techniques in Pharmaceuticals: 1) To identify the given drug amongst the paracetamol, aspirin and caffeine citrate with the help of thin layer chromatography and calculate its <i>R_f</i> value. 2) To identify the given sulpha drug among the sulphadiazine, sulphamethoxazole and trimethoprim with the help of thin layer chromatography and calculate its <i>R_f</i> value. 3) To perform the Separation of amino acids by paper chromatography. 4) To identify the given sample of sugar with the help of ascending paper chromatography and calculate its <i>R_f</i> value. 5) To demonstrate high Performance liquid chromatography and analyse Diazepam Tablets by High Pressure Liquid Chromatography.	24 hours

	6) To develop and validate the analytical method of any one drug using high performance liquid chromatography. 7) To analyze the given tablets of paracetamol/ibuprofen-paracetamol combination HPTLC method. 8) Separation of mixture of o-nitroaniline and p-nitroaniline using column chromatography. Infrared Spectroscopic analysis Demonstration of Instrumentation and Interpretation of Representative Spectra a) To differentiate between analgesic-NSAIDs :Aspirin, Ibuprofen, Paracetamol. b) To differentiate between Acetophenone, p-Nitroacetophenone, Benzamide. c) To interpret the I.R. spectra of the following compounds: Benzyl alcohol, Benzaldehyde, Acetanilide, Ethylacetate, Ethyl methyl ketone, m-nitroaniline.	8 hours
	II) Quality Assurance Experiments (Any 9) 1) Evaluation of Riboflavin/Ibuprofen tablets I .P. to characterize and evaluate the effect of different concentrations of binders and disintegrant. 2) Design and fabrication of theophylline sustained release formulation and comparison of its release profile with the conventional dosage form. 3) Formulation and evaluation of micronized disperse system for parenteral delivery of drugs including test for pyrogens and sterility testing etc. 4) Preparation of solid dispersions of poorly water soluble drugs using different carriers and to study the release profile and compare with conventional dosage forms. 5) Disintegration and dissolution of per oral tablets. 6) Influence of vehicle on drug availability from topical dosage forms in-vitro. 7) Design and preparation of a suspension and its evaluation. 8) Development of moisture resistant coating formulation for Amoxycillin tablets/ Ranitidine tablets. 9) Quality control of paper, Plastic and glass container. 10)Quality control of labels and label adhesives. 11)Microbial limit test in oral products. 12)Validation of sterilization equipments e.g. Hot air oven, Autoclave. 13)Validation of Analytical procedure.	36 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations and case studies will be given to students.

Programme: M. Sc. Part-II (Chemistry)

Course Code: CGO-501

Title of the Course: Selected Experiments in Chemistry

Number of Credits: 8

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the theory and practical courses in Analytical, Inorganic, Organic and Physical Chemistry at MSc-I level so as to have basic knowledge of experiments in chemistry.	
Course Objectives:	<p><i>This course is in lieu of Dissertation (8 credits) and is to be opted by those students who are not opting the dissertation at part-II level. Consequently, the course will be taught over two semesters (III and IV, 4 credits in each semester). The objectives and outcomes are thus defined considering the requirements of experimental Analytical, Inorganic, Organic and Physical Chemistry.</i></p> <ol style="list-style-type: none">1. Introduction of various instrumental techniques for analysis.2. Learning data analysis, handling and interpretation of spectra.3. To learn techniques of crystallization of ligands and synthesis of coordination compounds.4. To learn characterization of compounds using different instruments.5. To introduce analysis of ores for metal content.6. To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.7. To train the students in application of theoretical concepts related to organic spectroscopy by interpreting various spectra (UV, IR, NMR, Mass, 2D NMR etc.) of organic compounds.8. To impart experimental knowledge regarding computational and theoretical concepts in physical chemistry.9. To introduce synthesis methods of nanomaterials and nanoporous materials.10. To introduce computational techniques in physical chemistry.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to use different instruments for qualitative and quantitative analysis.2. To gain experience with some statistics to analyse data in lab.3. Students will be able to understand the methods of syntheses and characterization of coordination compounds4. Students will be in a position to synthesis, characterize and measure the solid state properties of oxide materials.5. Students shall gain the understanding of:<ol style="list-style-type: none">i. Stoichiometric requirements during organic syntheses.ii. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.iii. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of	

	<ul style="list-style-type: none"> ii. Benzidine from hydrazobenzene (benzidine rearrangement). iii. Methyl orange/red from sulphanilic acid/anthranilic acid (diazotization). iv. Benzil to hydrobenzoin (NaBH_4 reduction). v. Photochemical transformation of benzophenone to Benzpinacol. vi. 2-(4-Methyl benzoyl) benzoic acid from phthalic anhydride and toluene (F-C reaction). vii. 2-(4-Methyl benzoyl) benzoic acid to methyl anthraquinone (PPA cyclisation). viii. Resolution of racemic phenyl ethylamine using tartaric acid. ix. Trans-Stilbene by Wittig reaction. x. Enamine alkylation :2- methyl cyclohexanone pyrrolidine enamine with CH_3I. <p>Unit IV: Physical Chemistry</p> <p>I. Computational Chemistry (Any Three Experiments.)</p> <ul style="list-style-type: none"> 1. Plotting various types of graphs viz. straight lines, exponential, Gaussians, orbitals, first and second derivative plots. 2. Working with molecular coordinates: Distance matrix, center of mass, bond angles, dihedral angles, bond lengths, moment of inertia. 3. Electronic Structure of Diborane using the nwchem default density functional and basis sets. 4. Vibrational Spectroscopy of Transition Metal Nitrosyls complexes using ab initio calculations. <p>II. Experimental physical chemistry (Any Five Experiments)</p> <ul style="list-style-type: none"> 1. Preparation of a transition metal oxide (ZnO / NiO) by three different precursors and their characterization by IR and XRD. 2. Synthesis of a photo catalyst (TiO_2 / ZnO) by two different precursors and study kinetics of adsorption and photocatalytic degradation of a suitable azo dye as pollutant. 3. Adsorption studies on the porous adsorbents and fitting the adsorption data using Freundlich and Langmuir adsorption isotherms. 4. To study the thermodynamics of the adsorption process and to determine thermodynamic parameters such as ΔS and ΔG of the adsorption process. 5. Synthesis of spherical and rod shaped colloidal silver nanoparticles and to perform stability and surface plasmon resonance (SPR) analysis using UV-vis spectrophotometer. 6. To study the three component system such as chloroform, acetic acid and water and to obtain tie lines and plait point. Plotting the composition of mixture on a ternary phase diagram. 	<p>18 hrs</p> <p>30 hrs</p>
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

--	--	--

Note: The course would be taught over entire academic year with practicals from any two specializations in odd semester (III) and remaining two in the even (IV) semester. The ISA and SEA would be conducted in each of the semesters and final marks will be computed only at the end of even semester. Thus, students opting the course will be divided in to four batches and two of them together will undertake practicals in two specializations in one semester and remaining two in the next semester.

M.Sc. Biochemistry revised syllabus with effect from A.Y. 2021-2022

Core Papers			
Sl. No.	Subject code	Paper title	Credits
1.	BCC 101	Fundamentals of Biomolecules [T]	3
2.	BCC 103	Analytical Biochemistry-I [T]	3
3.	BCC 106	Bioenergetics and metabolism [T]	3
4.	BCC 107	Molecular Biology [T]	3
5.	BCC 108	Laboratory course in Biochemistry-I	4
		a. Fundamentals of Biomolecules [P]	
		b. Analytical Biochemistry-I [P]	
		c. Molecular Biology [P]	
		d. Field trip/study tour [P]	
Optional Papers			
1.	BCO 110	Immunology and Immunotechniques [T]	3
2.	BCO 111	Biochemistry of Environmental Pollution and Remediation [T]	3
3.	BCO 124	Cell biology [T]	3
4.	BCO 125	Analytical Biochemistry-II	3
5.	BCO 126	Laboratory techniques and Applications of Biochemistry	4
		a. Cell biology [P]	
		b. Immunology and Immunotechniques [P]

		d. Biochemistry of Environmental Pollution and Remediation [P]	

PART -I CORE PAPERS

Programme: M. Sc. (Biochemistry)

Course Code: BCC 101

Title of the Course: Fundamentals of Biomolecules [T]

Number of Credits: 3

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Students should have basic knowledge of organic and biomolecules and some of the functional groups and stereochemistry.	
<u>Course Objectives:</u>	<ol style="list-style-type: none"> 1. To develop concepts about structures and functions of different biomolecules. 2. To understand the reactivity of biomolecules and their role in metabolic pathways. 	
<u>Course Outcomes:</u>	Students will acquire insights into the structure and functions of various biomolecules and their 3-dimensional arrangements. Students will be able to understand the reactivity of biomolecules which will help them in better understanding of the metabolic pathways.	
<u>Content:</u>	<p>1. Introduction: Origin, aim and scope of Biochemistry</p> <p>Properties of water: Structure and properties of water, importance of water in biological systems, Ionic product of water.</p> <p>2. Chemical bonding, Stereochemistry and Reactions:</p> <p>Properties of covalent bond, non-covalent bonds and their importance in biological systems. Brief revision of configurational nomenclature: R & S; D & L; E & Z; cis & trans and syn & anti nomenclature with respect to biomolecules. Types of biochemical reactions: oxidation-reduction, condensation, rearrangement, cleavage, group-transfer, Resonance bond, electrophilic and nucleophilic substitution reactions.</p> <p>3. Amino acids and Protein:</p> <p>Amino acids: Structure, Classification, and physico-chemical properties of amino acids, role of non-protein amino acids,</p>	<p>3 h</p> <p>6 h</p> <p>7 h</p>

	<p>peptides, peptides of physiological significance, peptide bond.</p> <p>Proteins: Structural features of proteins and their biological functions</p> <p>a. Primary Structure: Peptide bond, importance of primary structure.</p> <p>b. Secondary structure: alpha-helix, β - structure, β-helix, super secondary structure.</p> <p>c. Tertiary Structure: Forces stabilizing, unfolding/ refolding</p> <p>d. Quaternary structure – Haemoglobin.</p> <p>4. Nucleotides and Nucleic acids: Structure and properties of nucleotides, nucleosides, purine (Adenine, Guanine) and pyrimidine (Cytosine, Thiamine, Uracil) bases. Structural features of nucleic acids (DNA & RNA) and their biological functions.</p> <p>5. Carbohydrates: Structure, stereochemistry, reactions and functions of monosaccharides, disaccharides polysaccharides and complex carbohydrates; amino sugars, proteoglycans and glycoproteins.</p> <p>6. Lipids: Classification, structure and function of major lipid subclasses-Triacylglycerols, Phospholipids, Sphingolipids, glycolipids, Lipoproteins, chylomicrons, LDL, HDL and VLDL, steroids, prostaglandins and bile acids, rancidity.</p> <p>Formation of micelles, monolayers, bilayer, liposomes.</p> <p>7. Vitamins: Structure and Classification, water soluble and fat soluble vitamins.</p>	<p>5 h</p> <p>6 h</p> <p>6 h</p> <p>3 h</p>
Pedagogy:	Lectures/ tutorials/ assignments/ students' seminars/ interactive learning/ self-study.

Programme: M. Sc. (Biochemistry)

Course Code: BCC 103

Title of the Course: Analytical Biochemistry-I

Number of Credits: 3

Effective from AY: 2020-21

<u>Prerequisites</u> for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques. It is assumed that students have a basic knowledge of fundamentals in biochemistry.	
<u>Course Objectives:</u>	<ol style="list-style-type: none"> 1. Introduction of various bioanalytical techniques for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool. 3. This course develops concepts in techniques used for routine biochemical work such as chromatography, centrifugation, electrophoresis. 	
<u>Course Outcomes:</u>	<ol style="list-style-type: none"> 1. Students should be in a position to differentiate between various analytical techniques based on their theory and sensitivity achieved. 2. Explain the principles of various techniques and apply the knowledge of the techniques for designing various experiments in research and development. 	

<u>Content:</u>	<p>1. Acid, bases and buffers: concept of pH, eh, acid-base associations, buffers, buffering capacity, mechanism of dissociation of macromolecules, dissociation constants, pKa, pi, solvents (eluotropic series), peroxide values, solubility and affinity constants. 6 h</p> <p>2. Centrifugation: Principle of centrifugation, concepts of RCF, different types of instruments and rotors, preparative, differential and density gradient centrifugation, analytical ultra-centrifugation, determination of molecular weights and other applications, subcellular fractionation. 5 h</p> <p>3. Electrophoretic techniques: Principles of electrophoretic separation. Types of electrophoresis including paper, cellulose, acetate/nitrate and gel. Slab gel, tube, Continuous and discontinuous. 8 h</p> <p>Gel electrophoresis - types of gel, Agarose GE, Polyacrylamide gel electrophoresis PAGE, SDS- PAGE, Isoelectric Focusing and ampholytes, 2-D, native, gradient gels, PFGE, DGGE, TGGE.</p> <p>Capillary electrophoresis-instrumentation, sample introduction in CE, types of CE methodology, electrophoretic mobility and electroosmotic mobility, total mobility, efficiency and resolution in CE column.</p> <p>Separation of neutral molecule by MEKC.</p> <p>Staining strategies and procedures: Coomassie Brilliant blue R/G 250, Silver, Fluorescent stains Flamingo, Oriole, SYPRO-Ruby; Stain-free gels.</p> <p>4. Separation techniques:</p> <p>Solvent extraction: Basic principle, types of extractions and application. Separations based on a partitioning between phases based on chemical nature and polarity of analyte. 7 h</p> <p>Dialysis: Principles, and applications of equilibrium dialysis and ultrafiltration. Artificial membranes, semi-permeable membranes, Donnan membrane equilibrium, and biological</p>	
------------------------	--	--

	<p>significance of osmosis and micelles.</p> <p>5. Chromatographic techniques: Basic principles and application of thin-layer, paper chromatography, column chromatography, HPLC, GC, separation matrixes - Ion-exchange, Affinity, Molecular exclusion and Adsorption (hydrophobic interaction chromatography, DNA cellulose chromatography, MAK hydroxyl-apatite chromatography). Concept of mobile phases; gradient elution (concave, convex and linear) and stationary phases</p>	10h
Pedagogy:	Lectures (online or physical)/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Biochemistry)

Course Code: BCC 106

Title of the Course: Bioenergetics and Metabolism [T]

Number of Credits: 3

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Students should have basic knowledge of biomolecules.	
<u>Course Objectives:</u>	To understand the metabolism of biomolecules and their regulation in living cells.	
<u>Course Outcomes:</u>	Students will be able to understand the pathways associated with the degradation and biosynthesis of major macromolecules in living beings.	
<u>Content:</u>	<p>1. Bioenergetics</p> <p>Thermodynamics: laws of thermodynamics, mechanism of exergonic and endergonic reactions, redox potential, high energy compounds, ATP structure and significance.</p> <p>2. Oxidative Phosphorylation</p> <p>Redox enzymes, aerobic electron transport and oxidative phosphorylation, ATP synthase and mechanism.</p> <p>3. Carbohydrate metabolism</p> <p>Regulatory mechanisms, bioenergetics and significance of central pathways of carbohydrate metabolism –</p> <p>Glycolysis</p> <p>Citric acid cycle, Gluconeogenesis from TCA intermediates / amino acids / acetyl-CoA.</p> <p>Pentose phosphate pathway, glyoxalate cycle, glucuronic acid pathway,</p> <p>Utilization of sugars such as lactose, galactose, maltose and of polysaccharides such as starch, glycogen.</p> <p>Biosynthesis of polysaccharides and sugar interconversions.</p> <p>4. Lipid metabolism Oxidation of fatty acids and its energetics: oxidation of saturated and unsaturated (mono and poly unsaturated fatty acids (PUFA), Peroxisomal oxidation of fatty acids (Phytanic acid), Refsum's disease, ketone body formation and their clinical</p>	<p>4 h</p> <p>2 h</p> <p>10 h</p> <p>8 h</p>

	<p>significance, diabetic keto acidosis, Biosynthesis of fatty acids and regulation, Biosynthesis of triglycerides, cholesterol and phospholipids.</p> <p>5. Nucleotides and Nucleic Acids</p> <p>Purine and pyrimidine nucleotides: biosynthesis and its regulation.</p> <p>Deoxyribo nucleotides: biosynthesis and regulation.</p> <p>Biosynthesis of nucleotide coenzymes.</p> <p>Catabolism of purine and pyrimidine nucleotides.</p> <p>6. Amino acids</p> <p>General reactions of amino acid metabolism - Transamination, decarboxylation,</p> <p>Oxidative and non-oxidative deamination of amino acids.</p> <p>Special metabolism of methionine, histidine, phenylalanine, tyrosine, tryptophan, lysine, valine, leucine, isoleucine and polyamines. Urea cycle and its regulation.</p> <p>Overview of biosynthetic pathways of amino acids and their regulation;</p> <p>Assimilation of ammonia, biosynthesis of essential and non-essential amino acids, regulation of glutamine synthetase and aspartate family of amino acids.</p>	<p>5 h</p> <p>7 h</p>
Pedagogy:	Lectures/ tutorials/ assignments/ students' seminars/ interactive learning/ self-study.	
Text Books/ References / Readings	<ol style="list-style-type: none"> 1. Nelson, D. L.; Cox, M. M.; Lehninger Principles of Biochemistry, W.H.Freeman; 2017, 7th Edition. 2. Voet, D.; Voet, J. Programme: M. Sc. Biochemistry

Course Code: BCC 107

Title of the Course: Molecular Biology [T]

Number of Credits: 3

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Students should have basic knowledge of genetics.	
<u>Course Objective:</u>	To acquaint students on the basic concepts of molecular biology. It explains the structure of nucleic acids, their packaging inside living cells and viruses, damages caused to DNA, the repair mechanisms initiated by the cell, the expression and regulation of genes in prokaryotes and eukaryotes.	
<u>Course Outcome</u>	The student will be able to understand the fundamental concepts of genetics and will gain an understanding on the flow of genetic information in viruses, prokaryotes and eukaryotes.	
<u>Content:</u>	<p>1. Structure of nucleic acid</p> <p>Structure of DNA and RNA, Types of DNA based on their structure and their importance in cell (A-DNA, B-DNA, Z-DNA), Types of DNA based on the functionality and their importance in cell (Satellite DNA, Palindrome DNA, Repetitive DNA), Types of RNA (mRNA, antisense mRNA, rRNA, tRNA), Fundamental functions of DNA.</p> <p>2. Packaging of nucleic material: Packaging of nucleic material in viruses (icosahedral capsid and helical capsids), Packaging of nucleic acids in prokaryotes (supercoiling, nucleosomes and nonhistone proteins), <i>Escherichia coli</i> as a model prokaryotic organism, Packaging of nucleic acids in eukaryotes to form chromosomes (supercoiling, nucleosomes, histones, chromatin and chromosome), Yeast as a model eukaryotic organism, Importance of structural features of chromosome (telomere, centromere and repetitive sequences), Functions of the chromosomes.</p>	<p>6h</p> <p>6h</p>

	<p>3. DNA damage by mutations, repair and recombination mechanisms</p> <p>Types of mutations (point mutations, frameshift mutations, forward mutations, reverse mutations, suppressor mutations, transitions and transversions), Role of Mutagenic agents (spontaneous and induced mutagenic agents), DNA repair mechanisms/ pathways: (Base excision repair, Mismatch repair, SOS repair, Photoreactivation repair, recombination repair, Mechanisms of Genetic recombination: Homologous and site-specific recombination, Role of synaptonemal complex, lamp brush chromosomes, chi sequences, Rec BCD system, Role of Rec A, Ruv C, Holliday junctions.</p> <p>4. Flow of genetic information and expression of genes in prokaryotes and eukaryotes:</p> <p>Central Dogma of flow of genetic information, replication of DNA, Transcription of RNA, synthesis and processing (transcription factors and machinery, formation of initiation complex, transcription activator and repressor, RNA polymerases, capping, elongation, and termination, RNA to proteins (reverse transcription).</p> <p>Post transcriptional attenuation, riboswitches, alternate splicing, RNA interference, RNA processing, RNA editing, and polyadenylation, structure and function of different types of RNA, RNA transport.</p> <p>Translation of mRNA to proteins: Structure of Ribosome (eukaryotes and prokaryotes), formation of initiation complex, initiation factors and their regulation, elongation and elongation factors, termination, genetic code, aminoacylation of tRNA, tRNA-identity, aminoacyl tRNA synthetase, and translational proof-reading, translational inhibitors, Post translational modification of proteins in prokaryotes and Eukaryotes.</p> <p>Control of gene expression at transcription and translation level: regulating the expression of phages, viruses, prokaryotic and</p>	<p>12 h</p> <p>12 h</p>
--	---	---------------------------------------

	eukaryotic genes, role of chromatin in gene expression and gene silencing. Role of Recognition sequences or motifs of gene regulatory proteins; Genetic switches and their role in gene expression.	
<u>Pedagogy:</u>	Lectures (online or physical)/ tutorials/laboratory work/ field work/ project work/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Biochemistry)

Course Code: BCC 108

Title of the Course: Laboratory course in Biochemistry-I

Number of Credits: 4

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Should have studied the theoretical concepts in respective Biochemistry courses.	
<u>Course Objectives</u>	<ol style="list-style-type: none"> 1. This course develops basic understanding and skills of various instruments and techniques in biochemistry, analysing biomolecules, Analytical biochemistry and Molecular biology. 2. The course aims to provide knowledge about the on-going research in various national research institutes and the functioning of industries and industrial processes and also to 	

	understand the job prospects in research institutes and industries.	
<u>Course Outcomes</u>	<ol style="list-style-type: none"> 1. Fundamentals of Biomolecules unit of the practical will train the students with skilful handling and estimating biomolecules and other metabolic products. 2. Analytical Biochemistry-I part of this practical will explain the principle and working of basic instruments in analytical laboratory that will train the students in handling various instruments in Analysis. 3. Molecular Biology unit of the practical will teach the students techniques involved in genomic DNA isolation and PCR amplification for its use in molecular research. 4. Field trip/study tour unit of this course will help the students to understand the working of industries and research institutions and provide them an insight of the prospects available to them. The students will understand the activities and research being carried out in industries and research institutes which reflects the applications of biochemical principles. 	
<u>Content</u>		
	I. Biomolecules <ol style="list-style-type: none"> 1. Standard curve for glucose by DNSA and quantitative estimation of test sample. 2. Comparison of colorimetric methods for protein estimation – Biuret and Folin-Ciocalteu methods. 3. Estimation of total sugar by anthrone method. 4. Estimation of amino acids (ala, tyr, trp) and protein by direct spectroscopy. 5. Estimation of nucleic acid by direct spectroscopy. 	24 h
	II. Analytical Biochemistry-I <ol style="list-style-type: none"> 1. Calibration of pH meter/weighing balance. Preparation of buffers using pH meter and determination of pH of given sample 	24h

	2. Separation of lipids by thin layer chromatography 3. Column chromatographic separation of organic molecule. 4. Separation of molecules by HPLC. 5. Separation of compounds based on their chemical nature by solvent extraction.	
	III. Molecular Biology 1. Isolation of genomic DNA of bacterial cells, estimation of quantity and purity of DNA by spectrophotometry, and agarose gel electrophoresis. 2. PCR amplification of a specific gene using genomic DNA as a template and agarose gel analysis of PCR product to determine amplicon size.	24 h
	IV. Field trip/Study tour 1. Visit to Research/Academic Institutes: E.g., National Centre for Antarctic and Ocean Research [NCAOR], National Institute of Oceanography [NIO], BITS-Pilani, K.K. Birla, Goa campus and ICAR-Central Coastal Agricultural Research Institute (ICAR-CCARI) and such others. 2. Visits to Industries: Pharmaceutical industry, Agricultural farming, Food and beverage. 3. Report writing: Students are supposed to submit report based on above visits highlighting the following points: i. Instrumental facility available and their applications ii. Industrial processes and products iii. Quality checking parameters iv. Ongoing research work. 4. Evaluation: i. Every student is supposed to present his/ her report before the Committee suggested by the School Council. ii. Evaluation will be based on report writings, oral	24 h

	presentation and viva.	
Pedagogy:	Lectures/ tutorials/ laboratory work/ field work/ project work/ outreach activities/ viva/ seminars/ assignments/ term papers/ presentations.

M.Sc. BIOCHEMISTRY PART-I OPTIONAL PAPERS

Programme: M. Sc. (Biochemistry)

Course Code: BCO 110 **Title of the Course:** Immunology and Immunotechniques [T]

Number of Credits: 3

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Basic understanding of pathogens, blood cells and human physiology.	
<u>Course Objectives</u>	The objective of the course is to provide an insight into the components of the immune system, their development, their functions and their mechanisms of action and various Immunological techniques.	
<u>Course Outcomes</u>	<ol style="list-style-type: none"> 1. This course will enlighten the students on the importance of immune system in human body to fight pathogens. 2. Students will be able to understand mechanisms of Immunological response. 3. Students will develop an understanding of antigen-antibody interactions and various serological techniques for immunological research. 	
<u>Content</u>	<ol style="list-style-type: none"> 1. Cells and organs of the immune system 2. Innate immune response: Mechanical barriers to infection, Physiological factors contributing to innate immunity, Inflammatory response and Phagocytic system, Complement system. 3. Adaptive immune response: Cell-mediated and Humoral immunity- primary and secondary immune response, Major Histocompatibility Complex- Molecular organization of MHC molecules (H-2, HLA), Structure of MHC molecules. Class I MHC-peptide and Class II MHC-Peptide interactions. Antigen presenting cells (APCs), Antigen processing and presentation pathways. 4. Antigens and Antibodies: Antigens: Chemical complexity and molecular property of 	<p>5h</p> <p>5 h</p> <p>5h</p> <p>4h</p>

	<p>Antigens, Immunogens, Haptens, Epitopes.</p> <p>Antibodies: Structure and function of various, classes of immunoglobulins, Antigenic determinants on immunoglobulins, monoclonal and polyclonal antibodies and their production by hybridoma technology.</p> <p>5. Immunogenetics: Generation of antibody diversity, class switching among constant-region genes</p> <p>6. Immune effector mechanisms – Cytokines (properties, receptors and functions), Immunological tolerance, Hypersensitivity reactions and Autoimmunity.</p> <p>7. Immune system in health and disease: Immunodeficiencies, AIDS, Transplantation immunology, Concepts of vaccines.</p> <p>8. Immunotechniques:</p> <p>Antigen – antibody reactions: Principles and techniques- <i>in vitro</i> precipitation, agglutination, immunofluorescence, immunodiffusion, immunoprecipitation, immunoelectrophoresis, ELISA, RIA, Western blotting, Immunohistochemistry, flow cytometry.</p>	<p>2h</p> <p>5h</p> <p>4h</p> <p>6h</p>
Pedagogy:	Lectures (online or physical)/ tutorials/ laboratory work/ viva/ seminars/ term papers/assignments/ presentations/ self-study.	
Text Books/ References / Readings:	<ol style="list-style-type: none"> 1. J. Owen, J. Punt, S. Stranford. J. Patricia. Kuby Immunology, WH Freeman and Company, USA. 2012, 8th Edition. 2. S.J. Programme: M. Sc. (Biochemistry)

Course Code: BCO 111

Title of the Course: Biochemistry of environmental pollution and remediation [T]

Number of Credits: 3

Effective from AY: 2021-22

Prerequisites for the course:	It is assumed that the students have a basic knowledge of environment pollutants and biogeochemical cycles (water, O, C, N, S, P).	
Course Objectives:	This course develops concepts in Environmental Pollution (Impact on air, water and soil), role of microorganisms in biogeochemical cycles and bioremediation of pollutants	
Course Outcomes:	Learning of impact of various environmental pollutants on air, water and soil, role of microorganisms in biogeochemical cycles and bioremediation of pollutants and the biochemistry of remediation mechanisms for developing further abatement strategies	
Content:	<p>1. Environment and Pollutants: Environment and its component; Atmosphere, soil, aquatic – fresh water, marine systems; biogeochemical cycles. Pollutants: classification, toxicity, synergistic or antagonistic action. Eco-toxicology: concept of permissible limits, ED50 & LD50; acute and chronic exposures; biochemical effects and genotoxicity. Monitoring of pollution using indicator microorganisms, biosensors: genetically modified organisms and enzymes. Significance of dissolved oxygen, BOD, COD. Environment protection regulations, impact assessment and standards.</p> <p>2. Impact of environmental pollution: Atmosphere Greenhouse gases and CFCs – sources and effect on the ozone layer; consequences; concept of carbon credit. Atmospheric particulate matter and smog – effect on respiratory system Elements such as asbestos, lead – toxicity and occupational hazards. Soil Xenobiotics, agricultural chemicals, improper waste disposal Hydrocarbons: petroleum and polynuclear aromatics such as naphthalene, benzo-pyrene, solvents, pesticides, lead and other heavy metals –</p>	<p>14 h</p> <p>14 h</p>

	<p>significance on health. Aquatic/Marine – fresh water, marine systems. Discharge of industrial effluents such as mining, metals, pesticides, textiles, thermal waters, aquaculture, sewage; oil spills – impact on aquatic life and the food chain; consequences on human health</p> <p>3. Remediation of waste: Treatment of waste Concepts of Reuse, Recycle, Recovery. Introduction: Waste water/ sewage treatment, Solid waste management, Hospital waste management. Bioremediation: Concept and technologies. Biological systems – plants, bacteria and fungi; microbial consortia. Microbial processes – enzymic transformations, co-metabolism, microbial adhesion, biofilms, production of extracellular polymers and emulsifiers. Removal of metal pollutants through sedimentation, sorption, precipitation, speciation conversion</p> <p>Emerging eco-friendly alternatives for chemical industry – Green chemistry and Green Technology.</p>	8h
Pedagogy:	Lectures (online or physical)/ tutorials/laboratory work/ outreach activities/ project work/ viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Biochemistry)

Course Code: BCO 124

Title of the Course: Cell Biology [T]

Number of Credits: 3

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Should have basic knowledge on Prokaryotic and eukaryotic cells.	
<u>Course Objectives</u>	The objective is to offer detailed knowledge about cell biology, various cellular organelles and the cell communication pathways associated with the cellular processes of the cells. The course aims to provide insights of basic cell culture techniques.	
<u>Course Outcomes</u>	<ol style="list-style-type: none"> 1. Students will learn about cell structure, cell division and cell cycle mechanisms, various cellular organelles and their functions. 2. Students will acquire insight into the processes of transport across cell membranes, 3. Students will gain knowledge about the concepts of various cellular communication pathway and their importance. 4. This course will give them understanding of basic Cell culture techniques needed to work in a Biological research laboratory. 5. This course will provide the students with the base for various courses in life science including Cancer biology, Neurochemistry, etc. 	

<u>Content</u>	<ol style="list-style-type: none"> 1. Structural organizations, structure and functions of cellular and sub-cellular organelles: prokaryotic and eukaryotic cells, Animal and plant cells 2. Biological membrane structure and function: Structure and functions of membrane, Transport across cell membrane- Passive and active transport of molecules across biological molecules, membrane pumps. 3. Cell division and cell cycle: Mitosis and Meiosis, their regulation 4. Cellular communication and Cell signalling: Signal transduction pathway, Signalling molecules and their receptor- G-Protein Coupled Receptors, Receptor Tyrosine Kinases, MAP kinase pathway, JAK-STAT pathway; light signaling in plants, bacterial chemotaxis and quorum sensing Programmed cell death: Apoptosis 5. Plant tissue culture: techniques and applications- Introduction to plant tissue culture and various requirements, preparation steps for tissue culture, surface sterilization of plant tissue material, basic procedure for aseptic tissue transfer, tissue culture methodologies; incubation and maintenance of culture; Applications of PTC. 6. Animal tissue culture: techniques and applications- Introduction to animal tissue culture and various requirements, Stem cells, typical cell lines, Growing mammalian cells and general maintenance of cells; Application of ATC. 7. Microbial culture techniques: <i>In vitro</i> culture techniques, nutrient requirements. 	<p>6h</p> <p>4h</p> <p>4h</p> <p>10h</p> <p>4h</p> <p>4h</p> <p>4h</p>

Programme: M. Sc. (Biochemistry)

Course Code: BCO 125

Title of the Course: Analytical Biochemistry-II

Number of Credits: 3

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Students should have studied the theory/ instrumentation and application of some of the basic bio-analytical techniques. It is assumed that students have a basic knowledge of fundamentals in biochemistry and certain basic techniques in routine laboratory analysis.	
<u>Course Objectives:</u>	<ol style="list-style-type: none"> 1. Introduction of various bioanalytical techniques for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool. 3. Develop concepts in techniques and instruments required for macromolecule structure determination and other techniques such as tracers for metabolic pathways. 	
<u>Course Outcomes:</u>	<ol style="list-style-type: none"> 1. Students should be able to differentiate between various analytical techniques based on their theory and sensitivity achieved. 	

	<p>2. Students should be in a position to explain the principles of various techniques and apply the knowledge of the techniques for designing various experiments in research and development.</p> <p>3. Students should be able to choose between various techniques of structure elucidation based on the information desired and interpret the data obtained to a fair level.</p>	
<u>Content:</u>	<p>1. Optical methods of analysis: Theory and application of UV-visible spectrophotometry, fluorimetry, atomic absorption spectrophotometry (AAS). 4 h</p> <p>2. Microscopy: Basic aspects of compound microscope, theory and applications of Light, Dark, Phase-contrast, and Inverted. 4 h</p> <p>3. Bioimaging and image processing: Principle, application and profile analysis: fluorescence microscopy, epifluorescence, immuno-fluorescence microscopy, and confocal scanning microscopy. Theory, instrumentation and applications of atomic force microscopy (AFM), scanning electron microscopy (SEM), transmission electron microscopy (TEM). Optical tweezers, photography, digital imaging and image processing, 7 h</p> <p>4. Radioisotopes: Nature of radioactivity and its detection, measurement of radioactivity, Disintegration kinetics, Radioactivity counters – GM Counter, Scintillation Counter, Isotope dilution analysis, Autoradiography, radiorespirometry, Tracer techniques for metabolic pathways. Safety measures in handling radioisotopes. 7 h</p> <p>5. Spectroscopic techniques for macromolecule structure determination: Principles, application and profile analysis of FTIR, NMR, X-ray diffraction, optical rotatory dispersion, circular dichroism. 8 h</p> <p>6. Mass Spectrometry: Principle, components, working and applications of mass spectrometer, different types of ionization methods used in mass spectrometer (CI, EI, ESI, FAB), different types of mass analysers used in mass spectrometer (magnetic sector, quadrapole), MALDI-MS, MALDI-TOF-MS, ICP-MS, 6 h</p>	

	introduction to GCMS, LCMS.	
Pedagogy:	Lectures (online or physical)/ tutorials/ laboratory work/ outreach activities/ project work/ vocational training/ seminars/ term papers/ assignments/ presentations/ self-study etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Biochemistry)

Course Code: BCO 126

Title of the Course: Laboratory techniques and Applications of Biochemistry

Number of Credits: 4

Effective from AY: 2021-22

<u>Prerequisites for the course:</u>	Should have basic knowledge on various Analytical techniques, Cell biology, Immunotechniques and Biochemistry of environmental pollution and remediation.	
<u>Course Objectives</u>	The objective of this practical course is to provide hands-on-experience in Cell biology, Immunotechniques, Analytical	

	techniques and analysing environmental samples and pollution.	
<u>Course Outcomes</u>	<ol style="list-style-type: none"> 1. The Cell biology part of the practical will give them understanding and hands-on training of basic Cell culture techniques needed to work in a Biological research laboratory. 2. Immunology and Immunotechniques unit of this practical will train the students with skillful handling of various techniques in Immunological research. 3. Analytical Biochemistry-II part of this practical will explain the principle and working of basic instruments in analytical laboratory that will train the students in handling various instruments in Analysis. 4. Biochemistry of environmental pollution part of this practical will train the students about analysis of environmentally significant water quality parameters and predicting the environmental quality based on observed data. 	
<u>Content</u>		
	I. Cell Biology <ol style="list-style-type: none"> 1. Microbial culture techniques: Isolation, identification and characterization and maintenance of bacterial and fungal cells; Cell counting and viability (fungal/bacterial cells). 2. Animal cell culture techniques: Isolation, culturing and maintenance of cell lines, Microscopic examination, Cell counting, cytotoxicity and viability testing. 3. Plant tissue culture techniques: Surface sterilization of plant material, excision, Aseptic tissue transfer, callus culture and micropropagation. 	24 h
	II. Immunology and Immunotechniques <ol style="list-style-type: none"> 1. Agglutination assays: <ol style="list-style-type: none"> A) Determination of ABO and Rh blood group, B) Latex bead agglutination C) Widal test 2. Immunodiffusion assays: 	24 h

	<p>A) Single Immunodiffusion</p> <p>B) Double Immunodiffusion</p> <p>3. VDRL test</p> <p>4. Rapid tests:</p> <p>A) Malarial antigens Pv/Pf</p> <p>B) Dengue IgM and IgG antibodies</p> <p>C) Hepatitis HBsAg</p> <p>5. ELISA</p> <p>6. Immunoelectrophoresis</p> <p>7. Determination of Immunoglobulins.</p> <p>A) Precipitation of antibodies with $(\text{NH}_4)_2\text{SO}_4$</p> <p>B) Determination of antibody concentration.</p> <p>C) Separation and visualization of immunoglobulins by SDS-PAGE.</p>	
	<p>III. Analytical Biochemistry – II</p> <p>1. Visualization of cells by Light and Phase contrast microscopy.</p> <p>2. UV-Visible spectroscopic studies to demonstrate Beer-Lambert Law, extinction coefficient determination and quantitative analysis.</p> <p>3. Measurement of fluorescence using Spectrofluorimeter.</p> <p>4. Demonstration of: GC, IR, NMR, and Mass/MALDI-TOF</p> <p>5. Elucidation of structure of cellular metabolites using IR, NMR and Mass profiles.</p>	24h
	<p>IV. Biochemistry of environmental pollution and remediation</p> <p>1. Estimation of Dissolved oxygen (DO) and Biochemical Oxygen Demands (BOD) of given water sample using Winkler method.</p> <p>2. Estimation of Chemical Oxygen Demands (COD) of water sample and assessment of water quality using observed BOD and COD values.</p> <p>3. Detection of sewage pollution by screening for indicator organisms such as <i>E. coli</i>.</p>	24 h

	4. Biotransformation of xenobiotics.	
Pedagogy:	Lectures/ tutorials/ laboratory work/ field work/ project work/ viva/ seminars/ assignments/ term papers.	
Text Books/ References / Readings:	<ol style="list-style-type: none"> 1. Bhatia, S., Naved, T., Sardana, S. Animal tissue culture facilities. IOP publishing ltd., 2019. 2. Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the spectroscopic techniques such as UV-Vis, IR at FY B Sc, S Y B Sc or T Y B Sc levels so as to have basic knowledge of spectroscopy and basic principles.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction of various concepts in molecular and atomic spectroscopy. 2. Learning data analysis, handling and interpretation of spectra 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to use spectroscopic methods for qualitative and quantitative analysis. 2. Evaluate the utility of UV/Vis spectroscopy as a qualitative and quantitative method. 3. Identification of functional group based on IR spectra 4. Students should be in a position to predict the structure based on IR, NMR, MS data. 	
Content:	<p>1.Introduction to spectrochemical methods</p> <p>1.1. Interaction of Electromagnetic Radiation with Matter: electromagnetic spectra, Regions of Spectrum; Numericals.</p> <p>1.2 Electronic spectra and Molecular structure: kinds of transition, Chromophores and auxochrome; absorption by isolated chromophores, conjugated chromophores, aromatic compounds, inorganic chelates.</p> <p>1.3. Infrared absorption and molecular structures: IR spectra, overtones and bands-basis of NIR absorption</p> <p>1.4. Spectral Databases: Identification of unknown; Application of UV-Vis and IR spectroscopy for identification of unknown compounds</p> <p>1.5. Solvents for spectrometry: Choices and effect of solvents on UV-Vis and IR spectra.</p> <p>1.6. Quantitative Calculations: The Lambert-Beer's Law; Mixtures of absorbing species-laws of additivity of absorbance; calibration curve for calculation of unknown; Spectrometric errors in measurement; Deviation from Lambert-Beer's law-chemical deviation, instrumental deviation; Quantitative measurement from IR spectra; Numericals for quantitative analysis using UV-VIS spectroscopy.</p> <p>1.7. Spectrometric Instrumentation of UV-Vis and IR (brief introduction only): Sources, monochromators, sample cells, Types of instruments; detectors; Instrumental wavelength and absorption calibration. (Chapter 16: Analytical Chemistry, G.D. Christian, 6thEd.)</p> <p>2. Molecular Luminescence: Fluorimetry, Phosphorimetry and Raman Spectroscopy</p> <p>2.1. Introduction,</p> <p>2.2. Fluorimetry : Theory and basic principle; Quenching; Spectrofluorimeters and applications</p> <p>2.3. Phosphorimetry: Theory and basic principle; phosphorimeters and application</p> <p>2.4. Raman Spectroscopy: Theory and Structural analysis using Raman Spectra (Chapter 6: Instrumental Methods of Chemical Analysis, G.W. Ewing, 5thEd)</p> <p>3. Atomic Spectroscopy</p> <p>3.1. Principles of emission</p> <p>3.2. Atomic Emission spectroscopy (AES)</p> <p>3.3. Flame Emission spectroscopy (FES)</p>	<p>12 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>3.4. Atomic absorption Spectroscopy (AAS) 3.5. X-Ray Fluorescence Spectroscopy (XRF) (Introduction, principles and applications of above techniques shall be discussed; Chapter 13: Analytical Chemistry Principles, J.H. Kennedy, 2nded)</p> <p>4. Spectrometric Identification of Organic compounds 4.1 Ultraviolet and visible Spectroscopy : Brief Revision of UV/VIS Spectroscopy ;Instrumentation and Sampling ; Applications of Electronic Spectroscopy: Conjugated Dienes, Trienes, polyenes, α, β unsaturated carbonyl compounds, aromatic hydrocarbons (Assignment based on BSc. Syllabus for calculating λ_{max}) (Kemp – Chap4) 4.2 Infrared Spectroscopy: Introduction to IR spectroscopy; Basic IR spectra interpretation; Frequencies of functional group. (Kemp – Chap2). 4.3 Proton and Carbon NMR Spectroscopy: Theory of NMR ; Chemical shift; factors influencing chemical shift ; Solvents used in NMR; Theory of spin-spin splitting and simple spin systems; Coupling constant calculation; Factors influencing coupling constant (Assignment based on BSc. Syllabus) (Kemp - Chapter 3) 4.4 Mass Spectrometry : Basic Principles and Instrumentation: Problem solving in structure elucidation based on MS (Kemp - Chapter 5) 4.5. Conjoint Spectrometry Problems: Structural elucidation of organic molecules using UV, IR, NMR (1H, ^{13}C), MS, (Silverstein)</p> <p>(Note: Assignment based on BSc. syllabus for all above spectrometric structure should be given to student. <i>More weightage of lectures shall be given for solving IR and NMR data for structure elucidation</i>)</p>	14 hr
Pedagogy:	Mainly lectures and tutorials. Seminars / term papers / assignments / presentations / self-study or a combination of some of these can also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACC-402

Title of the Course: Laboratory Course in Analytical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied practical chemistry courses at F.Y B.Sc, S.Y. B .Sc & T Y B Sc levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	Introduction of various experimental techniques for analysis. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	Students should be in a position to use standardized material to determine an unknown concentration. To gain experience with some statistics to analyse data in laboratory Students should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p><i>This course consists of 6 units of experiments in various areas of Analytical chemistry. Minimum 12 experiments shall be carried out and at least 02 experiment from each unit shall be conducted.</i></p> <p>UNIT 1: STATISTICS 1.Calibration of apparatus (balance, volumetric flasks, pipettes and burettes) and preparation of standard solutions and standardisation</p> <p>UNIT 2: COLORIMETRY AND UV-VISIBLE SPECTROPHOTOMETRY 2.Estimation of Iron from Pharmaceutical sample (capsule) by thiocyanate method 3. Estimation of lead/nitrate in water sample 4. Estimation of KNO₃ by UV spectroscopy and K₂Cr₂O₇ by Visible spectroscopy 5. Simultaneous determination and Verification of law of additivity of absorbances (K₂Cr₂O₇ and KMnO₄) 6.Estimation of phosphoric acid in cola drinks by molybdenum blue method</p> <p>UNIT 3: FLAME SPECTROPHOTOMETRY 7.Estimation of Na 8.Estimation of K or Ca</p> <p>UNIT 4: VOLUMETRY 9.Estimation of Ca in pharmaceutical tablet. 10.Estimation of Al and/or Mg in antacid tablet</p> <p>UNIT 5: ION EXCHANGE CHROMATOGRAPHY & SOLVENT EXTRACT ION 11.Separation and Estimation of Zn and Cd 12.Separation and Estimation of chloride and bromide 13.Extraction of Cu as copper dithiocarbamate (DTC) using solvent extraction and estimation by spectrophotometry</p>	

	UNIT 6: INTERPRETATION EXERCISES 14. Thermal studies: TGDTA and Isothermal weight loss studies of various hydrated solids like $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{Ca}_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$, $\text{Fe}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ 15. X-ray powder diffractometry: Calculation of lattice parameters from X-ray powder pattern of cubic system such as NiMn_2O_4 , CoFe_2O_4 etc.	
Pedagogy:	Prelab exercises / assignments / presentations / lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACO-401

Title of the Course: Analytical Techniques

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different analytical techniques used for qualitative, quantitative estimation	
Course Outcomes:	3. Students should be in a position to understand principle behind different analytical techniques 4. With the knowledge basic techniques used for qualitative and quantitative estimation students should be in a position to choose for appropriate technique for particular analysis 5. Students should be in a position to select the separation techniques for purification of analytes.	
Content:	<p style="text-align: center;">Section A</p> <p>1 Analytical Objectives, Data Handling and Good Laboratory Practice (GLP) Scope of analytical science and its literature, qualitative and quantitative analysis, ways to express accuracy and precision, types of errors and their causes; significant figures, control charts, confidence limit, test of significance, rejection of a result- the Q-test. Introduction to significant analytical procedure such as GLP- standard operating procedures, quality assurance, quality control and analytical method validation.</p> <p>2 Sampling and Calibration Methods Sampling and sample preparation, general steps in chemical analysis, calibration of glass wares. Finding the best straight line-least square regression, correlation coefficient; Calibration curves, standard addition technique and internal standards. Chemical concentrations.</p> <p>3 Electroanalytical techniques Introduction to electroanalytical techniques, electrochemical cells, electrode potentials, voltammetry and polarography, cyclic voltammetry, coulometry, controlled potential coulometry and coulometric titrations, Stripping voltammetry, ion-selective electrodes and sensors; Evaluation and Calculation; Application to Inorganic and Organic Trace analysis</p> <p style="text-align: center;">Section B</p> <p>1. Extraction Techniques Liquid-liquid extraction/solvent extraction: partition coefficient, distribution ratio and percent extraction; choice of solvents; Solvent extraction of metal ions-ion association complexes and metal chelates; multiple batch extraction, Craig's counter-current distribution; Introduction to green analytical extraction methods: Supercritical Fluid Extraction (SFE); Pressurized Liquid Extraction (PLE); Ultrasound Assisted Extraction (UAE); Microwave Assisted Extraction (MAE);</p>	<p>7 hr</p> <p>5 hr</p> <p>6 hr</p> <p>4 hr</p>

	<p>Enzyme Assisted Extraction (EAE); Solid Phase Microextraction (SPME); Solid Phase Extraction (SPE)</p> <p>2. Basic Principles in Chromatographic Methods Principles of chromatography, classification of chromatographic techniques based on mechanism of retention, configuration, mobile and stationary phase. Efficiency of separation- plate theory (theoretical plate concept) and rate theory (Van Deemter equation). Principles and applications of Paper chromatography, thin layer chromatography, HPTLC, Size exclusion and Ion exchange chromatography. Counter-current chromatography for isolation of natural products.</p> <p>3. Gas and Liquid Chromatography Introduction; Instrumental Modules; The Separation System; Choice of Conditions of Analysis; Sample Inlet Systems; Detectors; Practical Considerations in Qualitative and Quantitative Analysis; Coupled Systems-introduction to GCMS, LCMS; Applicability-interpretation and numerical problems; Recent and Future Developments</p> <p>4. Radioanalytical techniques Theory and principles of radio analytical technique, detection of nuclear radiation, radiation detectors, pulse height analysis, counting error, analytical application of radioisotopes, neutron activation analysis and isotope dilution analysis.</p>	<p>4 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / presentations/ self-study or a combination of some of these can also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Title of the Course: General Inorganic Chemistry

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in Chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.BSc. levels so as to have basic knowledge of Inorganic Chemistry and basic principles.	No. of lectures
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce atomic / molecular structure and symmetry. 2. To provide fundamental knowledge of solid state chemistry. 3. To introduce basic aspects of coordination / organometallic / bioinorganic chemistry. 4. To provide the concepts of acids and bases. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand atomic and molecular structure and the importance of symmetry. 2. Students should be able to understand molecular shapes. 3. Students should be in a position to understand concepts in i) solid state chemistry, ii) coordination chemistry, iii) organometallic chemistry, iv) bioinorganic chemistry. 	
Content:	<p>1. Atomic structure, molecular structure and bonding</p> <p>1.1 Atomic Structure: Structures of hydrogenic atoms: some principles of quantum mechanics. Many electron atoms: penetration & shielding, building up principle, classification of elements. spectroscopic terms. Atomic/ionic radii, ionization energy, electron affinity, electronegativity, polarizability.</p> <p>1.2 Molecular Structure & bonding: Lewis structures, VSEPR model, the basic shapes. Valence bond theory: the hydrogen molecule, homonuclear diatomic & polyatomic molecules; hybridisation. molecular orbital theory: approximation, bonding & antibonding orbitals. Homonuclear diatomic & Heteronuclear diatomic molecules.</p> <p>2. Molecular Symmetry:</p> <p>2.1 Symmetry elements</p> <p>2.2 Symmetry operations, equivalent symmetry elements and equivalent atoms, symmetry point groups with examples, point groups of higher symmetry, systematic procedure for symmetry classification of molecules and illustrative examples,</p> <p>2.3 Dipole moment, optical activity and point groups.</p> <p>3. Solid state chemistry</p> <p>3.1 Structures of solids: crystal structures, lattices & unit cells, close packing of spheres, holes in closed-packed structures.</p> <p>3.2 Structures of metals & alloys: polytypism, nonclosed-packed structures, polymorphism of metals, atomic radii of metals, alloys, substitutional solid solutions, interstitial solid solutions of non-metals, intermetallic compounds.</p> <p>3.3 Ionic solids: Basic characteristic structures of ionic solids, the rationalization of structures, ionic radii, radius ratio, structure maps, the energetics of ionic bonding, lattice energy.</p>	<p>9 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>4. Coordination Chemistry</p> <p>4.1 Introduction, representative ligands, nomenclature,</p> <p>4.2 Constitution & geometry, low coordination numbers, intermediate coordination numbers, higher coordination numbers, polymetallic compounds.</p> <p>4.3 Isomerism & chirality in square planar & octahedral complexes, ligand chirality.</p> <p>4.4 Thermodynamics of complex formation: formation constants, chelate & macrocyclic effects, steric effects & electron delocalization.</p> <p>4.5 Electronic properties of metal complexes: CFT applied to octahedral and tetrahedral complexes, magnetic moments/CFSE. Electronic spectroscopy: basic concepts, interpretation of spectra of d^1 & d^2 ions (Orgel diagram for octahedral and tetrahedral complexes).</p> <p>5. Organometallic Chemistry</p> <p>5.1 Introduction to organometallic chemistry, nomenclature, stability and inert gas rules (neutral atom and donor pair electron count methods).</p> <p>5.2 Ligands CO & phosphines, homoleptic carbonyls/synthesis/properties/ oxidation-reduction of carbonyls/ basicity/reactions of CO/spectroscopic properties of metal carbonyls.</p> <p>5.3 Oxidative addition and reductive elimination.</p> <p>6. Basic Bioinorganic Chemistry</p> <p>6.1 Macronutrients/micronutrients. Role of elements in biology. Metal ion transport role.</p> <p>6.2 Definition of metallobiomolecules / metalloporphyrins, structure of porphine and heme group, examples of metalloenzymes of copper and zinc.</p> <p>7. Acids and Bases</p> <p>7.1 Brönsted Acidity, proton transfer equilibria in water, solvent levelling, solvent system definition if acids & bases, characteristics of Brönsted acids,</p> <p>7.2 Periodic trends in aqua acid strengths, non-aqueous solvents, Lewis acidity, hard & soft acids and bases, solvents as acids & bases, superacids & superbases.</p>	<p>5 hr</p> <p>4 hr</p> <p>3 hr</p> <p>5 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

---	---	--

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels so as to have basic knowledge of experimental chemistry.	No. of lectures
Course Objectives:	Students shall be trained in the preparation of coordination compounds / double salts, understanding of redox chemistry, determination of metal content and degree of hydration, and determination of the formula of synthesized compounds. Students will be given hands-on experience in using colorimeter / UV-Vis spectrophotometer while performing instrumental analysis.	
Course Outcomes:	1. Students should be in a position to: i) set up and perform inorganic synthesis ii) isolate and purify crystalline product. iii) develop skills for compound characterization iv) determine the metal content by titrimetry / gravimetry /colorimetry.	
Content:	<p>Synthesis of inorganic compounds (any six)</p> <ol style="list-style-type: none"> 1. $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ 2. $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ 3. $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]\text{Cl}_3$ 4. $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 5. $\text{K}_3[\text{Cr}(\text{SCN})_6] \cdot 4\text{H}_2\text{O}$ 6. $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 7. $[\text{Cr}(\text{OAc})_2]_2 \cdot 2\text{H}_2\text{O}$ 8. Potash alum from scrap aluminium 9. Zinc iodide (Redox synthesis) <p>Quantitative estimations/determinations (any six)</p> <ol style="list-style-type: none"> 1. Estimation of Ni in $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ titrimetry/gravimetry 2. Estimation of Co in $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ volumetrically 3. Estimation of oxalate in $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ or $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ 4. Estimation of nitrite by redox titration 5. Estimation of calcium in calcite ore 6. Estimation of copper in gun metal alloy or Devarda's alloy iodometrically 7. Estimation of Cr in chrome alum and $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ to determine degree of hydration. 8. Colorimetric determination of Cr or Ni 	<p>24 hr</p> <p>24 hr</p>
Pedagogy:	Students should be given suitable pre-lab and post-lab assignments and explanation revising the theoretical aspects of laboratory experiments prior to the conduct of each experiment. Each experiment should preferably be done individually by the students.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ICO-401

Title of the Course: Topics in Inorganic Chemistry & Environmental Chemistry

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Student should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels and / or CHIC-401 course so as to have basic knowledge of Inorganic / environmental chemistry.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To provide fundamental aspects of transition & inner transition metals & their compounds.2. To provide knowledge of main group elements of the periodic table & their compounds3. To introduce various global phenomenon's of atmosphere & environment, follow directive of the Supreme Court in 1993 to introduced environmental education at all levels, have a fair knowledge on the various global activities to justify permissible or adverse, so that future generation are not adversely affected.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in position to understand fundamentals / usefulness of transition & inner transition metals.2. Students should be in position to understand chemistry main group elements.3. Students shall be aware of the maintenance of healthy living atmosphere on the globe.	
Content:	<p style="text-align: center;">SECTION-I</p> <p>1. Chemistry of transition & inner transition elements</p> <p>1.1 Transition elements: IUPAC definition of transition elements, occurrence, physical & chemical properties, noble character, metal oxides & oxido complexes, examples of metal-metal bonded clusters.</p> <p>1.2 Inner transition elements: Lanthanides, occurrence, properties, oxidation states, electronic structure, colour and spectra, magnetic properties, lanthanide contraction, compounds of lanthanides. Actinoid chemistry, general trends.</p> <p>2. Main group elements and their compounds</p> <p>2.1 Boron group: Compounds of boron:- borazine and boron nitride, synthesis, properties, structure & bonding. Borates: classification, structures & examples.</p> <p>2.2 Carbon group: Allotropes of carbon including C₆₀, intercalation compounds of graphite, carbides. Compounds of silicon: silicates, zeolites & silicones.</p> <p>2.3 Nitrogen group:- Introduction: oxides & oxyacids of nitrogen. 2.4 Oxygen group: oxyacids & oxohalides of S, S₄N₄ ring compounds: synthesis, properties, structure & bonding.</p>	<p>9 hr</p> <p>9 hr</p>

	<p style="text-align: center;">SECTION-II</p> <p>1. Atmosphere Structure and properties of the atmosphere, composition of atmosphere and vertical temperature behaviour, lapse rate and temperature inversion.</p> <p>2. Air Pollution Classification of air pollutants and photochemical reactions in the atmosphere Common air pollutants (e.g. CO, NO_x, SO₂, hydrocarbons and particulates) (a) sources (b) physiological and environmental effect (c) monitoring, d) various remedial & technological measures to curb pollution. Air quality standards.</p> <p>3. Water pollution Importance of buffer & buffer index in waste water treatments. Chemical, physical & biological characteristics of water pollution, specific & non-specific characterization of water. DO, BOD, COD, and chlorine demand, typical water treatment & waste water treatment (Municipal).</p> <p>4. Treatment of Industrial wastes Electroplating industry, fertilizer industry and pharmaceuticals industries.</p> <p>5. Biogeochemical cycles: Carbon and Nitrogen cycles nature</p>	<p>2 hr</p> <p>7 hr</p> <p>5 hr</p> <p>2 hr</p> <p>2 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCC-401

Title of the Course: Structure, reactivity, stereochemistry and reaction mechanism

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	3. Introduction of various concepts based on molecular orbital theory. 4. Introduction of topicity, prostereoisomerism and chemo-, regio- and stereoselectivity in organic reactions. 5. Learning mechanistic aspects of various type of reactions in organic synthesis.	
Course Outcomes:	5. Students should be in a position to evaluate effect of delocalization of electrons & presence or absence of aromaticity in organic compounds. 6. Students should be in a position to apply various concepts in stereochemistry to understand stereochemical output in a reaction. 7. Students shall be in a position to understand/propose plausible mechanism of organic reactions.	
Content:	1. Molecular orbitals and delocalized chemical bonding: Qualitative description of Molecular orbitals of simple acyclic and monocyclic Systems, Frontier molecular orbitals, Conjugation, cross conjugation, resonance, hyperconjugation and tautomerism (types and examples), Aromaticity: Origin of Huckel's rule, examples of aromatic, non-aromatic and antiaromatic compounds; concept of Mobius aromaticity. 2. Structure & Reactivity: Acidity, basicity and pKa of organic compounds; Acid and base strengths; HSAB concept & Factors affecting it, Effect of structure & medium on acid and base strength, Concept of superacids and superbases, Electrophilicity & Nucleophilicity, Examples of ambident nucleophiles & electrophiles. (Including revision of aromatic electrophilic and nucleophilic substitution) 3. Stereochemistry: Brief revision of configurational nomenclature: R & S; D & L; E & Z; cis & trans and <i>syn</i> & <i>anti</i> nomenclature. Chirality in molecules with two and more chiral centres. Conformational analysis of open chain compounds (Butane, 2, 3-butane diol, 2,3-dibromobutane etc.). <i>Erythro</i> and <i>threo</i> nomenclature. Topicity and Prostereoisomerism: Topicity of ligands and faces-homotopic, enantiotopic and Cram's rule / diastereotopic ligands and faces. Introduction to chemoselective, regioselective and stereoselective reactions. Stereochemistry of <i>cis</i> - and <i>trans</i> -decalins, conformation and reactivity of cyclohexane and substituted cyclohexanes, cyclohexene / cyclohexanone. 4. Reaction Mechanism: Brief revision of carbocations, carbanions, free radicals, carbenes and nitrenes with reference to generation, structure, stability and reactivity; Types of mechanisms, types of reactions, thermodynamic and kinetic control. The Hammond postulate and principle of microscopic reversibility, Methods of determining reaction mechanisms like- 1) Identification of products,	06 hr 06 hr 08 hr 06 hr

	<p>2) Determination of the presence of intermediates (isolation, detection, trapping and addition of suspected intermediate, 3) Isotopic labelling, 4) Stereochemical evidence, 5) Kinetic evidence and 6) Isotope effect (at least two reactions to exemplify each method be studied)</p> <p>5. Aliphatic Nucleophilic substitution: Brief revision of nucleophilic substitutions with respect to Mechanism, Various factors affecting such reactions; The Neighbouring Group Participation (NGP)/ Anchimeric assistance: General approach to various NGP processes; NGP by unshared/lone pair of electrons; NGP by π-electrons; NGP by aromatic rings (formation of phenonium ion intermediate); NGP by sigma bonds with special reference to bornyl and nor-bornyl system (formation of non-classical carbocation)</p> <p>6. Elimination reactions: The E2, E1 and E1cB mechanisms. Orientation of the double bond, Saytzeff and Hofmann rule. Effects of changes in the substrate, base, leaving group and medium on 1) overall reactivity, 2) E1 vs. E2 vs. E1cB and 3) elimination vs substitution, Mechanism and orientation in pyrolytic <i>syn</i> elimination (various examples involving cyclic and acyclic substrates to be studied).</p>	<p>06 hr</p> <p>04 hr</p>
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCO-401

Title of the Course: Synthetic Organic Chemistry I

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels as well as the course CHOC-401 so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	1. Introduction to concepts of functional groups and their interconversion 2. Learning mechanistic concepts of carbon-carbon bond making by nucleophilic addition to carbonyl group 3. Learning mechanistic aspects of various oxidation & reduction processes used in organic syntheses.	
Course Outcomes:	1. Students should be in a position to choose appropriate oxidizing agent for oxidation of a particular functional group. 2. Students should be in a position to choose appropriate reducing agent for reduction of a particular functional group. 3. Students shall be in a position to understand/propose plausible mechanism of organic reactions. 4. Student should be able to choose appropriate nucleophilic addition reaction for making carbon-carbon bond.	
Content:	<p>1. Oxidation reactions: Oxidation of organic compounds using chromium (PCC, PDC) and manganese compounds, Oppenauer oxidation, Swern oxidation, ozonolysis. Other methods of oxidation such as selenium dioxide, Pb(OAc)₄, HIO₄, peracids, peroxides, OsO₄, RuO₄, DMSO (Swern) sodium bromate / CAN & NaOCl, DDQ, Prevost's reagent and Woodward Conditions; Catalytic oxidation over Pt, Photosensitised oxidation of alkenes, oxidation with molecular oxygen, aromatization, silver based reagents.</p> <p>2.Reduction reactions: Reduction of organic compounds using hydride-transfer reagents and related reactions : MPV reduction, NaBH₄, Trialkylborohydrides, LAH & lithium hydridoalkoxyaluminates, mixed LAH-AlCl₃ reagents, DIBAL and reduction with borane and dialkylboranes, Enzymatic reduction involving liver alcohol dehydrogenase/NADH & Bakers' yeast, catalytic hydrogenation, Dissolving metal reductions including acyloin condensation, Clemmensen reduction and Birch reduction, Other methods of reduction: Wolff-Kishner, Raney Ni desulphurisation, di-imide.</p> <p>3.Halogenation: Formation of Carbon Halogen bonds: Substitution in saturated compounds, alcohols, carbonyl compounds, substitution at allylic and benzylic compounds, bromodecarboxylation (Hunsdiecker reaction), Finkelstein reaction, iodolactonisation.</p>	<p>11 hrs</p> <p>9 hrs</p> <p>5 hrs</p>

	4. Esterification, amide preparation and hydrolysis: (study of different mechanisms and reagents)	6 hrs
	5. Name reactions: Knoevenegel Reaction, Claisen, Darzen, Stobbe, Perkin, Aldol, Benzoin, Pechmann condensation.	5 hrs
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in chemistry at F.Y B.Sc, S.Y B.Sc & T.Y B.Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	6. Introduction of various concepts on thermodynamics. 7. Introduction of electro chemistry and kinetics. 8. Learning quantum chemistry.	
Course Outcomes:	8. Students should be in a position to understand various concepts in physical chemistry. 9. Students should be in a position to apply these concepts during the lab course in physical chemistry. 10. Students shall be in a position to answer the NET/SET examination questions based on these topics.	
Content:	<p>1.Thermodynamics</p> <p>1.1 Thermodynamic properties: Gas laws, Real gasses, Boyle temperature, Critical temperature, State and path properties. Intensive and extensive properties. Exact and inexact differentials. Internal energy, enthalpy, entropy, free energy and their relations and significances. Maxwell relations. Thermodynamic equations of state.</p> <p>1.2 Joule-Thomson effect. Joule-Thomson coefficient for van der Waals' gas. Joule-Thomson effect and production of low temperature, adiabatic demagnetization, Joule-Thompson coefficient, inversion temperature.</p> <p>1.3 The third law of thermodynamics. Need for the third law. Apparent exceptions to third law. Application of third law. Use of thermodynamic functions in predicting direction of chemical change. Entropy and third law of thermodynamics.</p> <p>1.4 Phase equilibria: Phase rule, Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.</p> <p>1.5 Three component systems: Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. The role of added salts.</p> <p>2.Electrochemistry</p> <p>2.1 EMF series, decomposition potential and overvoltage, electronegativity, basic principles, completeness of deposition, Separation with controlled potentials, constant current electrolysis, composition of electrolyte, potential buffers, physical characteristics of metal deposits.</p> <p>2.2 Electroplating and electroless plating, electrosynthesis.</p> <p>2.3 Concepts of acid-base aqueous and non-aqueous solvents, hard and soft acid-base concept and applications.</p>	<p>10 hrs</p> <p>06 hrs</p>

	<p>3. Chemical Kinetics</p> <p>3.1 General introduction to various types of order of reaction including fractional order, Molecularity of the reaction.</p> <p>3.2 Introduction to reversible and irreversible reactions and reactions leading to equilibrium. Van'tHoffs equation and analysis of Gibbs free energy of equilibrium reactions.</p> <p>3.3 Collision Theory and Maxwell Boltzmann distribution of energies of colliding molecules(derivationnotrequired). The concept of collisional cross section and reactive cross section and its significance.</p> <p>3.4 Comparative study of transition state and collision state theory (derivation not required).</p> <p>3.5 Free radical reactions, Complex reactions such as acetaldehyde decomposition and reaction between H_2 and Br_2, Homogeneous reactions and acid-base catalysis.</p> <p>3.6 Elementary enzyme reactions.</p> <p>4. Quantum Chemistry</p> <p>4.1 Operators, Functions, Eigen value equations, Postulates.</p> <p>4.2 Schrodinger equation, application to simple system viz. free particle, particle in one dimensional, two dimensional and three dimensional box (quantization, separation of variables, degenerate wave functions).</p> <p>4.3 Hydrogen like atoms, Schrodinger equation and its solutions, atomic orbital wave functions and interpretation.</p> <p>4.4 Hückel MO theory, Secular equations, Secular determinant, delocalization energy, charge density, π-bond order, free valence, applications to C_2H_4, C_3H_5(radical), C_4H_6, C_4H_4, C_6H_6, C_6H_8</p>	<p>07 hrs</p> <p>13 hrs</p>
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers /assignments / presentations / self-study or a combination of some of these may be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: PCC-402 Title of the Course: Laboratory Course in Physical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Chemistry at F Y B Sc, S Y B Sc & T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various concepts on thermodynamics. 2. Introduction of electro chemistry and kinetics.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry by conducting experiments. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	1. To study the kinetics of hydrolysis of ethyl acetate and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 2. To study the kinetics of the reaction between Potassium persulphate (K ₂ S ₂ O ₈), and Potassium iodide (KI), and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 3. To determine the order of reaction between potassium persulphate and potassium iodide by graphical, fractional change and differential methods. 4. To determine the degree of hydrolysis of salt of weak base and strong acid using conductometer. 5. To determine the composition of a mixture of acetic acid, dichloroacetic acid and hydrochloric acid by conductometric titration. 6. To determine the dissociation constants of a dibasic acid and obtain derivative plot to get equivalence point. 7. To determine the dissociation constants of a tribasic acid (Phosphoric acid) obtain derivative plot to get equivalence point. 8. To determine formal redox potential of Fe ²⁺ /Fe ³⁺ and Ce ³⁺ /Ce ⁴⁺ system obtain derivative plot to get equivalence point. 9. To study the three component system such as toluene, ethanol and water. 10. To study the three component system such as acetic acid, chloroform; and water and obtain tie line. 11. To determine the molecular weight of polyvinyl alcohol by viscosity measurement. 12. To determine the molecular weight of polystyrene by viscosity measurement.	48 hrs
Pedagogy:	Lectures / tutorials / seminars / term papers / assignments / presentations / self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.	
References/ Readings	1. A. Finlay & J.A. Kitchener, " <i>Practical Physical Chemistry</i> ", Longman 2. F. Daniels & J.H. Mathews, " <i>Experimental Physical Chemistry</i> ", Longman. 3. A.M. James, " <i>Practical Physical Chemistry</i> ", 4. D.P. Shoemaker & C.W. Garland, " <i>Experimental Physical Chemistry</i> ", McGraw-Hill.	

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Physical Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various mathematical concepts for Chemistry. 2. Introduction of topics viz. magnetic materials and properties, photochemistry, Nano materials.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry. 3. Students shall be in a position to answer the NET / SET examination questions based on these topics.	
Content:	<p>1.Mathematical Preparations:</p> <p>1.1 Introduction to various functions and function plotting (exponential, logarithmic, trigonometric etc.), functions of many variables. Complex numbers and complex functions.</p> <p>1.2 .Linear equations, vectors, matrices and determinants.</p> <p>1.3 Basic rules of differentiation and integration, Partial differentiation, location and characterization of critical points of a function, Regression methods, curve fitting.</p> <p>1.4 Introduction to series, convergence and divergence, power series, Fourier series, Fourier transformations and Numerical methods</p> <p>2.Magnetic Properties</p> <p>2.1 Types of magnetism (dia, para, ferro, antiferro and ferrimagnetism) Magnetic susceptibility and its determination.</p> <p>2.2 Magnetization curves and hysteresis, magnetic anisotropy, magnetic exchange interactions, Neel temperature and magnetic transition.</p> <p>2.3 Ceramic magnetic materials, Applications of magnetic Materials</p> <p>3.Photochemistry:</p> <p>3.1 Absorption and emission of radiation of photochemical interest. Einstein's equation.</p> <p>3.2 Jablonskii's diagram illustrating fluorescence and phosphorescence.</p> <p>3.3 Prompt and Delayed Fluorescence. Factors affecting Fluorescence life time and quantum yield.</p> <p>3.4 Flash photolysis and lasers. Photosensitised reactions and photosynthesis.</p> <p>4. Nanomaterials:</p> <p>4.1 Introduction, Chemical synthesis and methods of structural characterization.</p>	<p>18 hrs</p> <p>08 hrs</p> <p>06 hrs</p> <p>04 hrs</p>

	4.2 Areas of application, Societal health and environmental impact.	
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / self-study / or a combination of some of these can be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Annexure-I

M Sc Part-II Revised Syllabus April 2019

Code	Title	Credits
	CORE PAPERS	
ANALYTICAL CHEMISTRY		
ACC -501	Fundamentals of Chemical Analysis	3
ACC- 502	Techniques in Chemical Analysis	3
ACC -503	Separation Techniques	3
ACC -504	Spectral methods of analysis	3
ACC- 505	Experiments in Analytical Chemistry	3
INORGANIC CHEMISTRY		
ICC -501	Coordination and Organometallic Chemistry	3
ICC- 502	Materials Chemistry	3
ICC- 503	Group Theory and Spectroscopy	3
ICC -504	Selected Topics in Inorganic Chemistry-I	3
ICC -505	Experiments in Inorganic Chemistry	3
ORGANIC CHEMISTRY		
OCC- 501	Organic Spectroscopy	3
OCC-502	Reaction Mechanisms, Stereochemistry and Asymmetric Synthesis	3
OCC- 503	Synthetic Methods in Organic Chemistry	3
OCC -504	Pericyclic and Organic Photochemical Reactions	3
OCC-505	Organic mixture separation and identification	3
PHYSICAL CHEMISTRY		
PCC-501	Quantum Chemistry and Statistical Thermodynamics	3
PCC-502	Thermodynamics and Reaction Kinetics	3
PCC-503	Electrochemistry and Surface Studies	3
PCC-504	Group Theory and Spectroscopy	3
PCC-505	Experiments in Physical Chemistry	3
PHARMACEUTICAL CHEMISTRY		
HCC-501	Pharmaceutical Chemistry II	3
HCC-502	Drug Product Formulation And Development	3
HCC-503	Drug Design And Development	3
HCC-504	Drug Quality And Regulatory Affairs	3
HCC-505	Laboratory Course In Pharmaceutical Chemistry	3
	OPTIONAL PAPERS	
ANALYTICAL CHEMISTRY		
ACO 501	Spectral Methods of Analysis	3
ACO 502	Calibrations and Validation	3
ACO 503	Advanced Mass Spectrometry	3
ACO 504	Environmental control and chemical analysis	3
ACO 505	Problems on Combined Spectroscopy	3
ACO 506	Chemometrics	3
INORGANIC CHEMISTRY		
ICO 501	Bioinorganic Chemistry	3
ICO 502	Catalysis: The basic Chemical concepts	3
ICO 503	Chemistry of P-Block Elements	3

ORGANIC CHEMISTRY		
OCO-501	Chemistry of Natural Products	3
OCO-502	Organometallic Chemistry	3
OCO-503	Introduction to Medicinal Chemistry	3
OCO-504	Retrosynthesis in Organic Chemistry	3
OCO-505	Heterocyclic Chemistry	3
OCO-506	Introduction to Polymer Chemistry-I: Basic Concepts	3
OCO-507	Introduction to Polymer Chemistry-II: Synthesis of Polymers and Processing	3
OCO-508	Selected experiments in Organic Chemistry-I	4
OCO-509	Chemistry of Life	3
PHYSICAL CHEMISTRY		
PCO-501	Solid State Chemistry I: Concepts and applications	3
PCO-502	Catalysis: Fundamentals and Applications	3
PCO-503	Solid State Chemistry II: Characterization of solid materials	3
PCO-504	Chemical kinetics and reaction dynamics	3
PCO-505	Colloids and Surface Science	3
PCO-506	Nanoscience: Concepts and Applications	3
PHARMACEUTICAL CHEMISTRY		
HCO-501	Pharmacological and Toxicological Screening Techniques	3
HCO-502	Calibration and Validation	3
HCO-503	Polymers in Pharmaceuticals and novel drug delivery systems	3
HCO-504	Biopharmaceutics	3
HCO-505	Pharmaceutical Technology	3
HCO-506	Pharmaceutical Stability	3
HCO-507	Laboratory Course in Natural Product Analysis	3
HCO-508	Laboratory Course in Drug Product Formulation and Development	4
HCO-509	Laboratory Course in Drug Design, Molecular Docking and Patents	2
HCO-510	Laboratory Course in Quality Control and Quality Assurance	4
GENERAL OPTIONAL		
CGO-500	Dissertation (as given in OA 18A)	8
CGO: 501	Selected Experiments in Chemistry	8

M.Sc. PART II SYLLABUS IN ANALYTICAL CHEMISTRY
M. Sc. PART II: ANALYTICAL CHEMISTRY

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-501

Title of the Course: Fundamentals of Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge about difference between analytical chemistry and chemical analysis, role of analytical chemist, differences between conventional method of analysis and instrumental methods.	
Course Objectives:	<ol style="list-style-type: none">1. Introduction to the various chemical method of analysis, details of underlying principle of chemical methods, advantages and limitations2. Application of chemical methods for qualitative and quantitative estimation	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand basic principle behind different conventional method of analysis.2. Student should understand the limitation of method of analysis, should be in a position to choose for appropriate chemical method for particular analysis3. Students should be in a position to understand the basic chemistry on which the method of analysis based on.	
Content:	<p>1 Acid-Base Titrations Theory of acid-base indicators for Acid-Base titrations; colour change; range of indicator; selection of proper indicator; indicator errors; neutralization curves for strong acid-strong base, weak acid-strong base and weak base-strong acid weak acid-weak base titrations; poly functional acids and bases; titration curves for poly functional acids and bases; titration curves for amphoteric species; determining the equivalence point; feasibility of acid - base titrations; magnitude of the equilibrium constant; effect of concentration; typical applications of acid-base titrations.</p> <p>2 Precipitation titrations Introduction; feasibility of precipitation titrations; titration curves; effect of titrant and analyte concentration on titration curves; effect of reaction completeness on titration curves; titration curves for mixture of anions; indicators for precipitation titrations; the Volhard, the Mohr and the Fajans methods</p> <p>3 Complexometric titrations The complex formation reactions; stability of complexes; stepwise formation constants; organic complexing agents; amino carboxylic acid titration; EDTA; acidic properties of EDTA; EDTA complexes with metal ions; equilibrium calculations involving EDTA in solution; condition of formation constants; EDTA titration curves; effect of other complexing agents on EDTA; factor affecting the titration curves; completeness of reaction; indicators for EDTA titrations; theory of common indicators; titration methods using EDTA- direct titration, back titration and displacement titration; indirect determinations; titration of mixtures; selectivity, masking and demasking agents; applications of EDTA titrations- hardness of water; magnesium and Al in antacids; magnesium, manganese and zinc in a mixture.</p>	<p>10 hrs</p> <p>3hrs</p> <p>8hrs</p>

	4. Basic concepts in Electrochemical Titrations Faradic and non-Faradic currents; reversible and irreversible cells; EMF series; standard electrode potential; Nernst equation; calculation of cell potential; effect of current; ohmic potential; polarization; decomposition potential; over voltage; concentration polarization; mechanism of mass transport; introduction to potentiometric methods 5. Redox titrations Redox Titrations: Equilibrium constants for redox reactions- electrode potentials in equilibrium systems; calculation of equilibrium constants; redox titration curves- formal redox potentials; derivation of titration curves; factors affecting the shape of titration curves concentration; completeness of reaction; titration of mixtures- feasibility of redox titrations; detection of end point and redox indicators; structural aspect of redox indicators; specific and nonspecific indicators; choice of indicator; potentiometric end point detection; sample preparation- pre-reduction and pre-oxidation. 6. Radioimmunoassay Radioimmunoassay; its principle and applications; instrumentation for radio bioassay; clinical application of the radioimmunoassay of insulin, estrogen and progesterone; receptor techniques of breast cancer; enzyme- linked immunosorbent assay; principles; practical aspects; applications. 7. Gravimetric analysis Introduction; properties of precipitates and precipitating reagents; completeness of precipitates; super saturation and precipitate formation; particle size and filterability of precipitates; colloidal precipitates; crystalline precipitates; purity of the precipitate; co-precipitation, post precipitation; conditions for precipitation; fractional precipitation; precipitation from homogenous solution; organic reagent as precipitants-dimethyl gloxime, oxine, cupferon, salicyldoxime, washing of precipitates; drying and ignition of precipitates; calculation of results from gravimetric data; applications.	3 hrs
		4 hrs
		3 hrs
		5hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-502

Title of the Course: Techniques in Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques such as colorimetry, pH-metry, emission techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
<u>Course Objectives:</u>	1. Introduction of various experimental techniques for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
<u>Course Outcomes:</u>	1. Students should be in a position to differentiate between various analytical techniques based on their theory and sensitivity achieved. 2. Exposure to various electrochemical and optical techniques for its application to qualitative and quantitative estimation at trace level.	
<u>Content:</u>	1. Principles and practise of optical analytical techniques –Part-1 1.1. Nephelometry and Turbidimetry: Introduction to principle, instrumentation and application of nephelometry, turbidimetry. Factors affecting measurement, choice between nephelometry and turbidimetry; turbidimetry and colorimetry; nephelometry and fluorimetry; applications of nephelometry and turbidimetry. 1.2. Introduction, principle and Instrumentation of Polarimetry; application of optical rotation method in rate constant determination; acid- catalyzed muta rotation of glucose; inversion of cane sugar; relative strengths of acids. Introduction to terms such as optical rotatory dispersion (ORD), plan curves, cotton effect curves, circular dichroism, octant rule for ketones.	10hrs
	2. Principles and practise of optical analytical techniques –Part-2 2.1. Principles and practices of Spectrophotometric Analysis: Introduction; law of absorption; absorbance and transmittance spectrum; technique for colour comparison; spectrophotometer instrumentation- single and double beam spectrophotometer; applications 2.2. Principles of Emission Techniques: Theory; excitation techniques; electrodes and their shapes; Quantitative and qualitative application, brief introduction to ICP-MS	10hrs
	3. Principles and practise of electro analytical and thermal techniques 3.1. Introduction to Ion selective electrodes; construction, application and selectivity coefficient of Ion selective electrode; pH measurement; buffer solution; glass electrode; instrument for pH measurement. 3.2. Thermoanalytical Methods: Thermogravimetry, Differential Thermal Analysis (DTA), and Differential Scanning Calorimetry: DSC 3.3. Basic aspects of conductometric titration; types of conductometric titration; advantages and disadvantages of conductometric titration;	16hrs

	<p>Introduction; theory; instrumentation; advantages, disadvantages and applications of High frequency titrations.</p> <p>3.4. Karl Fischer Titration: Introduction; theory; instrumentation; advantages, disadvantages and applications; Karl Fischer reagent- Introduction; determination of water content in industrial samples.</p>	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling at MSc part-I level.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different separation techniques used for qualitative, quantitative estimation	
Course Outcomes:	1. Students should be in a position to understand principle behind different purification techniques. 2. Students should be in a position to select the separation techniques for purification of analytes from interferents. 3. To understand the HPLC method development and application in qualitative and quantitative analysis	
Content:	<p>1. Basic Separation Technique:</p> <p>1.1. General aspects of separation techniques-role of separation technique in analysis;</p> <p>1.2. Separating the analyte from interferents</p> <p>1.3. General theory of separation efficiency: Separation factor</p> <p>1.4. Classifying separation techniques: Separations based on Size; Separations based on mass or density, Separations based on complexation reactions (Masking); Separations based on a change of state; Separations based on a partitioning between phases. (Note: Following techniques shall be discussed as representative example)</p> <p>1.5. Basic principles of distillation; theory of vacuum, steam, azeotropic and fractional distillation.</p> <p>1.6. Fractionation by solvent extraction: based on chemical nature and based on polarity of analyte.</p> <p>1.7. Centrifugation techniques: Sedimentation velocity, Analytical and preparative centrifugation; Density gradient centrifugation; applications in separation.</p> <p>2. Chromatographic Methods:</p> <p>2.1. Introduction to chromatography: definitions, theories, principles of chromatographic technique, terms and parameters used in chromatography, classification of chromatographic methods, Partition versus adsorption chromatography, development of chromatograms, qualitative and quantitative analysis by chromatography;</p> <p>2.2. Planar Chromatography (Paper and thin layer):</p> <p>2.2.1. Paper Chromatography- introduction, principle, theory, types (ascending, descending, circular, two dimensional paper chromatography); techniques; choice of solvent; multiple development, qualitative and quantitative measurement applications;</p> <p>2.2.2 Thin Layer Chromatography (TLC)- definition; mechanism; efficiency of thin layer plates; methodology (technique); criteria</p>	<p>6 hrs</p> <p>24hrs</p>

	<p>for selection of stationary and mobile phases (numerical to calculate elution strength of mixed solvents used as mobile phase); choice of adsorbents; preparation of plates; spotting (spot capacity); development of chromatogram; identification and detection using physical and chemical methods; reproducibility of R_f values and improving resolution; Two-dimensional TLC; comparison of TLC with paper chromatography, column chromatography, thin layer ionophoresis and electrophoresis; Qualitative, quantitative evaluation and applications;</p> <p>2.3. High-performance TLC (HPTLC): introduction, principle, theory, classification (classical, high performance, ultra, preparative HPTLC); Difference between TLC and HPTLC with respects to the parameters; scanning densitometer; Quantitative analysis using TLC-densitogram and applications.</p> <p>2.4. Gas Chromatography (GC): Instrumentation, selection of operating condition, choices of GC column, methods to prepare derivatives of samples (silylation, acylation, alkylation), working principle of GC detectors such as TCD, ECD, FID, Analysis of GC data and quantification methods such as normalizing peak area, internal std., external std, standard addition.</p> <p>2.5. Column Chromatography- definition; types (conventional, flash, LPLC, Dry column vacuum chromatography); principle; packing, loading, eluting and collecting eluent in the column chromatography and experimental requirements; theory of development; migration rates of solutes; band broadening and column efficiency; variables that affect column efficiency; Van Deemeter equation and its modern version; scale-up and thump rule for conventional column, qualitative and quantitative analysis; applications.</p> <p>2.6. Liquid-liquid partition chromatography (HPLC)- Introduction; selection of stationary and mobile phase; types of bonded phase chromatography-NPC and RPC and stationary phases used; reversed phase partition chromatography; steps in HPLC method development in partition chromatography- elution techniques (isocratic and gradient, ion pairing agents, buffer agents, organic modifiers); optimization of capacity factor, gradient selectivity factor and column plate numbers; numerical on method development using Snyder's polarity index. Preparative vs analytical HPLC; Chiral chromatography- Pirkle stationary phases, examples of enantiomer separation such as ibuprofen, calculation of enantiomeric excess. Choosing detectors- working principle of RI, UV-Vis, conductivity and ELSD.</p> <p>2.7. Size Exclusion Chromatography: definition; theory; principle; types; stationary phases in gel chromatography; physical and chemical characteristics of gel, mechanism of gel permeation chromatography (GPC); instrumentation of GPC; applications of GPC- determination of molecular weight of polymer with numericals.</p> <p>2.8. Supercritical-Fluid Chromatography: introduction; important properties of supercritical-fluids; instrumentation and variables, SFC column vs other column, applications.</p>	
--	---	--

	3. Electrophoresis: 3.1. Theory of electrophoresis; Type of electrophoresis- Free solution and supporting medium electrophoresis, paper electrophoresis, capillary electrophoresis and gel electrophoresis. 3.2. Capillary electrophoresis-instrumentation, sample introduction in CE, types of CE methodology, electrophoretic mobility and electroosmotic mobility, total mobility, efficiency and resolution in CE column, numericals. 3.3. Gel electrophoresis - types of gel, Polyacrylamide gel electrophoresis PAGE, Agarose GE, factors affecting separation; 3.4. Staining and detecting electrophoresis band; 3.5. Separation of neutral molecule by MEKC; 3.6. Separation and determination of Vitamin B-complex by using CZE and MEKC.	6 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-504

Title of the Course: Spectral methods of analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
Course Objectives:	1. Introduction of various spectral methods for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
Course Outcomes:	1. Students should be in a position to understand theory and instrumentation of various spectral methods of analysis. 2. Understanding application of studied methods for qualitative and quantitative estimation at trace level.	
Content:	1. Automation of Analytical Method: An overview of automated system; definition; distinction between automatic and automated system; advantages and disadvantages by automation; types of automated techniques. Discrete and continuous automation, Introduction to Flow injection analysis.	5 hrs
	2. X-ray Absorption, Diffraction; Neutron Diffraction and Fluorescence Spectroscopy: Introduction; origin of X-rays; interaction of X-ray with matter; X-ray spectrometer; theory of X-ray absorption; X-ray diffraction by crystal; comparison of X-ray absorption with X-ray diffraction; Bragg's law; interpretation of X-ray diffraction powder pattern; calculation of lattice parameters; neutron diffraction introduction; theory; instrumentation and applications; X-ray fluorescence- introduction; applications. Introduction to Mossbauer spectroscopy; theory and application.	10hrs
	3. Molecular Fluorescence, Phosphorescence and Chemiluminescence Spectroscopy: Introduction; meaning of luminescence and chemiluminescence; principles of fluorescence, chemical structure and fluorescence; theory of molecular fluorescence; instrumentation- single and double beam filter fluorimeters, relationship between intensity of fluorescence and concentration; spectrofluorometer; phosphorimeter; factors influencing fluorescence and phosphorescence; basic differences in measurement of fluorescence and phosphorescence; advantages; limitations and precautions; selection of excitation wavelength for analysis; reporting fluorescence spectra; applications of fluorimetric analysis. Chemiluminescence: Introduction; principle; types; chemiluminescence with Luminol, instrumentation; measurement of chemiluminescence; quantitative chemiluminescence; Introduction to gas phase chemiluminescence analysis, chemiluminescence titrations and electro-chemiluminescence.	12hrs
	4. Microscopy: Chemical microscopy- microscope; parts and optical path; numerical aperture and significance; applications and qualitative and quantitative study;	9 hrs

	Electron microscopy- principle, operation, sample preparation, replicas, shadowing, application to analysis; electron probe analyzer, ion microscope; metallography- metallurgy, microscopic examination; specimen preparation and examination; interpretation of micrographs; SEM, TEM, AFM. Introduction to Magnetic resonance imaging (MRI) technique and Photo acoustic spectroscopy ; theory and applications	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-505

Title of the Course: Experiments in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses in Analytical Chemistry Practicals at MSc-I levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	1. Introduction of various experimental techniques for analysis. 2. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	1. Students should be in a position to use standardized material to determine an unknown concentration. 2. To gain experience with some statistics to analyse data in lab 3. Student should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p>This course consists of 7 units of experiments in various areas of Analytical chemistry. Minimum 14 experiments shall be carried out and at-least 2 experiments from each unit.</p> <p>UNIT 1: Analysis of Pharmaceutical Tablets/Samples</p> <ol style="list-style-type: none">1. Estimation of streptomycin in tablet sample by Maltol method2. Estimation of Ibuprofen / Paracetamol3. Estimation of sulphadiazine / sulphonamide4. Determination of moisture content in tablet powder by Karl Fischer titration <p>UNIT 2: Planar and column Chromatography</p> <ol style="list-style-type: none">1. Separation of alpha amino acids by paper chromatography and to study effect of mobile phase on resolution.2. Thin layer chromatography analysis of commercial available analgesic and to identify the active ingredients.3. Purification and determination of amount of paracetamol from commercial tablet by column chromatography4. Separation of a mixture of benzoin and benzil on silica gel column <p>UNIT 3: Ion exchange Chromatography and Solvent Extraction Method</p> <ol style="list-style-type: none">1. To determine the capacity of a cation exchange resin2. To separate organic mixture (acidic+basic+Neutral) by extraction3. To separation and estimate the zinc and nickel ions using an anion exchange resin4. To determine the Fe ion as Fe-oxine complex <p>UNIT 4: HPLC Analysis:</p> <ol style="list-style-type: none">1. HPLC analysis of benzaldehyde and benzyl alcohol using isocratic elution2. To study HPLC method development by using linear and stepwise gradient elution for binary system3. To analyze a mixture (benzene and toluene, anthracene and naphthalene) by Reverse phase-HPLC4. HPLC analysis of Analgesics in a commercial sample/tablet, Ibuprofen to develop and validate the analytical method of any one drug using HPLC	

	<p>UNIT 5: Gas Chromatographic Analysis:</p> <ol style="list-style-type: none"> 1. Quantitative analysis of a mixture of chloroform and carbon tetrachloride 2. Gas chromatographic analysis for a mixture of gases like O₂, N₂ and CO₂ <p>UNIT 6: Spectrophotometry Method:</p> <ol style="list-style-type: none"> 1. To determine pk value of methyl red indicator at room temperature 2. To determine the stoichiometry and stability constant of ferric salicylic acid complex by Job's method and mole ratio method 3. To determine the amount of each caffeine and benzoic acid from the soft drink by UV spectrophotometry. 4. To record UV absorption spectrum of acetone in n-hexane and in water to identify the various transition. <p>UNIT 7: Electrochemical Method:</p> <ol style="list-style-type: none"> 1. pH-metric determination of hydrolysis constant of aniline hydrochloride 2. pH-metric determination of the acid-base dissociation constant and isoelectric point of amino acid 	
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-501

Title of the Course: Bioanalytical and Forensic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the analytical chemistry at T Y B Sc (Chemistry) and M Sc part-I (Chemistry) levels.	
Course Objectives:	1. The purpose of this course is to provide basic understanding of medical laboratory clinical chemistry and forensic chemistry 2. Identify various types of evidence that may be collected at a crime scene including procedures for identification, collection, and analysis for the purpose of investigating and prosecuting crimes.	
Course Outcomes:	1. Apply principles of safety, quality assurance and quality control in clinical and forensic chemistry. 2. The students should be in position to select methods required for forensic and clinical sample analysis. 3. The students will be in a position to understand the principal and applications of various analytical methods used in clinical and forensic laboratory.	
Content:	1. Clinical Chemistry: 1.1. Composition body fluid; detection of abnormal levels of certain constituents leading to diagnosis of diseases; sample collection and preservation of physiological fluids; 1.2. analysis of physiological fluids- blood, urine and serum; estimation of blood glucose, cholesterol, urea, haemoglobin; urine-urea, uric acid, albumin, globulins, barbiturates, acid and alkaline phosphates;	7 hrs
	2. Human-nutrition: Estimation of enzymes, carbohydrates, essential amino acids, proteins and lipids.	4 hrs
	3. Food Analysis, Processing and Preservation: 3.1. Analysis of food such as milk, milk products, tea, coffee and beverages (soft drinks, alcoholic drinks), Flour, starch, honey, jams and edible oils. Analysis of preservatives, coloring matter, micronutrients. 3.2. Food processing and food preservation: Refining milling, canning, concentration, freezing Drying, pasteurisation sterilization irradiation.	8 hrs
	4. Forensic Science: Chemistry, Narcotics and toxicology 4.1. Narcotics and Psychotropic Substances Act: psychotropic substance; prohibition control; regulation offence and penalties. 4.2. Forensic Chemistry: Its role in crime; Types of cases received for Analysis; Procedures for sample selection, collection, preservation, identification. 4.3. Forensic chemical analysis of samples using classical and modern instrumental techniques: Analysis of alcohol and other spurious liquor, Examination of Petroleum products, Construction material for adulteration; Examination of burnt remains in arson cases; Analysis of dyes chemicals seized in crime; Types of explosives; commonly used explosives; their handling; analysis and	17hrs

	<p>identification of explosive residues.</p> <p>4.4. Narcotics: Definition; Narcotic drugs and Psychotropic; substances; Problems of drug abuse; drug addiction.</p> <p>4.5. Classification of Narcotic drugs;</p> <p>4.6. Identification of narcotic drugs by spot tests and other classical Methods for following drugs. (a) Narcotics- heroin and cocaine. (b) Stimulants- caffeine, amphetamines; (c) Depressants- Barbiturates, Benzodiazepines. (d) Hallucinogens- LSD</p> <p>4.7. Extraction of Narcotic drugs from different matrices; Isolation, purification, identification and estimation.</p> <p>4.8. Examination of Narcotic drugs using modern instrumental methods</p> <p>4.9. Toxicology: Definition; Its role in crime; Classification of poisons; commonly used poisons; signs and symptoms of poisoning; Sample collection, Handling and packing.</p> <p>4.10. Analytical Toxicology; Extraction of poisons from various matrices including visceral samples; Isolation; Purification identification and interpretation of findings. Use of both Classical and Modern Instrumental methods of chemical analysis of poisons.</p>	
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-502

Title of the Course: Calibration and Validation in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-2020

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques and statistical calculations related to topic. Knowledge of M.Sc.-Part I analytical courses is essential for better understanding of the course content	
Course Objectives:	1. Introduction of various aspect of calibration and validation 2. Study validation parameters and qualification of instrument	
Course Outcomes:	Students should be able to understand about calibration/validation and how it can be applied to industry and thus improve the quality of the products. The subject covers the complete information about basics of calibration & validation, types, methodology and application, the qualification of various equipment's and instruments.	
Content:	1. Calibration Significance of calibration in analytical chemistry. Standardizing methods; standards used, certified reference material. Blanks and controls; types and significance Statistical evaluation of analytical results; relative error, standard deviation, knowledge of q test, test of significance, linear Least Squares estimation and coefficient of regression Errors in calibration, Modes and protocols of calibration; External standard method, Standard addition method, Spiking, Internal standard method and standard bracket method. Introduction to common apparatus used in analytical laboratory and their calibration; volumetric glassware, Analytical Balances, pH meter, Oven and lab Refrigerator Excel-charts for calibration plot.	13 hrs
	2. Validation and qualification Introduction to validation, Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Validation and qualification, Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment. Regulatory requirements for analytical method validation International conference on harmonization (ICH) guideline Q2A Introduction to QA / QC, Safety Practices in a Chemical Laboratory	11 hrs
	3. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation	12 hrs

	Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-503

Title of the Course: Advanced Mass Spectrometry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. part-I (Chemistry) levels.	
Course Objectives:	1. Study of various theoretical concepts related to mass spectroscopic techniques. 2. Introduction of tandem mass spectrometry techniques. 3. Learning interpretational aspects of spectral data obtained from hyphenated techniques	
Course Outcomes:	1. Students should be in a position to understand principle behind different ionizations sources. 2. Students should be in a position to select mass analysers and ionization sources for analysis of particular type of analyte. 3. Students should be in a position to deduce structures of simple to moderately complex molecules/biomolecules by combining the spectral data obtained from hyphenated techniques.	
Content:	1. Introduction Mass spectrometry principle, general instrumentation, general interpretation procedure for mass spectra;	2 hrs
	2. Ionization methods: 2.1. Gas Phase ionization: electron ionization (EI), chemical ionization (CI), Field ionization and field desorption (FI, FD) 2.2. Particle Bombardment: Fast atom bombardment (FAB); Secondary ion mass spectrometry (SIMS) 2.3. Atmospheric pressure ionization: electrospray ionization (ESI), atmospheric pressure ionization (APCI) 2.4. Laser Desorption: MALDI 2.5. Inorganic ionization sources: thermal ionization; Spark source; Glow discharge, Inductively couple plasma (ICP)	10 hrs
	3. Mass analyzers: 3.1. Characteristics of analysers: nominal mass, mass accuracy, resolving power, resolutions, numericals to calculate nominal and accurate mass 3.2. Magnetic, electromagnetic and double focusing 3.3. Single Quadrupole and triple quadrupole 3.4. Time of flight analyser 3.5. Ion cyclotron resonance analyzer, 3.6. hybrid instrumentation 3.7. Detectors: electron multiplier, photon multiplier, Faraday cup (Note: instrumentation, working principles, characteristic features, advantages, practical consideration shall be discuss).	8 hrs
	3. Hyphenated Techniques: 3.1. Coupled techniques; Interface and their characteristic features; Importance of hyphenation of two analytical techniques; 3.2. Introduction and instrumentation of following techniques: GC-FTIR, GC-MS, LC-MS, MS-MS (tandem) mass spectrometry (use of	8 hrs

	<p>stable isotopes), ICP-MS, TG-MS.</p> <p>3.3. Analysis of chromatogram obtained from hyphenated techniques: Total ion chromatogram (TIC), Extracted Ion chromatogram (XIC).</p> <p>4. Tandem Mass spectrometry applications:</p> <p>4.1. Pharmacokinetic studies: Fate of drug in living organisms, metabolite identification, biotransformation of ziprasidone</p> <p>4.2. Tandem MS and fragmentation pattern of following drugs: Paracetamol, 2-mercaptopyruvic acid, Sulfasalazine, Narcotics-amphetamine,</p> <p>4.3. Analysis of biomolecules-Protein and peptides: structure and sequence determination using fragmentation, solve problems based on MS/MS data.</p>	8 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-505

Title of the Course: Problems on combined Spectroscopy

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Study of various theoretical concepts related to organic spectroscopic techniques. 2. Introduction of commonly used 2D NMR techniques. 3. Learning interpretational aspects of spectral data pertaining to IR, PMR, CMR and MS.	
Course Outcome	1. Students should be in a position to deduce structures of simple to moderately complex molecules by combining the spectral data obtained using two or more spectral techniques. 2. Students should be in a position to apply various concepts in organic spectroscopy (PMR, CMR, MS and 2D NMR) and generate/ predict PMR, CMR, MS and 2D NMR spectral data based on given structures of simple molecules.	
Content:	1. Electronic and Infrared Spectroscopy: basic concepts; Application of electronic and IR spectroscopy in structural elucidation of organic compounds	04 hrs
	2. NMR Spectroscopy: Theory of Nuclear magnetic resonance, quantum description of NMR, classical description of NMR, Types of NMR spectra, environmental effects of NMR Spectra, the chemical shift, Applications of proton NMR in qualitative and quantitative analysis (in general).	05 hrs
	3. ^{13}C –NMR spectroscopy: Introduction, proton coupled and proton decoupled ^{13}C - spectra. Off- resonance decoupling, APT & DEPT techniques; ^{13}C chemical shifts – factors affecting the chemical shifts – Homonuclear (^{13}C - ^{13}C J) and heteronuclear (^{13}C – ^1H , ^{13}C – ^2H J) couplings.	06 hrs
	4. Two-dimensional NMR spectroscopy: Introduction to 2D-NMR, Classification of 2D experiments- 2DJ resolved spectroscopy; interpretation of spectra of simple organic compounds using following 2D-NMR techniques-COSY, NOESY, HSQC, HMQC, HMBC, TOCSY and INADEQUATE	07 hrs
	5. Identification of organic compounds using combined spectral methods: UV, IR, PMR, CMR, 2D NMR, Mass <i>(Note: More emphasis shall be given for solving combined spectroscopic data for structural elucidation)</i>	14 hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/	

	presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-506

Title of the Course: Chemometrics

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Introduction of various chemistry software used in quantification and calculations 2. Study validation parameters and qualification of instrument	
Course Outcome	Students should be able to understand about various software in chemometric and how it can be applied to analysis and thus improve the quality of the products. The subject covers the complete information about software and their application in quantifications.	
Content:	<p>1. Introduction to Data and Statistics: Introduction; Univariate Statistics Review, Probability, Variance and Sampling, Linear Regression and Calibration Data, Digitization, and the Nyquist Theorem, Detection Limit, S/N ratio, and Signal Filtering; Review of Linear Algebra: Scalars, Vectors, and Matrices, Matrix Notation and Matrix Operations Orthogonality, Analysis of Variance (ANOVA) - 1 Variable, Analysis of Variance - 2 Variables; Introduction to MatlabTM: Program Basics and Layout, Matrix Operations in MatlabTM The Diary Command and Examples, ANOVA in MatlabTM; Experimental Design: Factorial Design, Simple <i>versus</i> Complex Models, Factorial Design in MatlabTM ; Half-Factorial Design.</p> <p>2. Multivariate Methods I: Introduction to various multivariate methods; the Six Habits of a Chemometrician; Principle Component Analysis (PCA); data pretreatment- Mean Centering and Normalization; PCA in MatlabTM.</p> <p>3. Multivariate Methods II: Classical Least Squares (CLS), CLS in MatlabTM; Inverse Least Squares (ILS).</p> <p>4. Multivariate Methods III: Multiple Linear Regression (MLR); Principle Component Regression (PCR); Partial Least Squares, Examples in MatlabTM; Summary of Multivariate Methods; Pattern Recognition- Supervised versus Unsupervised Pattern Recognition, K Nearest Neighbours (KNN); Soft Independent Modelling for Chemical Analysis(SIMCA), Summary of Pattern Recognition.</p> <p>5. Computers in Chemistry: The students shall learn how to operate a PC and run standard programs and packages like MS-WORD, EXCEL, ORIGIN, SIGMA PLOT, and CHEM SKETCH; to solve Chemistry numerical (numerical taken preferably from Physical Chemistry for plotting first and second derivative curves, linear plots); numerical from Analytical Chemistry, Chemical Kinetics, Electrochemistry, Spectroscopy and other related topics; writing the structures of inorganic and organic molecules, chemical equations and other</p>	<p>10 hrs</p> <p>05 hrs</p> <p>04 hrs</p> <p>07 hrs</p> <p>10 hrs.</p>

	interesting applications will be taught.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

M Sc-II Inorganic chemistry
Semester III and IV Courses (Academic year 2019-2020 onwards)

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits
ICC 501	Coordination and organometallic Chemistry	3	ICO 501	Bioinorganic Chemistry	3
ICC 502	Materials Chemistry	3	ICO 502	Catalysis: The Basic Chemical concepts	3
ICC 503	Group Theory and Spectroscopy	3	ICO 503	Chemistry of P-Block Elements	3
ICC 504	Selected Topics in Inorganic Chemistry - I	3			
ICC 505	Experiments in Inorganic Chemistry	3	General Optional Courses		
			CGO-500	Dissertation	8
			CGO-501	Selected Experiments in Chemistry	8

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-501

Title of the Course: Coordination and organometallic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To make understand the electronic structure of compounds of d-block elements.2. To provide sufficient knowledge of CFT and MOT in coordination and organometallic compounds.3. To understand interpretation of magnetic and electronic properties of coordination compounds.4. To understand fundamental concepts of inorganic chemistry reaction mechanisms5. To provide knowledge on applications of organometallic compounds in homogenous catalysis.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the electronic structure of coordination and organometallic compounds.2. They will be well equipped with knowledge of CFT and MOT3. They will be in position to understand the magnetic and electronic properties.4. The concepts of inorganic reactions will be clear to them.5. They will know the applications of organometallic compounds in industries	
Content:	<p>1. Electronic structure of coordination compounds:</p> <p>1.1 Crystal field theory and its applications: a) Octahedral compounds; b) tetrahedral compounds; c) square-planar compounds and other geometries; d) tetragonally distorted compounds (Jahn-Teller Effect); e) octahedral vs tetrahedral</p> <p>1.2 Ligand field theory: a) σ bonding; b) π-bonding</p> <p>2. Magnetic Properties coordination compounds</p> <p>a) diamagnetism, b) paramagnetism; c) ferromagnetism, d) antiferromagnetism, d) temperature dependence magnetism; Curie law, Curie-Weiss Law.; e) spin cross over phenomenon</p> <p>3. Spectra of coordination compounds</p> <p>3.1 Electronic structure of atoms: a) spectroscopic terms; b) classification of microstates and energies of the terms; d) Racah parameters</p> <p>3.2 Electronic spectra: a) ligand field transitions; b) selection rules; c) spectroscopic terms of complexed ion; d) correlation and Orgel diagrams; d) Tanabe-Sugano diagrams; e) Charge-Transfer bands: LMCT transitions and MLCT transitions; f) Luminescence</p> <p>4. Inorganic reaction mechanisms:</p> <p>4.1 Substitution reactions in coordination compounds; b)</p>	<p>8 hr</p> <p>2 hr</p> <p>8 hr</p> <p>8 hr</p>

	<p>thermodynamic considerations; c) kinetic considerations; d) substitution reactions in octahedral compounds; e) substitution reactions in square planar compounds.</p> <p>4.2 Electron transfer reactions: inner sphere and outer sphere mechanism, Frank Condon principle, Marcus equation</p> <p>5. Organometallic compounds and reactions Significance of 18 electron rule, metal carbonyls & nitrosyls, reactions of organometallic compounds, metal centered catalysis in complex compounds, homogenous catalysis such as hydrogenation, hydroformulations, coupling reactions and isomerization of alkanes. Asymmetric catalysis, stereochemically rigid molecules.</p>	10 hr
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICC-502

Title of the Course: Materials Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICC-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of Materials Chemistry	No. of Hours
Course Objective:	To provide basic and advanced knowledge about solid state chemistry	
Course Outcome	This course will give sufficient information about the preparation of different types of materials, their structures, reactivity and properties.	
Content:	<p>1. Introduction to Materials chemistry</p> <p>2. Structure and bonding in solid materials: Crystal lattice; unit cell; Miller indices and planes; X-ray diffraction method; metallic, covalent and ionic solids; structural classification of binary and tertiary compounds.</p> <p>3. Non-stoichiometry in material solids: Oxygen deficient oxides, metal deficient oxides and classification of non-stoichiometry.</p> <p>4. Crystal defects: Types of defects: Point defects; Dislocations: Line defects and Plane defects</p> <p>5. Materials preparation techniques: I) Ceramic method II) Different wet chemical methods: A) For Powder materials: Co-precipitation, Precursor, Combustion, Sol-gel, Spray roasting, Freeze drying. B) For Single crystals: i) Growth from melt ii) Flux method iii) Epitaxial growth of single crystal thin films: Chemical and Physical methods iv) Chemical vapour transport v) Hydrothermal method vi) Dry high pressure method. C) For Amorphous Materials D) For Nanomaterials</p> <p>6. Reactivity of Solid Materials: Tarnish reactions, decomposition reaction, solid-solid reactions, addition reactions, double decompositions reaction, electron transfer reaction, solid-gas reactions, sintering, factors influencing reactivity of solids.</p> <p>7. Phase Transformations in Solid Materials: Thermodynamic consideration, structural change in phase transformation, Martensite transformation, temperature and pressure induced transformations, order- disorder transitions,</p>	<p>1 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p> <p>7 hr</p> <p>3 hr</p> <p>3 hr</p>

	<p>electronic transition, transformation with a change in composition.</p> <p>8. Electrical Properties: Electrical conductivity, free electron theory, fermi energy, insulators, semiconductor and conductors, band theory of semiconductor, Brillouin zones, Hall effect, the Seebeck effect, Superconductivity, BCS theory, Meissner effect, high temperature superconductor.</p> <p>9. Semiconductor Devices: Diodes, transistors and Junction field effect transistor, light meter, photodiode, phototransistor, solar cells, light emitting diodes, laser materials.</p> <p>10. Optical and dielectric properties: Luminescence and phosphorescence, piezoelectric, ferroelectric materials and applications.</p> <p>11. Magnetic properties: Introduction to magnetism, behaviour of substance in a magnetic field, magnetic moments, diamagnetism, paramagnetism, experimental determinations of susceptibility, ferromagnetism, anti-ferromagnetism and ferrimagnetism.</p>	<p>4 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p>
Pedagogy:	Lectures/ tutorials/ self-study or a combination of some of these.

Programme: M. Sc. Part-II Inorganic Chemistry

Course Code: ICC-505

Title of the Course: Experiments in Inorganic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses ICC-401, ICC-402 and ICO-401 at M. Sc.-I level	No. of lectures
Course Objectives:	1. To introduce to practical knowledge in Inorganic Chemistry. 2. To learn techniques of crystallization of ligands and synthesis of coordination compounds 3. To learn characterization of compounds using different instruments 4. To provide experience of synthesis and characterization of materials 5. To introduce analysis of ores for metal content	
Course Outcomes:	1. Students will be in a position to understand general aspects involved in purification of ligands and synthesis of coordination of compounds 2. Students will be able to understand the methods for characterization of coordination compounds. 3. Students will be in a position to understand the solid state material synthesis and characterization. 4. Students will be able to separate metal ions by ion exchange chromatography. They will also gain knowledge about the analysis of ores and alloys	
Content:	<p>EXPERIMENTS IN INORGANIC CHEMISTRY <i>Total sixteen experiments to be performed from the following.</i></p> <p>Group – 1: Experiments in coordination chemistry: Ligand and complex synthesis, metal analysis (Minimum 3)</p> 1) Purification (distillation / recrystallization) of ligands like acacH, en, carboxylic acids etc) 2) Preparation of manganic tris(acetylacetonate) and estimation of manganese 3) Preparation of tris(thiourea) copper(I) sulfate and estimation of copper 4) Preparation of isomers; <i>cis</i> & <i>trans</i> dichloro-(ethylenediamine)-cobalt(III) chloride and estimation of cobalt 5) Preparation and resolution of tris(ethylenediamine)cobalt(III) ion and estimation of chloride 6) Preparation of <i>cis</i> and <i>trans</i> - potassium dioxalatodiaquo-chromate(III) and estimation of chromium 7) Preparation of nitro and nitrito-penta aminecobalt(III)chlorides and estimation of cobalt 8) IR spectral characterization of free ligands and coordinated ligands	18

	<p>9) Single crystal structure analysis <i>NOTE: In complex synthesis, the student is expected to recrystallize the product, record IR spectra and carry out metal analysis. Spectral analysis can be carried over.</i></p> <p>Group –2 Experiments in Solid State Chemistry (Minimum 3) 1) Preparation of spinel oxides by precursor method and estimation of metals in precursors and oxides, 2) Characterization of precursors by thermal analysis and infrared analysis 3) X-ray diffraction studies of oxides 4) Electrical characterization: i) Direct current electrical resistivity of semiconductor (Ge/Si) by Four Probe 4) Curie temperature determination of dielectric material (PZT) by measurement of dielectric constant v/s temperature 5) Measurement of magnetization parameter: M_s, M_r and H_c, 6) Determination of Curie temperature of magnetic oxides by A.C. susceptibility studies.</p> <p>Group – 3: Instrumental methods / spectral analysis / ion exchange (Minimum 3) A) Determination of stability constant of complex ions in solution 1) Fe(III) – thiocyanate compound B) Determination of instability constant of complex ions in solution 2) Determination of instability constant for the reaction between Ag^+ and NH_3 3) Determination of instability constant for the reaction between Ag^+ and en 4) Determination of instability constant for the reaction between Cu^{2+} and NH_3 5) Determination of instability constant for the reaction between Cu^{2+} and en C) Ion exchange chromatography 6) Separation of Mg^{2+} and Co^{2+}/Zn^{2+} by anion exchange column 7) Separation of transition metal cations by anion exchange column</p> <p>Group – 4: Ore / Alloy/ commercial sample analysis (Minimum 3) 1) Analysis of Goan Iron ore: Hematite / magnetite 2) Analysis of Devardas alloy 3) Analysis of Solder (Pb and Sn) 4) Analysis of Calcite/ Dolomite 5) Analysis of Pyrolusite 6) Analysis of Nickel-Aluminium alloy 7) Analysis of Brass / Bronze</p>	<p>18</p> <p>18</p> <p>18</p>
Pedagogy	Pre-labs, practical / self-study or a combination of some of these could also be used to some extent.

Programme: **M. Sc. Part-II (Inorganic Chemistry)**

Course Code: **ICO-501**

Title of the Course: **Bioinorganic Chemistry**

Number of Credits: **03**

Effective from AY: **2019-20**

Prerequisites for the course:	The students who have done MSc-I Chemistry core courses are eligible to attend	No. of lectures
Course Objectives:	1. To introduce, describe and highlight the role of inorganic elements especially metal ions in biology. 2. To describe the role of small molecular weight model compounds.	
Course Outcomes:	In addition to knowing the essential elements in biology the students will be able to understand the role played by metal ions in vital processes like i) oxygen storage and transport and ii) electron transfer.	
Course Content:	1. Essential elements in biology, distribution of elements in biosphere, bio-availability, bio-stability, building blocks of the biosphere; carbohydrates, nucleic acids and proteins, Biological importance of water, and brief review of the chemistry of biopolymers. Metallobiomolecules: classification of metallobiomolecules, metalloproteins (enzymes), metal activated proteins (enzymes), metal functions in metalloproteins, Principles of coordination chemistry related to bioinorganic research, physical methods in bioinorganic chemistry	6 hr
	2. Introduction, biological importance of the alkali and the alkaline earth cations, Cation transport through membranes (ion pumps). Photosynthesis, Hill reaction, Chlorin macrocycle and chlorophyll, Absorption of light by chlorophyll, role of metals in photosynthesis, in vitro photosynthesis.	6 hr
	3. Non redox metalloenzymes, zinc metalloenzymes like carboxypeptidase, carbonic anhydrase and alcohol dehydrogenase, Bio-functions of zinc enzymes, active site structure and model complexes.	6 hr
	4. Biochemistry of a few transition metals viz. Fe, Mo, Cu and Ni, Oxygen carriers and oxygen transport proteins, iron porphyrins (Haemoglobin and myoglobin). Haemocyanins and Haemerythrins, Synthetic models for oxygen binding haemproteins. cytochrome 'c', catalase peroxidase, and superoxide dismutase, blue copper proteins, vitamin B ₁₂ coenzymes, nitrogen fixation and iron-sulfur proteins, biological nitrogen fixation, nitrogenase and dinitrogen complexes, iron-sulfur proteins, synthetic analogues for Fe-S proteins, core extrusion reactions.	6 hr 6 hr

	<p>5. Metal transport and storage: A brief review of iron transport.</p> <p>6. Synthesis of simple ligands or isolation of S-containing amino acid or extraction of chlorophyll from green leaves (this will involve both collection of synthetic procedures from library, term paper presentation / discussion)</p>	
Pedagogy	Mainly lectures / tutorials / assignments /group discussion / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICO-502

Title of the Course: Catalysis: The Basic chemical concepts

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with Chemistry back ground are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To understand fundamentals concepts of chemical reactions over the catalysts.2. To understand energy saving and making green processes in chemical reactions.3. To understand fundamentals concepts of chemical reactions for developing higher productivity, mechanisms and viability.4. To provide knowledge on applications of heterogeneous, homogenous and other catalytic processes.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the green chemical processes.2. They will be well equipped with the knowledge of catalytic reactions.3. They will be in position to understand the reaction mechanism process.4. The concepts of catalytic reactions will be cleared to them.5. They will know the applications of catalyst compounds in chemical reactions and industries.	
Content:	<p>1. Origin and development of catalysis; Difference between heterogeneous, homogeneous, auto and photocatalysis, Importance of heterogeneous and homogeneous catalysts in chemical reactions.</p> <p>2. Heterogeneous Catalysis:</p> <ol style="list-style-type: none">i. Adsorptions: Physical and chemical adsorption, dissociative adsorptions, simple adsorptions isotherm, Langmuir adsorption and the BET adsorption isotherm.ii. Types of Catalysts; Preparations of the Catalysts, nano-materials, significance of zeolites and supported catalysts.iii. Characterization of solid catalysts: Surface area, structure and surface morphology, X-ray diffraction, SEM, TEM, X-ray absorption spectroscopy, XPS and Auger spectroscopy to surface studies.iv. Activity and life of the catalysts, active centers, promoters and poisons, catalyst deactivations.v. Heterogeneous reactions: Thermodynamic consideration in surface reactions, ammonia synthesis, oxidation reduction reactions (selected examples), mechanism of catalytic reactions, method of finding rate of the reactions and the rate determining steps.vi. Theories of Catalysis: Boundary layer theory, Catalysis by semiconductors, Wolkenstein theory, Balancing's approach,	<p>2 hr</p> <p>17 hr</p>

	<p>electronic factors is catalysis by metals.</p> <p>3. Homogeneous Catalysis: Intermediate stages in homogenous Catalysis, energy profile diagram, general scheme for calculating kinetics of reactions, decomposition of hydrogen peroxide, acid-base catalysis, hydrogenation, Mosanto acetic acid, Carboxylation reaction and Wacker reaction.</p> <p>4. Introduction to followings: Photocatalysis, catalytic polymerizations, phase transfer catalysis and biocatalysis with suitable examples.</p> <p>5. Catalysts for energy and environmental: Catalytic gasification, steam reforming, fuel cells and auto-industrial emission control.</p>	<p>7 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.	
Text books / Reference books	<ol style="list-style-type: none"> 1. P. H. Emmett, <i>Catalysis</i>, Vol I, Reinhold, New York, 1955. 2. A.V. Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICO-503

Title of the Course: Chemistry of P-Block Elements

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICO-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of P-Block Elements	No. of Lectures
Course Objective:	To provide basic and advanced knowledge about P-Block elements, their compounds and complexes.	
Course Outcome	This course will give sufficient information about the periodic table in general and P-Block elements and their compounds in particular.	
Content:	<p>1. General trends of different properties in groups and periods in periodic table</p> <p>2. Chemistry of Group 13 Elements and their Compound 2.1 Introduction, physical properties, chemical reactions with oxygen, nitrogen, sulphur, halogens, HCl, NaOH, NH₃, mono-di-tri-chlorides, alums, organo-compounds of B and Al, difference between boron and other Gr. 13 elements, diagonal relationship. 2.2 Preparation, bonding and structure of diborane, higher boranes, borane anions, carboranes and metallocarboranes.</p> <p>3. Chemistry of Group 14 Elements and their Compound 3.1 Introduction, physical properties, compound of Gr.14: Oxides, di & tetra halides, hydrides, sulphides, complexes of Gr. 14, organosilicon compounds (except silicones), cluster compounds of Ge, Sn and Pb. 3.2 Carbon dating, graphene, metallocarbohedrenes, freons.</p> <p>4. Chemistry of Group 15 Elements and their Compound 4.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides; 4.2 Preparation, properties and structure of Phosphorous: Oxides, oxyacids, sulphides, oxosulphides; organophosphorous compounds. 4.3 Classification, preparation, properties and structures of phosphazenes.</p> <p>5. Chemistry of Group 16 Elements and their Compound 5.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides, oxides (except sulphur), oxyacids (except sulphur), classification of oxides. 5.2 Polyatomic sulphur cations, anionic polysulphides, compounds with sulphur as a ligand.</p>	<p>2 hr</p> <p>9 hr</p> <p>5 hr</p> <p>5 hr</p> <p>6 hr</p>

	<p>6. Chemistry of Group 17 Elements and their Compound</p> <p>6.1 Introduction, physical properties; preparation, properties and structure of: Oxides, oxyacids, halides, oxohalides, hydrogenoxide fluorides and related compounds.</p> <p>6.2 Preparation, properties and structure of: Polyhalide anions, polyhalonium cations, halogen cations.</p> <p>7. Chemistry of Group 18 Elements and their Compound</p> <p>7.1 Introduction, physical properties; preparation, properties and structure of xenon compounds (fluorides and oxides); organoxenon compounds, coordination compounds.</p> <p>7.2 Preparation, properties and structure of compounds of other noble gases.</p>	<p>6 hr</p> <p>3 hr</p>
Pedagogy:	Mainly lectures/ tutorials/ assignments /seminars/ presentations/ self-study or a combination of some of these could be used to some extent. Sessions shall be fractionally interactive in nature.	
Text books: References/Readings:	<p>1. J. D. Lee, <i>Concise Inorganic Chemistry</i>, Blackwell Science Wiley, 2015, 5th Ed. (Reprint)</p> <p>2. P. W. Atkins, T. Overton, J. Rourke, M. Weller and F. Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-502

Title of the Course: Reaction Mechanisms, Stereochemistry and Asymmetric Synthesis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry at T Y B Sc (Chemistry) and M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction to important principles of stereochemistry such as Baldwin's rules.2. Understand the importance of chirality in organic syntheses.3. Learn about non-catalytic asymmetric synthesis methods in the classical chemistry involving alkenes and carbonyl compounds.4. Analyse and understand mechanistic aspects for fundamental reactions studied at TYBSc/ MSc Part I levels.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in position to understand the importance of asymmetric synthesis in organic reactions.2. Students should be in position to understand to apply various principles of stereochemistry and understand the mechanistic aspects of fundamental reactions.	
<u>Content:</u>	<p>I. Reaction Mechanisms-</p> <p>1. Intramolecular Reactions (Baldwin's Rules)</p> <p>2. Molecular rearrangements and their synthetic applications</p> <p>2.1 Unifying principles and mechanisms of rearrangements taking place at an electron deficient and electron rich substrates.</p> <p>2.2 Rearrangements taking place at carbon: Arndt Eistert, Wagner Meerwein, benzil-benzilic acid, Pinacol, semipinacol, Tiffeneau Demjanov, dienone phenol, Wittig, Favorskii, Stevens, Wolff, Baker-Venkatraman rearrangement, Barton decarboxylation, Pummerer rearrangement.</p> <p>2.3 Rearrangements at nitrogen: Hofmann, Curtius, Lossen, Schmidt, Beckmann, Neber, Stieglitz rearrangement.</p> <p>2.4 Rearrangements at oxygen: Payne (including aza and thia Payne) rearrangement, hydroperoxide rearrangement, Criegee rearrangement.</p> <p>2.5 Aromatic rearrangements: Benzidine, Fries, Von Richter, Sommelet-Hauser, Smile's, Jacobsen. Rearrangement on aniline derivatives- Bamberger rearrangement, Fischer-Hepp, Orton, Hofmann-Martius,</p>	<p>02 hours</p> <p>07 hours</p>

	<p>Reilly-Hickinbottom, rearrangements of N-aryldiazanilines, Phenylhydrazines, Phenylhydrazones.</p> <p>2.6 Rearrangements involving fragmentations: Eschenmoser fragmentation.</p> <p>II Stereochemistry</p> <p>1.1 Stereoselectivity in cyclic compounds</p> <p>(1) Introduction</p> <p>(2) Stereochemical control in six membered rings</p> <p>(3) Reactions on small rings</p> <p>(4) Regiochemical control in cyclohexene epoxides</p> <p>(5) Stereoselectivity in bicyclic compounds</p> <p>1.2 Conformations, stability and reactivity of fused ring compounds</p> <p>1.2.1 Fused bicyclic systems with small and medium rings:</p> <p>(1) Bicyclo [4.4.0] decanes (cis- and trans-decalins)</p> <p>(2) cis- and trans- decalones and decalols</p> <p>(3) Octahydronaphthalins (octalins)</p> <p>(4) Bicyclo [4.3.0] nonane (cis- and trans-hydrindanes)</p> <p>1.3 Fused polycyclic systems</p> <p>(1) Perhydrophenanthrenes</p> <p>(2) Perhydroanthracenes</p> <p>(3) Perhydrocyclopentenophenanthrene system (steroids, triterpenoids and hormones). Conformations and reactivity towards esterification, hydrolysis, chromium trioxide oxidation, ionic additions (of X_2) to double bonds, formation and opening of epoxide ring, epoxidation by peroxy acids.</p> <p>1.4 Spirocyclic compounds</p> <p>1.5 Reactions with cyclic intermediates or cyclic transition states</p> <p>2. Conformation of bridged ring compounds</p> <p>2.1 Bicyclo [2.2.1] heptane (norbornane)</p> <p>(1) Geometry and topic relationship of hydrogens.</p> <p>(2) Solvolysis of bicyclo[2.2.1]heptyl systems, formation, stability and reactivity of norbornylcation.</p> <p>(3) Relative stability and the rate of formation of <i>endo</i> and <i>exo</i> isomers in both bornane and norbornane systems.</p> <p>2.2 Bicyclo [2.2.2] octane system</p> <p>(1) Geometry and topic relationship of hydrogens</p> <p>(2) Solvolysis of bicyclo[2.2.2]octyl system.</p> <p>2.3 Other bridged ring systems: starting from bicyclo[1.1.1]pentane to bicyclo[3.3.3] undecane</p> <p>2.4 Bicyclo system with heteroatom: the relative stabilities of</p>	<p>8 hours</p> <p>4 hours</p>
--	---	-------------------------------

	<p>tropine, pseudotropine and benzoyl derivatives of norpseudotropine.</p> <p>3. Dynamic Stereochemistry: Stereoselective Reactions</p> <p>3.1 Stereoselectivity: classification, terminology and principle. Selectivity in chemistry– substrate and product selectivity.</p> <p>3.2 Stereoselective reaction of cyclic compounds: Introduction, reactions of four, five and six-membered rings. Conformational control in the formation of six-membered ring.</p> <p>3.3 Diastereoselectivity: Introduction, making single diastereoisomers using stereospecific reactions of alkenes.</p> <p>3.4 1,2-Addition to carbonyl compounds: Predicting various addition outcomes using different predictive models such as, Cram Chelate, Cornforth, Felkin-Anh. Specific reactions: allylation/crotylation by Brown, Roush, BINOL catalyzed.</p> <p>3.5 Stereoselective reaction of acyclic alkenes: The Houk model</p> <p>4. Asymmetric synthesis</p> <p>4.1 Chiral pool (chiron approach)</p> <p>4.2 Chiral auxiliary approach Oxazolidinone & norephedrine-derived chiral auxiliary controlled Diels-Alder reaction and alkylation of chiral enolates and aldol reaction, Alkylation using SAMP and RAMP</p> <p>4.3 Chiral Reagents (Use of (-)-sparteine)</p> <p>4.4 Asymmetric catalysis CBS catalyst, Ruthenium catalyzed chiral reductions of ketones, Catalytic asymmetric hydrogenation of alkenes, Asymmetric epoxidation (Sharpless and Jacobson), Sharpless asymmetric dihydroxylation reaction Organocatalysed aldol reaction (Use of proline)</p> <p>5. Stereoisomerism due to axial chirality, planar chirality and helicity.</p> <p>5.1 Stereochemistry and configurational (R/S) nomenclature in appropriately substituted allenes, alkylidenecycloalkenes, spiranes, adamantoids, biaryls, trans-cycloalkenes, cyclophanes and ansa compounds.</p> <p>5.2 Atropisomerism in biphenyls and bridged biphenyls.</p>	<p>6 hours</p> <p>6 hours</p> <p>3 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-503

Title of the Course: Synthetic Methods in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. Part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various concepts related to making carbon-carbon bonds.2. To understand designing of organic synthesis to make molecules of interest.3. To plan total synthesis based on protection-deprotection strategy.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how a carbon-carbon bond can be constructed.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<p>1. Formation & reactions of enols and enolates.</p> <p>1.1. Keto-enol tautomerism: introduction, acidity, basicity concepts & pKa scale, neutral nitrogen and oxygen bases. Formation of enols by proton transfer, requirements for and mechanism of enolisation 51pprox.51d by acids & bases, types of enols & enolates, kinetically & thermodynamically stable enols, consequences of enolisation, stable enolate equivalents, preparation and reactions of enol ethers.</p> <p>1.2. Formation of Enolates: Introduction, preparation & properties, non-nucleophilic bases, E / Z geometry in enolate formation, kinetic vs. thermodynamic control, other methods for the generation of enolates, issue of enolate ambidoselectivity.</p> <p>1.3. Alkylation of enolates: diverse reactivity of carbonyl groups, alkylation involving nitriles and nitroalkanes, choice of electrophile for alkylation, lithium enolates of carbonyl compounds and alkylation, specific enol equivalents to alkylate aldehydes and ketones, alkylation of β-dicarbonyl compounds, problem of regioselectivity during ketone alkylation and the remedy provided by enones.</p> <p>1.4. Reaction of enolates with aldehydes and ketones: introduction, aldol reaction including cross & intramolecular version, enolizable substrates which are not electrophilic in nature, controlling aldol reactions with specific enol equivalents, specific enol equivalents for carboxylic acids, aldehydes and ketones.</p> <p>1.5. Acylation at carbon: Introduction, the Claisen ester condensation (intramolecular and inter / crossed),</p>	18 hours

	<p>acylation of enolates by esters, preparation of keto-esters by the Claisen reaction, directed C-acylation of enols and enolates & acylation of enamines.</p> <p>1.6. Conjugate addition of enolates: Introduction, thermodynamic control vs. conjugate addition, utility of various electrophilic alkenes in conjugate addition, formation of six-membered rings <i>via</i> conjugate addition and nitroalkanes as versatile synthons.</p> <p>1.7. Examples pertaining to the application of following condensation reactions in organic synthesis: Mukaiyama reaction, Perkin reaction, Dieckmann condensation, Knoevenagel condensation & Doebner modification, Stobbe condensation, Darzen's glycidic ester condensation, Michael addition, Robinson annulation, and the Sakurai reaction.</p>	
	<p>2. Synthetic utility of the following name reactions / methodology with specific examples:</p> <p>2.1 Mannich Reaction, Nef Reaction, Mitsunobu and Appel Reaction, Baylis Hillman reaction, Mc. Murry coupling, vicarious nucleophilic substitution, Steglich and Yamaguchi esterification, Ring closing and cross metathesis: Grubb's various generation, Grubbs-Hoveya, Schrock catalysts- Scope and challenges in terms of ring sizes as well as FG tolerance.</p>	6 hours
	<p>3. The Ylids in Organic Synthesis.</p> <p>3.1. Phosphorus Ylids: Nomenclature and Preparation. Wittig olefination: mechanism, stereoselectivity, cis- and trans-selective reactions, Wittig reagents derived from α-halo carbonyl compounds,</p> <p>3.2 Modified Wittig, Horner – Wadsworth – Emmons, Stille-Gennari modification with achiral and chiral substrates, Peterson reaction, Julia Olefination.</p> <p>3.3. Sulfur Ylids: sulfonium & sulfoxonium ylids in synthesis, diphenylcyclopropyl sulfonium ylids & their reactions with carbonyl compounds / Michael acceptors.</p>	6 hours
	<p>4. Protecting Groups in Organic Synthesis.</p> <p>4.1. Introduction, when are Protecting Groups needed? Effective use of protective groups. Umpolung of reactivity & protecting groups.</p> <p>4.2. Common protective groups namely acetals & ketals, ditho acetal/ketals, trialkylsilyl, TBDMS, THP, -OMPM, MOM, MTM, MEM, SEM & benzyl ether, methyl ether, benzyl amine, Cbz, t-Boc, Fmoc, t-butyl ester and methods for deprotection. Examples of multistep synthesis using</p>	6 hours

	protection-deprotection procedures.	
Pedagogy:	Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-504

Title of the Course: Pericyclic and Organic Photochemical Reactions.

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses/topics in Synthetic Organic Chemistry & organic spectroscopy at M Sc Part-I level.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of various concepts in pericyclic chemistry based on molecular orbital theory.2. Introduction of analysis of pericyclic reactions using theoretical concepts.3. Learning mechanistic aspects of pericyclic & photochemical reactions in organic synthesis.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict course of given pericyclic reaction using the theoretical concepts.2. Students should be in a position to apply various to understand stereochemical output in a reaction.3. Students shall be in a position to understand/propose plausible mechanism of pericyclic/photochemical reactions.	
<u>Content:</u>	<p>1. Pericyclic Reactions Theory of pericyclic reactions- a) Frontier Molecular Orbital (FMO) theory b) Transition state aromaticity (Möbius-Hückel theory) concept c) Orbital correlation diagram method Analysis of pericyclic reactions (including stereochemistry) using the above concepts a) Cycloaddition reactions b) Electrocyclic reactions c) Sigmatropic rearrangements (Note: Various important features to be discussed taking examples of well-known reactions of each type) Some synthetically useful reactions (theory and examples) a) 1, 3-dipolar additions (Application of FMO theory and examples) b) [3, 3] Shifts; Claisen and Cope rearrangements and fluxional molecules, c) ene reaction, retro-Diels-Alder reactions.</p> <p>2. Organic Photochemistry a) Principles of energy transfer, theoretical concepts in organic photochemistry w. r. t.</p>	<p>24 hours</p> <p>12 hours</p>

	<p>cycloadditions, electrocyclic reactions etc.,</p> <p>b) Some photochemical reactions of alkenes, dienes, carbonyl compounds and arenes including the following- Cis-trans isomerization and photostationary equilibrium; Paterno-Buchi reaction ; Norrish Type cleavages; Di-pi methane rearrangement; bicycle rearrangement</p> <p>c) Reactions involving singlet and triplet oxygen</p>	
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-505

Title of the Course: Organic mixture separation and identification

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M. Sc. Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic separations.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Separation of organic components based on solubility. 2. Separation of organic components based on functionality. 3. Separation of organic components based on boiling points. 4. Distillation, recrystallization and derivatisation. 5. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.	
<u>Content:</u>	Three component mixture separation based upon differences in the physical and the chemical properties of the components. Elemental and functional group analysis and determination of physical constants of the individual compounds. Derivative preparation, its recrystallization and m. p. of each component and characterization of each component and its derivative by m. p. comparison. (Minimum 12 experiments of 6h each.) Assessment to be done through a 6hr examination comprising of an experiment emphasizing separation of mixture, elemental analysis of all three components and preparation of derivative of any one component suggested by examiner and recording of the physical constants and an oral assessment.	72 hours
<u>Pedagogy:</u>	Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-501

Title of the Course: Chemistry of Natural Products

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on stereochemistry, spectroscopy and synthetic organic chemistry at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	1. To study the main classes of natural products. 2. To understand the different methods that are used in natural product chemistry, including extraction, isolation and structural elucidation. 3. To understand the key biosynthetic pathways for the biosynthesis of terpenes, alkaloids and steroids.	
<u>Course Outcome</u>	3. Students should able to identify different types of natural products, their occurrence, structure biosynthesis and properties. 4. Students should able to carry out independent investigations of plant materials and natural products.	
<u>Content:</u>	1. General methods of purification and structure elucidation of Natural Products 1.1 General methods of isolation-The modern distillation process, maceration, enfleurage, extraction by cold pressing and extraction with solvents. 1.2 Fractionation of the crude extracts and purification of the individual compounds from the respective fractions using chemical and chromatographic techniques such as Column Chromatography, TLC, Preparative TLC, HPLC, etc. 1.3 Chemical methods based on the functional groups present. Bicarbonate extraction, sodium bisulphite adduct formation, derivatization, etc. 1.4 General approach to structure elucidation of the isolated pure compounds using UV, IR, NMR spectroscopy, MS spectrometry, optical polarimetry.	5 hours
	2. Structure elucidation by classical chemical methods 2.1 Terpenoids: α -cedrene 2.2 Alkaloids: Morphine, thebaine and codeine 2.3 Steroids: Cholesterol, bile acids	6 hours
	3. Structure elucidation by combination of chemical and spectral methods 3.1 Terpenoids: α - and β -vetivones, Ishwarone 3.2 Hormones: Cecropia Juvenile hormone, brevicomin and frontalinal 3.3 Oxygen heterocycles: Aflatoxin-B1, rotenone	8 hours

	4. Structure elucidation involving stereochemistry, spectral and Chemical methods 4.1 Terpenoids: Menthol and hardwickiic acid 4.2 Alkaloids: Reserpene	4 hours
	5. Synthesis of selected Natural Products, planning and execution 5.1 Terpenoids: Longifolene (E J Corey), Caryophyllene (E J Corey) Nootkatone (A Yoshikoshi), Menthol (Tagasago) 5.2 Alkaloids: Reserpine (R B Woodward), Morphine (Marshall Gates) 5.3 Hormones: Cecropia JH (Edward), Progesterone 5.4 Prostaglandins: Prostaglandin E ₂ (E J Corey) 5.5 Antibiotics: Cephalosporin (R B Woodward)	8 hours
	6. Biogenesis and biosynthesis of Natural Products 6.1 Terpenoids and Steroids: General approach towards biosynthesis of mono-, sesqui-, di-, tri-, tetraterpenoids and steroids through mevalonate pathway with special reference to the biosynthesis of terpenoids and steroids included in topics 3 to 6 6.2 Alkaloids: The shikimate pathway formation of hydroxybenzoic acid derivatives, aromatic amino acids, L-phenylalanine, L-tyrosine, phenolic oxidative coupling, biosynthesis of thebaine, codeine and morphine.	5 hours
<u>Pedagogy:</u>	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-503

Title of the Course: Introduction to Medicinal Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry and spectroscopy at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	4. Study of drugs and drug development. 5. Introduction to the concepts and processes of drug discovery, delivery, absorption and metabolism. 6. It also provides brief introduction to pharmacology, pharmacokinetics and pharmacodynamics.	
<u>Course Outcome</u>	1. Understand the historical and advanced concepts of medicinal chemistry and its advantages 2. Identify the medicinal properties of different organic molecules.	
<u>Content:</u>	1. Introduction to Drugs 1.1. Requirement of an ideal drug 1.2. Sources of drugs 1.3. Important terms used in chemistry of drugs 1.4. Classification and nomenclature of drugs	5 hours
	2. Drug Design 2.1. Analogues and pro-drugs 2.2. Concept of lead compounds 2.3. Features governing drug design – The method of variation, drug design through disjunction, conjunction, tailoring of drugs 2.4. Cimetidine – a rational approach to drug design.	5 hours
	3. Drug Development and drug action 3.1. Screening of natural products, isolation and purification, structure determination 3.2. Structure-activity relationship, QSAR, Synthetic analogues 3.3. Natural Products as leads for new pharmaceuticals 3.4. Receptor theories 3.5. Oxaminiquine – a case study. 3.6 Mechanism of drug action. 3.6. Introduction 3.7. Enzyme stimulation 3.8. Enzyme inhibition 3.9. Sulfonamides	8 hours
	4. Study of the following class of major drugs: 4.1. Pharmacodynamic Agents. a) Local anaesthetics b) Analgesics: Narcotic and non-steroidal anti-inflammatory,	8 hours

	<p>narcotic antagonists (Mechanism of Action and Synthesis of Ibuprofen)</p> <p>c) Antiepileptic drugs</p> <p>d) Antiparkinsonism drugs</p> <p>e) Antihistaminics (SAR and synthesis of chlorpheniramine) f) Sedatives and hypnotics (Mechanism of Action of and synthesis of Phenobarbital)</p> <p>g) Antipsychotics</p> <p>h) Cardiovascular agents: Cardiovascular diseases, Antianginal agents and vasodilators, Antihypertensive agents, Antiarrhythmic drugs, Adrenergic blocking agents (Mechanism of Action of Methyl Dopa and synthesis of Propranolol)</p> <p>i) Antihyperlipidemic and antiatherosclerotic agents</p> <p>j) Anticoagulants, blood coagulation and anticoagulant mechanism</p> <p>k) Diuretics</p> <p>l) Drugs and diabetes: Synthetic hypoglycemic agents.</p> <p>5.1 Chemotherapeutic Agents.</p> <p>a) Sulfonamides (Mechanism of Action of sulphonamides) b) Antitubercular and Antilepral agents (Mechanism of Action of p-Aminosalicylic acid and Dapsone) SAR of Dapsone</p> <p>c) Antiamoebics (Mechanism of Action of Metronidazole) d) Anthelmintics</p> <p>e) Antimalarials</p> <p>f) Antiviral agents</p> <p>g) Antineoplastic Agents</p> <p>Synthesis of Dapsone sulphacetamide Isoniazid Metronidazole</p> <p>5.2. Antibiotics : General information, mode of action and application of:</p> <p>a) β-Lactam antibiotics: Penicillins and Cephalosporins</p> <p>b) Aminoglycosides: Streptomycin, Neomycin</p> <p>c) Tetracyclines</p> <p>d) Macrolides: Erythromycin, Rifamycin</p> <p>e) Lincomycin</p> <p>f) Polypeptides: Bacitracin</p> <p>g) Unclassified antibiotic: Chloramphenicol (SAR and Synthesis)</p>	<p>4 hours</p> <p>6 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-504

Title of the Course: Retrosynthesis in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels and part II organic level CHOC-501, 502, 503 and 504 courses.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various logical steps related to planning of organic synthesis.2. To apprehend the complexity of synthesis of complex organic molecules.3. To apply the knowledge gained in organic synthesis for making new molecules.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how retrosynthesis can be used in finding out easily available chemical precursors for making organic molecules.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<ol style="list-style-type: none">1. Introduction to disconnection2. One-Group disconnection<ol style="list-style-type: none">2.1 Disconnection of simple alcohols2.2 Compounds derived from alcohols.2.3 Review problems.2.4 Disconnections of simple olefins2.5 Disconnection of aryl ketones2.6 Control2.7 Disconnection of simple ketones and acids2.8 Summary and revision3. Two-group disconnection<ol style="list-style-type: none">3.1 1,3-Dioxygenated Skeletons3.2 β-Hydroxy carbonyl compounds3.3 α,β-Unsaturated carbonyl compounds.3.4 Review problems3.5 1,5-Dicarbonyl compounds3.6 Mannich reaction3.7 Summary and revision4. 'Illogical' Two group disconnection<ol style="list-style-type: none">4.1 The 1,2-Dioxygenated Pattern<ol style="list-style-type: none">(a) α-Hydroxy carbonyl compounds.	<div>2 hours</div> <div>3 hours</div> <div>4 hours</div> <div>8 hours</div>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-505

Title of the Course: Heterocyclic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels, part II organic level CHOC-501, 502, 503 and 504 courses and must be simultaneously studying CHOO-503 and 504, courses.	
<u>Course Objective:</u>	1. Understand the fundamentals of heterocyclic chemistry 2. Knowledge of synthesis of heterocycles.	
<u>Course Outcome</u>	1. Understand the reactivity of heterocycles towards electrophilic, nucleophilic, reducing and oxidizing reagents. 2. Knowledge of synthesis of heterocycles.	
<u>Content:</u>	1. Introduction, classification and Nomenclature of mono- and bicyclic heteroaromatic molecules	04 hours
	2. Physical properties, dipole moment, acidity-basicity, Aromaticity electron density distribution and reactivity of- 2.1 Furan, Thiophene, Pyrrole, Indole 2.2 Pyridine, Pyridine-N-oxide 2.3 Quinoline and isoquinoline 2.4 Diazines and triazines 2.5. 1,3- and 1,2- azoles	20 hours
	3. Synthetic strategies based on retrosynthetic approach: General methods of synthesis of the following- 3.1 Furan, Thiophene, Pyrrole, Indole 3.2 Pyridine, Quinoline and isoquinoline 3.3 Chromones	12 hours
<u>Pedagogy:</u>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-506

Title of the Course: Introduction to Polymer Chemistry-I: Basic Concepts

Number of Credits: 03

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses in Organic Chemistry at T. Y. B Sc. and M. Sc. Part-I levels.	
<u>Course Objective:</u>	Introduction to various concepts in organic polymer chemistry.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the differences in structures and properties of small molecules and macromolecules.2. The students will be in a position to understand concepts involved in polymer synthesis and characterization.	
<u>Content:</u>	1. Brief history of natural and synthetic polymers: Classification & nomenclature of polymers, Functionality concept- linear, branched and cross-linked polymers. Introduction to biodegradable polymers.	07 hours
	2. Methods and Chemistry of polymerization: Bulk, solution, suspension, emulsion, addition, condensation polymerizations. Free-radical, Ionic and co-ordination polymerization reactions and copolymerization. Introduction to controlled free radical polymerization. Carothers equation in condensation polymerizations.	12 hours
	3. Some properties of polymers: Number and weight average molecular weights, Molecular weight distribution, polydispersity, Glassy state and glass transition temperature, crystallinity in polymers. Introduction to characterization of polymers.	10 hours
	4. Additives in polymers: Lubricants, plasticizers, stabilizers, antioxidant, fire retardants, blowing agents, fillers, colorants, crosslinking agents, UV-Vis degradants etc., (properties and examples)	07 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-507

Title of the Course: Introduction to Polymer Chemistry-II: Synthesis of Polymers and Processing

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the course entitled- Introduction to polymer Chemistry-I: Basic Concepts	
<u>Course Objective:</u>	Introduction to various concepts involved in the synthesis and processing of organic monomers and polymers.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the synthetic methodology and applications of various monomers and polymers.2. The students will be in a position to understand concepts involved in polymer processing.	
<u>Content:</u>	<ol style="list-style-type: none">1. Resources for monomers, manufacture of some important monomers and reagents: Ethylene, propylene, butadiene, isoprene, styrene, divinyl benzene, acrylates, acrylonitrile, vinyl chloride, formaldehyde, adipic acid, urea, bisphenol-A, melamine, terephthalic acid, phthalic anhydride, dimethyl terephthalate, glycol, glycerol, ethylene oxide, epichlorohydrin, ϵ-caprolactum, di-isocyanates, pentaerythritol, allylic carbonate monomers.	14 hours
	<ol style="list-style-type: none">2. Synthesis, properties and applications of certain polymers: Vinyl polymers- LDPE, HDPE, PVC, PVA, polyvinyl acetate, polyacrylates, methacrylates, polystyrene, teflon, ABS, SBR, SAN. Condensation polymers- Nylons, polyesters, polyurethanes, polycarbonates. Thermoset polycarbonates like CR-39 Cellulose esters- cellulose acetate, nitrates and acetate-butyrates. Natural rubber, Thermoset resins- phenol-formaldehyde, resols and novolacs, melamineformaldehyde, urea-formaldehyde, epoxy resins - their curing.	14 hours
	<ol style="list-style-type: none">3. Polymer processing – Introduction to compounding, and processing techniques like calendaring, casting, moulding and spinning in polymer processing.	08 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry)

Course Code: OCO-508

Title of the Course: Selected Experiments in Organic Chemistry-I

Number of Credits: 4

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M Sc Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Stoichiometric requirements during organic syntheses. 2. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents. 3. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of microwave, photochemistry, low temperature synthesis etc. 4. Use of organic spectroscopic techniques in monitoring the organic syntheses.	
<u>Content:</u>	(Group A: minimum 8 experiments) 1. Dimedone from mesityl oxide (Dieckmann condensation). 2. 1,2,3,4-tetrahydrocarbazole from cyclohexanone (Fisher indolisation reaction). 3. o-Chlorobenzylidene rhodanine (Perkin reaction). 4. Diels- Alder reaction of anthracene and maleic anhydride using microwave irradiation. 5. Oxidation of a primary / secondary alcohol to carbonyl compound by polymer supported chromic acid (Amberlyst A - 26, chromate form). 6. Phenytoin from benzil and urea. 7. Use of protecting groups: Synthesis of 1,1-diphenylbut-1-en-3-one 1) Ethyl acetoacetate ethylene acetal. 2) 1,1-Diphenyl -1-hydroxy-3- butanone ethylene acetal. 3) 1,1-Diphenyl -1-hydroxy- 3-butanone. 4) 1,1-Diphenylbut-1-en- 3 -one. 8. Isoborneol from camphor (NaBH ₄ reduction) 9. 3 -Methyl -2-phenyl-2-butanol from 2-bromopropane and acetophenone 10. Friedel- Crafts acylation of anisole.	48 hours

	<p>11. Diethyl 4- butyl malonate by malonic ester condensation</p> <p>(GROUP B: minimum 8 experiments)</p> <ol style="list-style-type: none"> 1. Epoxidation of cholesterol or related compounds 2. 2,2 - dichloro bicyclo (4.1.0) heptane from cyclohexene and dichloro cabene using PTC. 3. Reduction of Nitrobenzene to aniline by Sn / HCl. 4. 2 - methyl benzimidazole from o-phenylene diamine. 5. Benzophenone oxime to benzanilide (Beckmann rearrangement). 6. Ferric chloride oxidative coupling of 2-naphthol: 2,2'- dihydroxy dinaphthyl 7. Dicoumarol from coumarin derivative. 8. LAH reduction of Anthranilic acid. 9. Norborneol to norcamphor using chromiurn trioxide/sulfuric acid 10. Halogenation using NBS: preparation of 9-bromoanthracene (or benzylic bromides) 11. Benzhydrol from benzaldehyde (Grignard reaction) 12. Ethyl n-butyl acetoacetate by acetoacetic ester condensation <p>Note: Students are expected to use techniques like TLC, IR, GC for monitoring/ establishing purity, identity of the synthesized compounds.</p>	48 hours
<u>Pedagogy:</u>	<p>Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.</p> <p>The students are required to undertake pre-lab. and post – lab. assignment as instructed by the concerned teacher and the same may be evaluated by according suitable weightage as an ISA component while prescribing the mode of assessment.</p>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-509

Title of the Course: Chemistry of Life

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the basic of amino acid, fatty acid and types of carbohydrates at BSc (Chemistry)	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of types of amino acid and proteins2. Introduction of carbohydrates and lipids3. Understanding characteristics of proteins, carbohydrates & lipids and their applicability in daily life4. Understanding chemicals used in food production through food processing, storage and cooking.5. Understanding food analysis and the chemistry of the digestion of food and the energy provided by food.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict type of proteins, lipids and carbohydrates available in food.2. Students should be in a position to apply knowledge role of cooking in daily food.3. Students shall be in a position explore the chemical structure and functionality for the macronutrient categories like carbohydrates, lipids, and protein in food4. Student will be able to design experiments through an inquiry-oriented, food chemistry focused laboratory program.5. The students should be able to identify the essential chemical components of food and have knowledge of their analyses, gained a working knowledge of the chemistry of lipids, carbohydrates and proteins	
<u>Content:</u>	<p>1. Chemistry and Functionality of Proteins Major food proteins Structure, physical function in food Analysis: Proteins</p> <ol style="list-style-type: none">a) Introduction of amino acid and role of polar, non-polar, acidic and basic side chains and also their properties, and Isoelectric pointb) Introduction of peptide, dipeptides and proteins.c) Types of proteins (primary (1°), secondary (2°), tertiary, (3°) and Quaternary (4°)<ul style="list-style-type: none">• Hydrogen bonding between side chains• Salt Bridges between side chains• Hydrophobic - non-polar interactions• Disulfide linkaged) Protein folding, denaturation, functional properties of proteins.e) Food Proteins – Source of Nutrients and Analysis of proteins and amino acidsf) Other Methods used in the Study of Food Proteins <p>2. Chemistry and Functionality of Major Components of Food: Carbohydrates</p> <p>Introduction of Mono, di and oligosaccharides, starch, Dietary fibre and gums, their reactions and physical function in food and their analysis.</p>	<p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> a) Content in common foods b) Discuss Fischer projections, Haworth Projections, stereoisomerism c) Major reactions d) Sugars: Hydrolysis, thermal degradation, Maillard reaction (non-enzymic browning reaction between reducing carbohydrates and proteins) e) Starch retrogradation (staling of bread) f) Mutarotation g) Decomposition of sugars: Maillard Reaction (Maillard Browning), Amadori Rearrangement and Analysis of Sugars h) Discuss Fischer projections, Haworth Projections, stereoisomerism <p>3. Chemistry of Major Components of Food: Lipids</p> <ul style="list-style-type: none"> a) <i>Fats: Fats in nutrition to be discussed</i> b) <i>Classes of lipids, fatty acids,</i> c) <i>monoglycerides,</i> d) <i>diglycerides,</i> e) <i>triglycerides, polar</i> f) <i>lipids</i> g) <i>Reaction of fats- Oxidative and hydrolytic rancidity</i> h) <i>Analysis</i> i) <i>Fats in food- for e.g. Chocolate</i> j) Other Methods Used in the study of food lipids to be discussed 	12 hours

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Thermodynamics and Reaction Kinetics

Course Code: PCC-502

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce to classical & non-equilibrium thermodynamics. To introduce advances in reaction kinetics.	
Course Outcomes:	Students should be in a position to understand various concepts of thermodynamics and kinetics. Students should be in a position to apply the knowledge of thermodynamics and kinetics for their lab course in physical chemistry, dissertation and research work.	
Content:	2. Equilibrium Thermodynamics 1.1 Thermodynamic state functions. Exact and inexact differentials; partial derivatives. Maxwell relations. 1.2 Thermodynamic equations of state. Temperature and pressure dependence of Gibbs function. Gibbs-Helmholtz equation. Partial molar quantities. Free energy change accompanying a chemical reaction, chemical potential, Gibbs-Duhem equation. Duhem-Margules equation. 1.3 Entropy of mixing for gases and liquids. Gibbs paradox. 1.4 Thermodynamic derivation of phase rule.	9 hours
	2. Non-equilibrium Thermodynamics 2.1 Concept of internal entropy and spontaneity of a process in relation to free energy. Chemical affinity and extent of a reaction. Mass and energy balance equations. Entropy production in heat flow, chemical reactions and open system. 2.2 Postulates and methodologies, linear laws, Gibbs equations, Onsager's reciprocal theory. Validity of Onsager's equation and its verification. Application to thermo-electric and electro-kinetic phenomena.	9 hours
	3. Reaction Kinetics 3.1 Collision theory of reaction rates and treatment of unimolecular reactions. Theory of absolute reaction rates and its applications to reactions in solution. Thermodynamic study from reaction kinetics, comparison of results with Eyring and Arrhenius Equations. Solvent and salt effects; influence of ionic strength and solvent on the rates of reaction, primary and secondary salt effects. 3.2 Mechanism of photochemical, chain, coupled and Reversible reactions. Oscillatory reactions. Chemical Hysteresis in Belousov-Zhabotinskii reaction. 3.3 Fast reactions and study by stopped flow technique, relaxation method, pulse radiolysis, flash photolysis and magnetic resonance methods. 3.4 Homogeneous catalysis and Michaelis-Menten kinetics. Kinetic	18 hours

	<p>rate law for autocatalytic reactions. Kinetics of heterogeneous reactions, heterogeneous catalysis, inhibition, product induced and non-reactive inhibition.</p> <p>3.5 Potential energy surfaces and introduction to molecular reaction dynamics, theoretical calculation of energy of activation, chemical lasers.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<ol style="list-style-type: none"> 1. P.W. Atkins & J. De. Paulo, <i>Atkins' Physical Chemistry</i>, Oxford Univ. Press, 2007, 8th Ed. 2. J. Rajaram, J.C. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Electrochemistry and Surface Studies

Course Code: PCC-503

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce electrochemical processes such as ion-ion and ion solvent interactions. To introduce thermodynamics of electrochemical processes, kinetics of electrochemical reactions, electrochemistry of fuel cells, batteries and super capacitors.	
Course Outcomes:	Students should be in a position to understand various concepts of electrochemistry. Students should be in a position to apply the knowledge of electrochemistry for their dissertation and research work. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	3. Electrolyte Solutions 1.1 Ion-solvent interactions. Born Theory, validity and limitations. 1.2 Difference between solvation number and coordination number. 1.3 Ion-ion interactions and Debye-Huckel theory of ion cloud. 1.4 Concept of ionic strength and activity coefficient. 1.5 Debye-Huckel limiting law and its modifications. 1.6 Transport of ions in solution. Relaxation and Electrophoretic effects. 1.7 Debye-Huckel-Onsager equation, validity and limitations.	8 hours
	2. Electrified Interfaces 2.1 Formation of an electrified interface and its structure. 2.2 Polarizable and non-polarizable interfaces. 2.3 Concepts of outer potential, surface potential, inner potential and relationship between them, chemical and electrochemical potentials. 2.4 Concept of surface excess, Electro-capillary curves, Condition for thermodynamic equilibrium at electrified interface. 2.5 Generalized Gibbs equation, Lippmann equation and capacity of the double layer. 2.6 Models of the electrified interface. 2.7 Surface phase and Gibbs adsorption equation. Surface tension and adsorption on solid. Determination of surface excess.	8 hours
	3. Electrode Kinetics and Corrosion 3.1 Disturbance of electrode equilibrium, cause of electron transfer, fast and slow systems and their current-potential relationship. 3.2 Butler-Volmer equation and its low and high field approximations. 3.3 Nernst equation as a special case of B-V equation. 3.4 Tafel plots for anodic and cathodic processes. 3.5 Study of pH-potential diagrams.	8 hours

	<p>3.6 Pourbaix diagram for corrosion of iron.</p> <p>4. Colloids and Microemulsions.</p> <p>4.1 Charge and Stability of Sols. DLVO theory</p> <p>4.2 Electrokinetic phenomena: Electroosmosis, streaming potential and current, electrophoresis. Zeta potential.</p> <p>4.3 Donnan membrane equilibria.</p> <p>4.4 Micelles and reverse micelles: solubilisation, and bilayers.</p> <p>4.5 Microemulsions</p> <p>5. Electrochemical Energies</p> <p>5.1 Thermodynamics of electrochemical energy conversion.</p> <p>5.2 Batteries: basic principles; rating and shelf life. Zinc-manganese dioxide: Leclanche and alkaline batteries. Lithium ion batteries and recharge ability.</p> <p>5.3 Fuel cells: Principle of a hydrogen-oxygen fuel cell. Classification of fuel cell systems based on types of electrolytes/temperature. Direct methanol-polymer electrolyte fuel cell and electro-catalysts - a case study. Reactions occurring in various fuel cells and calculation of their electrode and cell potentials</p> <p>5.4 Super capacitors: Introduction: Origin of supercapacitance. Aqueous systems – ruthenium oxide/carbon with sulphuric acid and or solid polymer electrolytes.</p>	<p>6 hours</p> <p>6 hours</p>
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Group Theory and Spectroscopy

Course Code: PCC-504

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce concepts in Group Theory and its applications to chemistry. To introduce some advanced topics in spectroscopy.	
Course Outcomes:	Students should be in a position to understand various concepts of Group Theory. Should be able to apply character table to solve various problems. Students should be in a position to apply the knowledge of spectroscopy for their dissertation and research work.	
Content:	<p>4. Elements of Group Theory</p> <p>1.1 Symmetry elements and symmetry operations, Concept of group and group multiplication tables, order of the group, classes and subgroups in a group, Different types of groups (cyclic, abelian and non-abelian groups).</p> <p>1.2 Point groups, Matrix representations of a group, Reducible and Irreducible representations groups, Great Orthogonality Theorem, Properties of Irreducible representations, Mulliken symbols for Irreducible representations, Character tables.</p> <p>1.3 Standard reduction formula, Direct products of representations and its applications Quantum Chemistry and spectroscopy: Vanishing of integrals, Selection rules. Applications of group theory for hybridization of atomic orbitals. Projection operator and Symmetry adapted linear combinations (SALCs), MO treatment (within Huckel Molecular Orbital Theory) of large molecules with symmetry. Applications of group theory to Infra-red and Raman spectroscopy.</p> <p>2. Microwave, IR and Raman Spectroscopy</p> <p>2.1 Theoretical treatment of Rotational and Vibrational spectroscopy.</p> <p>2.2 Principle of Fourier Transform (FT) spectroscopy, FTIR spectroscopy Theory, instrumentation and applications.</p> <p>2.3 Quantum theory of Raman effect, Raman shift, Instrumentation, Resonance Raman spectroscopy, Complementary nature of IR and Raman spectroscopy in structure determination, Applications.</p> <p>3. NMR Spectroscopy</p> <p>3.1 Basic principles of NMR.</p> <p>3.2 Theory of pulse NMR and Fourier analysis, FT-NMR.</p> <p>3.3 Solid state NMR, magic angle spinning (MAS), dipolar decoupling and cross polarization, applications of solid state NMR.</p> <p>3.4 Double resonance, NOE, Spin tickling, Solvent and shift reagents, Structure determination by NMR.</p> <p>4. ESR Spectroscopy</p>	<p>18 hours</p> <p>6 hours</p> <p>8 hours</p> <p>4 hours</p>

	<p>4.1 Theory and experimental techniques, Identification of odd-electron species (methyl and ethyl free radicals) and radicals containing hetero atoms.</p> <p>4.2 Spin trapping and isotopic substitution, Spin densities and McConnell relationship, Double resonance techniques.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

	<ol style="list-style-type: none"> 1. To determine the partial molal volume of ethanol-water mixture at a given temperature 2. To study the phase rule for two component system 3. To determine the partial molal volume of sodium chloride-water, ethanol-water and methanol-water system (apparent molal volume method) 4. To determine the effect of salt on surface tension of water using by capillary rise method 5. To study effect of surfactants on surface tension of water using stalagmometer 6. To study the variation of viscosity with composition of mixtures and to verify the formation of compounds by Oswald's viscometer 7. To study the effect of pH on the kinetics of iodination of aniline 8. To study the kinetics of reaction between H_2O_2 and KI (clock reaction) 9. To study the kinetics of rapid reaction between bromine and iodine in aqueous media 10. To investigate the autocatalytic reaction between potassium permanganate and oxalic acid. 11. To study the electroless deposition of Ni on non-conductor substrate and to determine the rate of deposition 12. To study the acid and alkaline corrosion susceptibility of metal and to determine the rate of corrosion 13. To study the catalytic activity of three different metal oxides in heterogeneous systems with H_2O_2 decomposition reaction 14. To determine the molecular weight of a polymer by intrinsic viscosity method. <p>Group - C. Computers in Chemistry</p> <ol style="list-style-type: none"> 1. To generate a mark sheet to learn various features of spreadsheets (revision) 2. To generate a plot for a given function (like solutions of 1D box, harmonic oscillator, H-like atom wave functions, Gaussians distributions etc) (revisions) 3. To write a computer program to obtain equivalence point in pH-metry and potentiometric experiments (derivative method) 4. To write a computer program to find percent composition for various atoms of a given molecular formula 5. To write a computer program to obtain slope and intercept for linear data using least square fit method 6. To write a computer program to obtain center of mass of a given molecule and moment of inertia, hence obtain 	24 hr
--	--	-------

	<p>classification of the given molecule</p> <p>7. To write a computer program to find out various parameters for data analysis viz. minimum, maximum, average, standard deviation, variance, covariance, correlation coefficient, frequency distribution etc.</p> <p>8. To write a computer program to obtain thermodynamic probability.</p> <p>9. To write a computer program to obtain degeneracy of a given energy level for a particle in a cube.</p> <p>Note: A minimum of 4 experiments from each group A-C are to be carried out.</p>	
Pedagogy:	Practical / Hands on sessions will be conducted.	
Text Books / Reference Books	<ol style="list-style-type: none"> 1. A. Finlay & J.A. Kitchener, <i>Practical Physical Chemistry</i>, Longman Publisher, 1963. 2. A. M. Yadav, <i>Advance Practical Physical Chemistry</i>, Krishna Educational Publishers, 2014. 	

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course PCC 401, PCO 401 in M.Sc. I. so as to have basic knowledge of material chemistry and reaction kinetics.	
Course Objectives:	1. To introduce concepts of solid state science 2. To provide fundamental knowledge of solids, description of crystal chemistry and classification of crystal structure and significance of crystal defects. 3. To provide basic understanding of temperature dependence of crystal structure, phase modifications and its influence on magnetic and electric properties of solids	
Course Outcomes:	1. Students should be in a position to understand the concept of solid state synthesis. 2. Students should be able to identify different solids based on crystal structure 3. Students should be in a position to understand the significance of crystal structure and its modifications, so as to enhance the magnetic and electrical properties to suit energy applications.	
Content:	<p>1. Solid State: Introduction</p> <p>1.1 General Principles and experimental procedure. 1.2 Hydrothermal and thin film method in solid state synthesis 1.3 Kinetics of solid state reactions, ion exchange and intercalation reactions.</p> <p>2. Crystal Chemistry:</p> <p>2.1 Unit Cells, close packed structures-ccp and hcp. 2.2 Ionic structures and covalent networks. 2.3 Some important structure types – rock salt, zinc blende, wurtzite, nickel arsenide and rutile. 2.4 Factors that Influence Crystal Structures: valencies and coordination numbers. 2.5 Significance of radius ratio rule and non-bonding electron effects.</p> <p>3. Crystal Defects and non stoichiometry:</p> <p>3.1 Types of defects. Point defects and thermodynamics. 3.2 Colour Centres, vacancies and interstitials in non stoichiometric crystals. 3.3 Dislocations, mechanical properties and reactivity of solids.</p> <p>4. Symmetry, Point Groups and Space Groups:</p> <p>4.1 Symmetry, miller Indices, lattice planes, d-spacings and multiplicities 4.2 Representation of point groups and space groups</p> <p>5. Phase Diagrams and Phase Transitions</p> <p>5.1 Basic Concepts and definitions. 5.2 Three component condensed systems. Martensitic</p>	<p>5 hours</p> <p>10 hours</p> <p>5 hours</p> <p>4 hours</p> <p>4 hours</p>

	transformations. Order-disorder transitions. 6. Ionic Conductivity and Solid Electrolytes: 6.1 General Introduction 6.2 Conduction in NaCl and AgCl 6.3 DC and AC resistivity measurements 7. Electronic Properties and Band Theory 7.1 Electronic structure and band theory of solids. 7.2 Band structure of metals and semiconductors. 7.3 Magnetic properties of transition metal oxides and applications	4 hours 4 hours
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Chemistry)

Course Code: PCO-503

Title of the Course: Solid State Chemistry II: Characterization of solid materials

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course Solid State Chemistry I : Concepts and Application, so as to have basic knowledge of solids state chemistry.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none">1. To introduce solid state characterization methods and techniques.2. To provide fundamental knowledge of principles and instrumentation involved in selected techniques.3. To provide comparative evaluation of data obtained from various techniques and its use in elucidating the chemical and morphological structure of solid materials	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand the design of the instrumental techniques, data acquisition and storage.2. Students should be able to understand the fundamental principles governing the technique, data interpretation and analysis to elucidate structural information of solid materials3. Students should be in a position to understand and apply the concept learned to make the best choice of a characterization technique(s) for elucidation of unknown solids under investigation.	
Content:	<p>1. Thermal Analysis 1.1 Thermogravimetric analysis, Differential Thermal Analysis 1.2 Differential scanning calorimetry 1.3 Application to characterization of materials</p> <p>2. X – Ray Diffraction: 2.1 The powder X-ray diffraction experiment, instrumentation 2.2 Intensities: scattering of X-Rays and factors that affect intensities, powder x-ray pattern 2.3 Introduction to single crystal x-ray diffraction. 2.3 Applications of high temperature powder diffraction. 2.4 Identification of crystal phases and evaluation of lattice characteristics</p> <p>3. Microscopic Techniques 3.1 Introduction to Electron Microscopy: Generation of electron beam, elastic and inelastic scattering of electrons by atoms 3.2 Scanning Electron Microscopy (SEM): Instrumentation, optics, resolution and compositional imaging, acquisition and data storage. Preparation of specimen, crystallographic information from SEM and environmental scanning electron microscopy</p>	<p>5 hours</p> <p>10 hours</p> <p>6 hours</p>

	<p>3.3 High Resolution Transmission Electron Microscopy (HR-TEM): Instrumentation, contrast mechanism, high voltage and scanning transmission microscopy, preparation of specimen and data interpretation.</p> <p>4. Selected Spectroscopic Techniques</p> <p>4.1 Vibrational spectroscopy: IR and Raman spectroscopy, fundamental principle, instrumentation and design, applications to ferroelectric materials such as LiNbO_3 and LiTaO_3.</p> <p>4.2 Visible and UV spectroscopy of solids: Fundamental principle, diffuse reflectance measurement, instrumentation and design, structural studies of transition metal oxides, glass and laser materials.</p> <p>4.3 X ray Spectroscopy: XRF, XANES and EXAFS: Absorption coefficient, absorption edges, resonance emission, extended absorption and photoelectron scattering. Instrumentation and design, characterization of transition metal oxides.</p> <p>4.4 Mössbauer Spectroscopy: Mössbauer effect, recoil free absorption and emission in solids, isomer shift, quadrupole splitting, magnetic splitting, instrumentation and design, characterization of Iron compounds.</p>	15 hours
Pedagogy:	Mainly lectures, tutorials, assignments and presentations or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Chemistry)
Title of the Course: Colloids and Surface Science
Course Code: PCO-505
Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/ hours
Course Objectives:	To Introduce surface properties of materials and forces at different interfaces. To introduce the concept of micelles, microemulsions. To introduce different adsorption models.	
Course Outcomes:	Students should be in a position to understand surface phenomenon and properties of interfaces. Students should be in a position to understand electrochemical phenomenon at interfaces. Students should be in a position to apply these concepts during the lab course in physical chemistry	
Content:	<p>1. Liquid Surfaces and Interfaces 1.1 General Introduction. Microscopic picture of liquid surface. 1.2 Surface tension and its measurement. Curved liquid surfaces. 1.3 The Kelvin equation and capillary condensation. 1.4 Nucleation Theory. 1.5 The surface excess. Gibbs energy and surface tension. The surface tension of pure liquids. Gibbs adsorption isotherm.</p> <p>2. Electrokinetic Phenomena and Surface Forces 2.1 Electrocapillarity – theory and measurement. 2.2 Charged surfaces such as mercury, silver iodide and oxides. Measurement of surface charge densities. 2.3 Electrokinetic phenomena: concept of zeta potential. 2.4 Surface forces – Van der Waals forces between molecules. Surface energy and Hamaker constant. 2.5 Measurement of surface forces. The DLVO theory and beyond. 2.6 Contact angle and its measurements. The line tension. Wetting and wetting transitions.</p> <p>3. Solid Surfaces 3.1 Surface stress and surface tension. Determination of surface energy. Surface steps and defects 3.2 Solid – solid interfaces 3.3 Microscopy of Solid surfaces: Optical microscopy, Electron Microscopies, Scanning Probe Microscopy (STM, AFM). 3.4 Diffraction Methods.</p> <p>4. Adsorption 4.1 Types of adsorption and adsorption times. Classification of adsorption isotherms. 4.2 Thermodynamics of adsorption.</p>	<p>7 hr</p> <p>9 hr</p> <p>6 hr</p> <p>6 hr</p>

	<p>4.3 Adsorption Models. The potential theory of Polanyi. 4.4 Experimental aspects of adsorption from gas phase. 4.5 Adsorption on porous solids. 4.6 Adsorption from solution.</p> <p>5. Surfactants, Micelles, Emulsions and Thin films 5.1 Classification of surfactants. 5.2 Spherical micelles: cmc and influence of temperature. Thermodynamics of micellization. Structure of surfactant aggregates 5.3 Macroemulsions: properties, formation and stabilization. Evolution and aging. Coalescence and demulsification. 5.4 Microemulsions: size of droplets. Elastic properties of surfactant films. Factors influencing the structure of microemulsions.</p>	8 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Nanoscience: Concepts and Applications

Course Code: PCO-506

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/hours
Course Objectives:	1. Introduction of various concepts for nanoscience. 2. Introduction of various synthesis methods of nanomaterials. 3. Introduction of various characterisation techniques and application study of nanomaterials	
Course Outcomes:	Students will learn different techniques of synthesis and characterisation of nanomaterials. Students should be in a position to understand magnetic, electrical, optical and catalytic properties of materials at nanoscale level. Students should be in a position to apply the knowledge of subject for their dissertation and research work.	
Content:	1. Essential concepts and definitions Nanoscale, interdisciplinary nature of nanoscience, quantum effects, colours from colloidal gold, Surface to volume ratio of nanoparticles, surface effects and surface energy on nanoparticle surface. 2. Electronic and Electrical properties Chemistry of solid surfaces, Zero dimensional systems: nanoparticles One dimensional systems: nanowires and nanorods Metallic nanowires and quantum conductance. 3. Fabrication of nanoscale materials: top-down vs bottom-up approach i. Physical nanofabrication methods for the two dimensional nanostructures such as Thin film deposition of metallic copper, aluminium, tungsten and semiconducting silicon and Gallium arsenide films; Epitaxial growth; chemical vapour deposition and molecular beam epitaxial methods for the synthesis of semiconducting thin films, ii. Plasma Lithographic, photolithography, e-beam lithographic techniques for the transfer of circuit and nanopatterns on thin films. Positive and negative photoresists, different etching methods for the final pattern transfer on thin films. iii. Synthesis of colloidal metallic nanoparticles using different stabilizing and complexing agents such as citric acid and use of surfactants. iv. Discussion of Self assembly growth modes for thin films and colloidal nanoparticles : Stransky-Krastinova and Ostwald ripening	5 hr 5 hr 8 hr

	<p>4. Investigation of important nanomaterials:</p> <p>Silica: discussion of sol-gel and liquid crystal synthesis method, self assembly of colloidal silica particles, photoluminescence property of opals, different surface functionalization methods and application study</p> <p>Gold: Different colloidal synthesis methods, self assembly methods, surface Plasmon resonance (SPR) of colloidal gold nanoparticles surface functionalization strategies and application study</p> <p>CdSe: Different synthesis methods, synthesis of coreshell particles, Study of CdSe excitons and CdSe quantum dots, functionalization and application study.</p> <p>Iron oxide, Different synthesis methods Superparamagnetism property of nanoparticles, Hysteresis and magnetisation of Fe₃O₄ nanomaterial, catalytic and Biomedical applications.</p> <p>Carbon: synthesis methods for carbon nanotubes, Graphene and Buckminster fullerene, structural study of these materials, electrical property study of these materials, surface functionalization strategies and application study</p>	10 hr
	<p>5. Characterisation of nanomaterials</p> <p>i. Beam probe methods: Instrumentation, physical principle and different modes of operations in electron microscopic techniques such as Transmission electron microscope Scanning electron microscope and <i>Energy-dispersive X-ray spectroscopy</i>.</p> <p>ii. Electron and Scanning probe methods: Instrumentation, physical principle and different modes of operations in scanning tunnelling microscopy (STM) and Atomic force microscopy.</p> <p>iii. Optical Microscopes: Instrumentation, physical principle and different modes of operations in <i>Stimulated emission depletion (STED) microscopy</i> STED, Single molecule microscopy and <i>Dynamic light scattering (DLS)</i> is a technique.</p>	4 hr
	<p>6. Applications of nanomaterials</p> <p>Polymer vesicles for drug delivery, interaction of nanoparticles with DNA, Biosensors, Heterogeneous catalysts for the synthesis of fine chemicals, use of nano TiO₂ and ZnO for water and air pollution control.</p>	4 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

M Sc-II Pharmaceutical Chemistry
Semester III and IV Courses (Academic year 2019-2020 onwards)

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits
HCC-501	Pharmaceutical Chemistry II	3	HCO-501	Pharmacological and Toxicological Screening Techniques	3
HCC-502	Drug Product Formulation And Development	3	HCO-502	Calibration and Validation	3
HCC-503	Drug Design And Development	3	HCO-503	Polymers in Pharmaceuticals and novel drug delivery systems	3
HCC-504	Drug Quality And Regulatory Affairs	3	HCO-504	Biopharmaceutics	3
HCC-505	Laboratory Course In Pharmaceutical Chemistry	3	HCO-505	Pharmaceutical Technology	3
			HCO-506	Pharmaceutical Stability	3
			HCO-507	Laboratory Course in Natural Product Analysis	3
			HCO-508	Laboratory Course in Drug Product Formulation and Development	4
			HCO-509	Laboratory Course in Drug Design, Molecular Docking and Patents	2
			HCO-510	Laboratory Course in Quality Control and Quality Assurance	4

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-501

Title of the Course: Pharmaceutical Chemistry II

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the course in Pharmaceutical Chemistry at T Y B Sc level.	
<u>Course Objective:</u>	To learn major classes of drugs and understand its SAR and Mechanism of action.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to identify the examples in different classes of drugs• Students should be able to write IUPAC names and Structure of drugs.• Students shall be in a position to understand the mechanism of action of selected classes of drugs.• The students will have a clear understanding of concepts on SAR analysis.• The students will be able to apply synthetic organic chemistry knowledge in devising a synthesis for a drug.	
<u>Content:</u>	<p>1. Cholinergic and Adrenergic Agents, General Anaesthetics and Hypotensive agents Drugs acting on cholinergic nervous system: Bethanechol, Methacholine\$, Neostigmine, Pyridostigmine, Parathion, Malathion, Atropine, Dicyclomine\$, Tropicamide\$, Papaverine, Drugs acting on adrenergic nervous system: Methyldopa (MA,\$), Guanethidine, Ephedrine, amphetamine, Tranylcypromine, Pragyline, Norepinephrine, Epinephrine, Pronetalol, Propanalol\$, Atenolol\$, Metoprolol. General Anaesthetics: Ether, Nitrous oxide, Halothane\$, Ultra short acting Barbiturates-Thiopental sodium \$. Hypotensive agents acting on vascular smooth muscles: Nitrites, Amyl nitrites, Glyceryl nitrite\$, Pentaerythritol tetranitrate, Isosorbide dinitrate.</p> <p>2. Drugs acting on the central nervous system: Hypnotics and sedatives: Chloral hydrate, Phenobarbital\$, Secobarbital, Thiopental\$, Nitrazepam, Drugs acting as anticonvulsants: Phenytoin\$, phenacemide, Clonazepam, Phensuximide, Phenobarbital, (Classification of Barbiturates), Primidone, Carbamazepine\$. Psychotherapeutic agents: Phenothiazines such as Chlorpromazine, Chlorodiazepoxide\$, Oxazepam, Diazepam, Imipramine, Nialamide, Tranylcypromine, Pargyline. CNS stimulants: Phenmetrazine, Nikethamide\$, Iproniazid, PicROTOXINES, Tetrazole, Amphetamine.</p> <p>3. Antihistaminics, antiemetic, antiulcer drugs, Drugs used parkinsonism and Alzhemeier's Diphenhydramine, Triprolidine, Cyclizine, Promethazine\$, Cimetidine, Omeprazole (MA),Ranitidine, Sumatriptan, Ondisiton.</p>	<p>10 hours</p> <p>10 hours</p> <p>05 hours</p>

	<p>Drugs used in Parkinsonism: Benztropine mesylate, Levodopa, Carbidopa, Amantadine hydrochloride. Drugs for Alzheimer's diseases: Serin, Velnacrine, Aniracetam.</p> <p>4. Cardiovascular drugs, antihypertensive agents, and antibiotics: Digitoxin, Quinidine, Procainamide, Verapamil. Antihypertensive agents which elicit their action through autonomous nervous system previously described under 1 and 2, clonidine, hydralazine, ACE inhibitors- Enalapril and related drugs vasodilators such as Nitroglycerine, Isosuprine, Nylidrin, Antibiotics: Penicillin and semisynthetic penicillins and Cephalosporins, Amoxicillin, Cloxacillin, Streptomycin, Chloromphenicol, Tetracycline and derivatives, Erythromycin.</p> <p>5. Analgesics, Antipyretics and Inflammatory agents: Analgesics, antipyretics and anti-inflammatory agents: Aspirin\$, Sodium salicylate, Acetaminophen\$, Phenacetin, Phenylbutazone, Oxyphenbutazone, Ibuprofen\$, Naproxen\$, Probenacid, Allopurinol, Profen, Diclofenac \$. Narcotic analgesic agents: Morphine, Codeine, Levarphanol, Meperidine, Methadone, Dextropropoxyphene. Non-narcotic analgesic agents: Dextropropoxyphene morphine antagonist n-allyl-nor morphine, Levallorphan.</p> <p>Note: \$- Synthesis to be studied.</p>	<p>05 hours</p> <p>06 hours</p>
Pedagogy:	Mainly Lectures & tutorials. Seminars/ assignments/ presentations/ self-study/group discussion or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-502

Title of the Course: Drug Product Formulation and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on drug formulations	
<u>Course Objective:</u>	To understand the concept of drug dosage forms types of formulations and pilot plant process. To study the drug formulation development with specific examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">Students should be able to formulate drugsStudents should be able to apply this knowledge for formulation experiments in laboratory.	
<u>Content:</u>	1. Introduction and Classification: Introduction to drugs, Dosage Forms & Drug Delivery system – Definitions of Common terms. Drug Regulation and control, pharmacopoeias-formularies, sources of drug, drug nomenclature, routes of administration of drugs products, need for a dosage form, classification of dosage forms & brief description, study of excipients.	08 hours
	2. Drug Product Development Preformulation studies, objectives, factors to be considered, study protocol. Brief discussion on various parameters to be investigated. formulation and development of the dosage form/drug delivery system-general consideration.	08 hours
	3. Pilot plant Scale up techniques, Benefits of pilot plant- Broad guidelines of process development. General Consideration. Industrial manufacturing method and flow charts of sulphamethoxazole, Rifampicin, Chloramphenicol maleate.	08 hours
	4. Pharmaceutical manufacturing operations Brief discussion on unit operations and types of equipments/ machines used. Unit operations like size reduction, mixing/blending, drying, compression etc.	06 hours
	5. Dosage forms-formulation components, manufacturing and QC Liquids-monophase & biophase including ENT preparation. Semisolid e.g. Ointment, creams, gels etc. Solid dosage forms, e.g. Tablets, capsules, granules & powders. Sterile dosage forms, e.g. Injectables and ophthalmic preparations.	06 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations will be acquired methods for learning.	
<u>References/Readings</u>	1. Allen Popovich & Ansel, <i>Ansel's Pharmaceutical Dosage forms and Drug Delivery System</i> , B.I. Publication Pvt . Ltd, 2005,

--	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-503

Title of the Course: Drug Design and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of the concept of drug design and the need for it.	
<u>Course Objective:</u>	To make the students well versed with theories of drug action. To make the students understand the Structure Activity Relationship studies with respect to various examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to explain the theories of drug action.• Students should be able to apply Quantitative Structure Activity Relationship knowledge in drug designing• Students should be able to analyze the effect of different functional groups on the biological activity of drugs• The students will have a clear understanding of concepts on SAR analysis.• The students should be able to illustrate an example of drug designing by molecular modeling.• The students will be able to understand the terms in patents.	
<u>Content:</u>	1. Introduction to Drug design, Lead compounds and Pro-Drug Concept. Development of new drugs: Introduction, procedure followed in drug design, the search for lead compounds, molecular modification of lead compounds, prodrugs and soft drugs, prodrug; introduction, prodrug formation of compounds containing various chemical groups, multiple prodrug formation, soft drugs; design of soft drugs.	08 hours
	2. SAR and QSAR Studies in drug discovery Structure-Activity Relationship (SAR): Factors effecting bioactivity, resonance, inductive effect, isoterism, bioisosterism, spatial considerations, biological properties of simple functional groups. 4-5 illustrative examples depicting structural activity relationship studies. Theories of drug activity, occupancy theory, rate theory, induced-fit theory. Quantitative structure-activity relationship (QSAR): history and development of QSAR, drug receptor interactions, the additivity of group contributions, physico-chemical parameters, lipophilicity parameters, electronic parameter, ionization constants, steric parameters, chelation parameters, redox potential, indicator-variables, quantitative models.	08 hours
	3. QSAR Approaches in drug designing and modern methods in discovery Hansch analysis- Advantages and drawbacks. Free-Wilson	08 hours

	<p>analysis, Advantages and drawbacks. Their application, relationship between Hansch and Free-Wilson analysis (the mixed approach), non-linear relationship, Introduction to other QSAR approaches- Free Topliss Method-Postulates and Illustration. Introduction to molecular modeling using computers and docking, uses of molecular modeling manual use, further computer programming.</p> <p>4. Designing of Enzyme Inhibitors Structure-based drug design: Process of structure based drug design, deactivation of certain drugs necessary for T cell functioning, determination of the active site with special reference to chymotrypsin, design of inhibitors. Design of Enzyme Inhibitors, 9-alkylpurines, 9-mercaptopurines and allopurines, active site directed irreversible enzyme inhibition, suicide enzyme inactivators.</p> <p>5. Development of New drugs High throughput screening. Drug Design softwares and its applications. Intellectual property rights, patents, industrial designs, geographical indications, trademarks, trade secrets. Patentable inventions. Patentable drugs. Role of patents in Pharmaceutical industry. trade related aspects (TRIPS), international & regional agreements. Examples of new drugs developed.</p>	<p>06 hours</p> <p>06 hours</p>
Pedagogy:	Lectures assignments presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-505

Title of the Course: Laboratory Course in Pharmaceutical Chemistry

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have undergone practical course in pharmaceutical chemistry at TYBSc. Level.	
<u>Course Objective:</u>	To apply the theoretical knowledge of pharmaceutical chemistry for synthesis.	
<u>Course Outcome</u>	A Student should be able to apply synthetic organic chemistry knowledge for synthesis of drug like compounds.	
<u>Content:</u>	1. Methods for synthesis of pharmaceutical compounds. a) Acetylation of p-aminophenol to acetanilide b) Esterification of salicylic acid c) Benzoylation of alanine/L-Cysteine d) Diazotisation of m-nitroaniline and coupling to give azo dye e) Schiff bases from 2-aminophenol and p-bromobenzaldehyde f) Sulphonylation of aniline/phenol	16 hours
	2. Synthesis of bioactive heterocycles a) 2-Methyl Benzimidazole from o-phenylene diamine b) 2,3-DiphenylQuinoxaline from Benzil c) Dilantin from Benzil and urea d) 7-Hydroxycoumarin from ethylacetoacetate e) Barbiturate from diethyl-n-butylmalonate f) Flavone from 2-hydroxyacetophenone g) Benzoxazole from 2-aminophenol h) Synthesis of Phenothiazine derivative	36 hours
	3. Synthesis of medicinal compounds a) Synthesis of Propranolol from α -Naphthol b) Synthesis of Sorbic acid from crotonaldehyde c) Synthesis of Dichloramine-T and Chloramine-T d) Synthesis of Eosin from Fluorescein e) Synthesis of Gramine from Indole	20 hours

<u>Pedagogy:</u>	Laboratory work well understood by pre-lab and post-lab assignments.	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. K.A. Connors, <i>Text book of Pharmaceutical analysis</i>, Wiley Interscience Publication 1990, 3rd Ed. 2. J. Bassett, J. Kar, <i>Advanced Practical Medicinal Chemistry</i>, New Age International Limited Publishers, 2004 	

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-501

Title of the Course: Pharmacological and Toxicological Screening Techniques

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of Biological Chemistry	
<u>Course Objective:</u>	To learn screening methods of biological Assay. To learn terms involved in Toxicology. To learn methods of analysis for Toxicology.	
<u>Course Outcome</u>	A student will be able to apply the role of various screening methods in bioassay. A student will be able to create various in vivo and in vitro assay methods for various targets. A student will be able to evaluate various effects of toxicology.	
<u>Content:</u>	1. Principles of Biological Standardisation, Screening methods Statistical treatment of model problems in evaluation of drugs-methods of biological assay, principles of biological assays-methods used in bioassay of vitamins, hormones, vaccines, cardiac drugs and other pharmacopoeial preparations. Organisation of Screening for the pharmacological activity of new substances. Anti-inflammatory agents-carrageenan induced paw oedema, cotton pellet method. Anticonvulsants: Convulsions induced by chemicals, induced by electroshock, combined procedures. Sympatomimetic agents: Mydriasis, the uterus and ascending colon of the rat.	12 hours
	2. Introduction to Toxicology: Definition and types of toxicology, Basic principles of toxicology, Carcinogenicity, mutagenicity, teratogenicity, acute, sub acute and chronic toxicity. Detailed toxicity(mild/moderate/severe toxicity wherever applicable) and treatment of drugs such as salicylates/ paracetamol, opium, quinine, ethyl alcohol, etc. Toxic chemicals in the environment, impact of toxic chemicals on enzymes. Biochemical effects of arsenic, lead mercury, cadmium, carbon monoxide, pesticides and carcinogens.	12 hours
	3. Essentials of Analytical Toxicology Physicochemical, biochemical & genetic basis of toxicity; Principles of toxicokinetics, mutagenesis and carcinogenesis – Behavioural, inhalation toxicity, hypersensitivity and immune response, range finding tests – Acute, subacute and chronic toxicity studies. Classification of Toxins: Acute toxicity tests, Determination of LD ₅₀ value, Subacute tests - Histopathological and biochemical estimations on toxicity induced in animal models – Modern methods of analysis for Toxins-Barbiturate poisoning, Amphetamine poisoning.	12 hours

<u>Pedagogy:</u>	Lectures, assignments, presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-502

Title of the Course: Calibration and Validation

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied practical course involving calibration of analytical instruments	
<u>Course Objective:</u>	To learn principles of calibration and validation of analytical instruments. To learn validation procedures for analytical instruments. To learn qualification of various analytical instruments.	
<u>Course Outcome</u>	A student will be able to apply calibration techniques to analytical instruments. A student will be able to validate analytical instruments. A student will be able to evaluate qualifications of analytical instruments.	
<u>Content:</u>	1. Calibration and Validation of Analytical Instruments Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Regulatory requirements for analytical method validation. International conference on harmonization (ICH) guideline Q2A:	12 hours
	2. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	12 hours
	3. Qualification of analytical instruments Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and field visits will be the acquired methods for learning.	
<u>References/Readings</u>	1. WHO guidelines (2014-2018) 2. Michael E. Swartz, <i>Analytical Method Development & Validation</i> , CRC Press, 1997. 3. Loftus & Nash, <i>Pharmaceutical Process Validation</i> , Dekker Incorporated, Marcel, 1984.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-503

Title of the Course: Polymers in Pharmaceuticals and novel drug delivery systems

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the topic on polymers in the TYBSc. Level	
<u>Course Objective:</u>	To learn classification synthesis and properties of polymers. To learn the role of polymers in drug delivery systems. To learn new innovations in drug delivery systems.	
<u>Course Outcome</u>	A student will be able to identify the type of polymers that can be used for drug delivery systems. A student will be able to get the knowledge of innovative drug delivery systems and apply it for their lab project.	
<u>Content:</u>	1. Introduction and Types of Polymers in Pharmaceuticals Classification, General methods of synthesis, properties, characterization and evaluation: Biodegradable polymers - Classification - Mechanism of biodegradation in the body. Polymer processing with respect to novel formulation design: Applications of polymers in novel drug delivery systems. Introduction to Novel Drug delivery systems, drug delivery carriers, routes of administration.	12 hours
	2. Polymers as Novel Drug Delivery systems Recent advances in drug delivery systems. Theory of controlled release drug delivery systems. Microencapsulation – Methods of encapsulation. Transdermal drug delivery systems – Theory, formulation, production and evaluation. Targeted drug delivery systems – concept of drug targeting, importance in therapeutics.	12 hours
	3. Recent Innovations in drug delivery systems Recent innovations in conventional dosage form like tablets, capsules, sterile dosage forms, pellets, Mucoadhesive system, GRDDS, peptide drug delivery, supercritical fluid technique, PEGylation, Nanoparticulate drug delivery. Future opportunities and challenges.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and mini-projects will be the acquired methods for learning.

----------------------------	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-504

Title of the Course: Biopharmaceutics

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the concepts of drug metabolism at T Y B Sc level.	
<u>Course Objective:</u>	To learn ADMET. Drug absorption drug distribution Drug Action Drug metabolism and excretion To learn how bioavailability is important understanding the efficacy of a drug product.	
<u>Course Outcome</u>	A student will be able to relate drug absorption to bioavailability. A student will be able to get an in-depth knowledge of drug metabolism concept.	
<u>Content:</u>	1. Drug absorption, Dissolution and Distribution Based on cell membrane Gastro-intestinal absorption of drugs, mechanisms of drug absorption, factors affecting drug absorption: Biological, physiological, physico-chemical and pharmaceutical. Noyes-Whitney's dissolution rate law, study of various approaches to improve dissolution of poorly soluble drugs, In-vitro dissolution testing models, In-vitro-in-Vivo correlation. Factors affecting drug distribution, volume of distribution, protein binding – factors affecting, significance and kinetics of protein binding.	12 hours
	2. Drug Metabolism and Excretion Metabolism of drugs, Xenobiotics, Drug metabolizing organs and enzymes (microsomal & nonmicrosomal), Chemical pathways - Phase I reactions (Oxidative, reductive and hydrolytic reactions) and Phase II reactions (Conjugation), Significance of cytochrome P ₄₅₀ oxidation – reduction cycle, Factors affecting biotransformation of drugs. Renal excretion – Glomerular filtration, Active tubular secretion, Active (or) passive tubular reabsorption. Factors affecting renal excretions of drugs. Non renal excretions – Biliary, pulmonary, salivary, mammary, skin/dermal, gastrointestinal and genital excretions of drugs (Any two types)	12 hours
	3. Bioavailability and Bioequivalency studies Objectives and considerations in bioavailability studies, Concept of equivalents, Measurements of bioavailability, Determination of the rate of absorption, Bioequivalence studies and its importance,. Biopharmaceutical classification of drugs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-505

Title of the Course: Pharmaceutical Technology

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on pharmaceutical technology.	
<u>Course Objective:</u>	To learn unit processes involving various chemical reactions. To learn industrial synthesis of selected list of drugs. To learn the need for pilot plant in industry and also the flowchart on various manufacturing methods of drugs.	
<u>Course Outcome</u>	A student will be able to explain unit processes for various chemical reactions. A student will be able to apply industrial synthesis knowledge for the synthesis of drug like molecules in laboratory. A student will be able to apply the knowledge of effluent treatment methods.	
<u>Content:</u>	1. Unit Processes Concept of unit processes in systematization of chemical reactions, explanation of one example each for unit processes: Alkylation, amination, (by ammonolysis, reduction), carbonylation, carboxylation, condensation, dehydration, diazotization, disproportionation, esterification, halogenation, hydration, hydroformylation, hydrogenation, hydrolysis, hydroxylation, nitration, oxidation and reduction. 2. Industrial Synthesis Introduction to pharmaceutical manufacturing – raw materials, detailed manufacturing procedure, therapeutic function, common name, chemical name, structural formulae of the following drugs :Acyclovir, alprazolam, propranolol, naproxen, ibuprofen, aspirin, levodopa and cimetidine. Lidocaine, ethambutal hydrochloride, 5-fluorouracil, amoxycillin sodium. 3. Process Development & Process Optimization a) Pilot- plant – Introduction – Appraisal for the need of pilot – plant – pilot plant (Vs) Small scale plant – Benefits of Pilot plant – Broad guidelines of process development. b) Industrial manufacturing method and flow charts of Sulphamethoxazole, Ciprofloxacin, and Rifampicin. Environment Health & Safety: Introduction to industrial effluents. Classification of effluents. Classification of basic methods of purifying effluents.	12 hours 12 hours 12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-506

Title of the Course: Pharmaceutical Stability

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied some knowledge on stability of drugs	
<u>Course Objective:</u>	To learn to predict shelf life and half life of pharmaceutical formulations. To learn various stability protocols and also stability terminologies as given in ICH guidelines I To learn ICH guideline II that is thorough investigation into stability labs.	
<u>Course Outcome</u>	A student will be able to explain fundamentals of stability studies. A student will be able to determine stability requirements for OTC drug products. A student will be able to make a stability labs ready for FDA inspection.	
<u>Content:</u>	1. Fundamentals of Stability Basic concept and objectives of stability study. Fundamentals of stability testing requirements. Order of reaction and their applications in predicting shelf life and half-life of Pharmaceutical formulations.	12 hours
	2. ICH Guidelines-I Review ICH process and ICH updates on stability Common terminology and acronyms. Review current Q1A, Q1B, Q1D, Q1F, Q2, Q3 and Q6 guidelines Determine stability requirements for OTC products Stability SOPs Stability protocols and data Design of a compliant bracketing and matrixing.	12 hours
	3. ICH Guidelines-II ICH guidelines on bracketing and matrixing Stability testing laboratory Design and validation stability test procedures Stability data management system Investigation procedures of OOS stability results FDA inspection of stability labs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group project will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-507

Title of the Course: Laboratory Course in Natural Product Analysis

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the theory topics in natural products at TYBSc. Level.	
<u>Course Objective:</u>	To introduce the practical component in natural product analysis. To learn various methods involved in the analysis of natural products.	
<u>Course Outcome</u>	A student will be able to Isolate natural products. A student will be able to synthesize natural products. A student will be able to characterize natural products by physical methods of analysis.	
<u>Content:</u>	<ol style="list-style-type: none">1) Isolation of Caffeine from tea, coffee etc. and purification by microscale sublimation. Characterization of pure caffeine by IR.2) Isolation of Cinnamaldehyde from Cinnamon by microscale steam distillation. Characterization and interpretation of isolated Cinnamaldehyde by IR.3) Enzymatic reduction of ethylacetoacetate using Baker's yeast.4) Thin layer Chromatography for separation of mixtures of natural products/Market Formulations.5) Column chromatography of two component mixture of natural products/Market Formulations.6) Conversion of camphene to isobornyl acetate7) Hydrolysis of isobornyl acetate to isoborneol8) Oxidation of isoborneol to Camphor.9) Transformation of Benzaldehyde to Benzoin using thiamine B12 as a coenzyme.10) Isolation of cholesterol from gallstones11) Determination of Acid Value of Fixed Oil.12) Determination of Saponification Value of Fixed Oil.13) Determination of Eugenol in Clove Oil.14) Qualitative analysis of natural products (Comprises of amino acids, carbohydrates, proteins, alkaloids, glycosides, steriods, flavonoids)15) Isolation of piperine from black pepper powder. Characterization and interpretation of isolated Cinnamaldehyde by IR.16) Isolation of calcium citrate from lemon juice.	48 hours
<u>Pedagogy:</u>	Laboratory work.. pre-lab and post-lab exercises mini-projects will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-509

Title of the Course: Laboratory Course in Drug Design, Molecular Docking and Patents

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of structure drawing at T Y B Sc level.	
<u>Course Objective:</u>	To learn drug designing through drug discovery experiments (drug simulations) To learn to use molecular docking software packages. To learn about patenting in pharmaceuticals.	
<u>Course Outcome</u>	A student will be able to synthesize drug molecules carry out in vitro bioassay and drug simulation studies. A student will be able use various molecular docking softwares for designing certain drug targets. A student will be able to know the procedure to pharmaceutical patent can be filed.	
<u>Content:</u>	1) Drug Design and Discovery experiments 1. Synthesis of Aspirin and Oil of Winter green and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 2. Synthesis of Sulphacetamide and Sulphamethoxazole and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 3. Synthesis of acetanilide and paracetamol and its physical properties, <i>in vitro</i> biological assays and drug simulation studies.	16 hours
	2) Molecular Docking Experiments Use of software packages in chemistry for the following: To write a computer program to obtain a slope and intercept for linear data using least square fit. 1. Use of ChemDraw, ISISDraw for drawing structures, chemical reactions, equations. 2. Molecular docking softwares such as Hex software or autodocking. 3. Energy minimization of molecules and finding intermolecular interactions of small molecule with macromolecule such as inhibitor, thymidilate synthase, glycogen synthase, E.Coli protease. 4. Viewing Tools and Graphics Tools • Rasmol (http://www.umass.edu/microbio/rasmol/) • VMD (http://www.ks.uiuc.edu/Research/vmd/) • Molscrip (http://www.avatar.se/molscrip/) 6. The use of molecular dynamics techniques for drug discovery using NAMD (http://www.ks.uiuc.edu/Research/namd/). Tutorials are at http://www.ks.uiuc.edu/Training/Tutorials/ . 7. Docking of small molecules to protein targets using Autodock	24 hours

	<p>(http://autodock.scripps.edu/). Tutorials are at http://autodock.scripps.edu/faqshelp/tutorial/using-autodock-4-with-autodocktools.</p> <p>3) Patents</p> <ul style="list-style-type: none"> i) Prior Art Search on Target Drug (Any 2) ii) Patent Filing procedures (Any two case studies) 	8 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-510

Title of the Course: Laboratory Course in Quality Control and Quality Assurance

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the analysis of pharmaceuticals at TYBSc. Level.	
<u>Course Objective:</u>	To learn quality control analysis of drugs using analytical instruments. To learn to perform quality assurance experiments	
<u>Course Outcome</u>	A student will be able to use UV spectrophotometer dissolution apparatus high performance liquid chromatograph (HPLC) and Infra Red spectrophotometer. For quality control analysis of drugs. A student will be able to perform quality assurance experiments.	
<u>Content:</u>	I) Quality Control Analysis Experiments Spectrophotometric Analysis 1) Determination of % purity of a given sample of Chloramphenicol capsules IP. 2) Determination of % purity of a given sample of Furosemide injection IP. 3) Determination of % purity of a given sample of Allopurinol tablets IP. 4) Determination of % purity of a given sample of Propranolol HCl tablets IP.	16 hours
	Dissolution Analysis (Any 2) 1) Dissolution rate study of sustained release Theophylline tablets IP. 2) Dissolution rate study of sustained release Diclofenac tablets IP. 3) Analysis of Diclofenac sodium and paracetamol in combined dosage form.	12 hours
	Chromatographic Techniques in Pharmaceuticals: 1) To identify the given drug amongst the paracetamol, aspirin and caffeine citrate with the help of thin layer chromatography and calculate its <i>R_f</i> value. 2) To identify the given sulpha drug among the sulphadiazine, sulphamethoxazole and trimethoprim with the help of thin layer chromatography and calculate its <i>R_f</i> value. 3) To perform the Separation of amino acids by paper chromatography. 4) To identify the given sample of sugar with the help of ascending paper chromatography and calculate its <i>R_f</i> value. 5) To demonstrate high Performance liquid chromatography and analyse Diazepam Tablets by High Pressure Liquid Chromatography.	24 hours

	6) To develop and validate the analytical method of any one drug using high performance liquid chromatography. 7) To analyze the given tablets of paracetamol/ibuprofen-paracetamol combination HPTLC method. 8) Separation of mixture of o-nitroaniline and p-nitroaniline using column chromatography. Infrared Spectroscopic analysis Demonstration of Instrumentation and Interpretation of Representative Spectra a) To differentiate between analgesic-NSAIDs :Aspirin, Ibuprofen, Paracetamol. b) To differentiate between Acetophenone, p-Nitroacetophenone, Benzamide. c) To interpret the I.R. spectra of the following compounds: Benzyl alcohol, Benzaldehyde, Acetanilide, Ethylacetate, Ethyl methyl ketone, m-nitroaniline.	8 hours
	II) Quality Assurance Experiments (Any 9) 1) Evaluation of Riboflavin/Ibuprofen tablets I .P. to characterize and evaluate the effect of different concentrations of binders and disintegrant. 2) Design and fabrication of theophylline sustained release formulation and comparison of its release profile with the conventional dosage form. 3) Formulation and evaluation of micronized disperse system for parenteral delivery of drugs including test for pyrogens and sterility testing etc. 4) Preparation of solid dispersions of poorly water soluble drugs using different carriers and to study the release profile and compare with conventional dosage forms. 5) Disintegration and dissolution of per oral tablets. 6) Influence of vehicle on drug availability from topical dosage forms in-vitro. 7) Design and preparation of a suspension and its evaluation. 8) Development of moisture resistant coating formulation for Amoxicillin tablets/ Ranitidine tablets. 9) Quality control of paper, Plastic and glass container. 10)Quality control of labels and label adhesives. 11)Microbial limit test in oral products. 12)Validation of sterilization equipments e.g. Hot air oven, Autoclave. 13)Validation of Analytical procedure.	36 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations and case studies will be given to students.

Programme: M. Sc. Part-II (Chemistry)

Course Code: CGO-501

Title of the Course: Selected Experiments in Chemistry

Number of Credits: 8

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the theory and practical courses in Analytical, Inorganic, Organic and Physical Chemistry at MSc-I level so as to have basic knowledge of experiments in chemistry.	
Course Objectives:	<p><i>This course is in lieu of Dissertation (8 credits) and is to be opted by those students who are not opting the dissertation at part-II level. Consequently, the course will be taught over two semesters (III and IV, 4 credits in each semester). The objectives and outcomes are thus defined considering the requirements of experimental Analytical, Inorganic, Organic and Physical Chemistry.</i></p> <ol style="list-style-type: none">1. Introduction of various instrumental techniques for analysis.2. Learning data analysis, handling and interpretation of spectra.3. To learn techniques of crystallization of ligands and synthesis of coordination compounds.4. To learn characterization of compounds using different instruments.5. To introduce analysis of ores for metal content.6. To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.7. To train the students in application of theoretical concepts related to organic spectroscopy by interpreting various spectra (UV, IR, NMR, Mass, 2D NMR etc.) of organic compounds.8. To impart experimental knowledge regarding computational and theoretical concepts in physical chemistry.9. To introduce synthesis methods of nanomaterials and nanoporous materials.10. To introduce computational techniques in physical chemistry.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to use different instruments for qualitative and quantitative analysis.2. To gain experience with some statistics to analyse data in lab.3. Students will be able to understand the methods of syntheses and characterization of coordination compounds4. Students will be in a position to synthesis, characterize and measure the solid state properties of oxide materials.5. Students shall gain the understanding of:<ol style="list-style-type: none">i. Stoichiometric requirements during organic syntheses.ii. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.iii. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of	

	<p>microwave, photochemistry, low temperature synthesis etc.</p> <p>iv. Use of organic spectroscopic techniques in monitoring the organic syntheses.</p> <p>6. Students should be in a position to understand mathematical and theoretical methods in chemistry.</p> <p>7. Students will be able to understand different methods for syntheses and characterization of nanomaterials and nanoporous materials.</p> <p>8. Students will understand the concepts of phase rule and adsorption.</p>	
Content:	<p>Unit-I: Analytical Chemistry- Instrumental methods of analysis. (Minimum 08 experiments to be performed.)</p> <ol style="list-style-type: none"> Potentiometric determination of dissociation constant of Cu-ammonia complex. Potentiometric titration of Zn^{2+} against $[\text{Fe}(\text{CN})_6]^{4-}$ and determination of the empirical formula of the complex formed. To record and interpret the cyclic voltammogram for potassium ferricyanide $[\text{K}_3\text{Fe}(\text{CN})_6]$ Kinetic investigation for $\text{Fe}^{2+}/\text{Fe}^{3+}$ system using cyclic voltammetry To study the fluorescence spectroscopy by recording spectra for following compounds (Quinine sulphate and Anthracene) and compare the data of two compounds Quantitative determination of amount of anthracene/quinine sulphate using fluorescence spectroscopy Fractionation (based on polarity) of given mixture by Solvent extraction protocol followed by recovery of separated analyte using rotary evaporator and determination of purity by TLC analysis Separation of a mixture of o- and p- nitro anilines on an alumina column chromatography and recovery, reuse of mobile phase using rotary evaporator. Calibration of IR spectrophotometer using polystyrene film and to check the performance of the instrument. Estimation of aspirin and caffeine from APC tablet by UV-Visible spectrophotometry. <p>Unit-II: Inorganic Chemistry</p> <p>Group-1: Preparation of ligands (including distillation/ recrystallization) / metal-ligand compounds / inorganic compounds / crystal structure analysis: (Any 4 experiments)</p> <ol style="list-style-type: none"> Preparation of Schiff base and characterization. Preparation of substituted benzoic acids and characterization. Preparation of acetylacetonate complexes of Co(II) and Co(III) and estimation of cobalt. Preparation of a polyoxometallate and characterization Preparation of aluminium(III)tris(acetylacetonate) and estimation of aluminium. Preparation of potassium dihydroxodioxalatotitanate(IV) and estimation of titanium. 	<p>48 hours</p> <p>24 Hours</p>

	<ul style="list-style-type: none"> ii. Benzidine from hydrazobenzene (benzidine rearrangement). iii. Methyl orange/red from sulphanilic acid/anthranilic acid (diazotization). iv. Benzil to hydrobenzoin (NaBH_4 reduction). v. Photochemical transformation of benzophenone to Benzpinacol. vi. 2-(4-Methyl benzoyl) benzoic acid from phthalic anhydride and toluene (F-C reaction). vii. 2-(4-Methyl benzoyl) benzoic acid to methyl anthraquinone (PPA cyclisation). viii. Resolution of racemic phenyl ethylamine using tartaric acid. ix. Trans-Stilbene by Wittig reaction. x. Enamine alkylation :2- methyl cyclohexanone pyrrolidine enamine with CH_3I. <p>Unit IV: Physical Chemistry</p> <p>I. Computational Chemistry (Any Three Experiments.)</p> <ul style="list-style-type: none"> 1. Plotting various types of graphs viz. straight lines, exponential, Gaussians, orbitals, first and second derivative plots. 2. Working with molecular coordinates: Distance matrix, center of mass, bond angles, dihedral angles, bond lengths, moment of inertia. 3. Electronic Structure of Diborane using the nwchem default density functional and basis sets. 4. Vibrational Spectroscopy of Transition Metal Nitrosyls complexes using ab initio calculations. <p>II. Experimental physical chemistry (Any Five Experiments)</p> <ul style="list-style-type: none"> 1. Preparation of a transition metal oxide (ZnO / NiO) by three different precursors and their characterization by IR and XRD. 2. Synthesis of a photo catalyst (TiO_2 / ZnO) by two different precursors and study kinetics of adsorption and photocatalytic degradation of a suitable azo dye as pollutant. 3. Adsorption studies on the porous adsorbents and fitting the adsorption data using Freundlich and Langmuir adsorption isotherms. 4. To study the thermodynamics of the adsorption process and to determine thermodynamic parameters such as ΔS and ΔG of the adsorption process. 5. Synthesis of spherical and rod shaped colloidal silver nanoparticles and to perform stability and surface plasmon resonance (SPR) analysis using UV-vis spectrophotometer. 6. To study the three component system such as chloroform, acetic acid and water and to obtain tie lines and plait point. Plotting the composition of mixture on a ternary phase diagram. 	<p>18 hrs</p> <p>30 hrs</p>
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Note: The course would be taught over entire academic year with practicals from any two specializations in odd semester (III) and remaining two in the even (IV) semester. The ISA and SEA would be conducted in each of the semesters and final marks will be computed only at the end of even semester. Thus, students opting the course will be divided in to four batches and two of them together will undertake practicals in two specializations in one semester and remaining two in the next semester.

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the spectroscopic techniques such as UV-Vis, IR at FY B Sc, S Y B Sc or T Y B Sc levels so as to have basic knowledge of spectroscopy and basic principles.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction of various concepts in molecular and atomic spectroscopy. 2. Learning data analysis, handling and interpretation of spectra 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to use spectroscopic methods for qualitative and quantitative analysis. 2. Evaluate the utility of UV/Vis spectroscopy as a qualitative and quantitative method. 3. Identification of functional group based on IR spectra 4. Students should be in a position to predict the structure based on IR, NMR, MS data. 	
Content:	<p>1.Introduction to spectrochemical methods</p> <p>1.1. Interaction of Electromagnetic Radiation with Matter: electromagnetic spectra, Regions of Spectrum; Numericals.</p> <p>1.2 Electronic spectra and Molecular structure: kinds of transition, Chromophores and auxochrome; absorption by isolated chromophores, conjugated chromophores, aromatic compounds, inorganic chelates.</p> <p>1.3. Infrared absorption and molecular structures: IR spectra, overtones and bands-basis of NIR absorption</p> <p>1.4. Spectral Databases: Identification of unknown; Application of UV-Vis and IR spectroscopy for identification of unknown compounds</p> <p>1.5. Solvents for spectrometry: Choices and effect of solvents on UV-Vis and IR spectra.</p> <p>1.6. Quantitative Calculations: The Lambert-Beer's Law; Mixtures of absorbing species-laws of additivity of absorbance; calibration curve for calculation of unknown; Spectrometric errors in measurement; Deviation from Lambert-Beer's law-chemical deviation, instrumental deviation; Quantitative measurement from IR spectra; Numericals for quantitative analysis using UV-VIS spectroscopy.</p> <p>1.7. Spectrometric Instrumentation of UV-Vis and IR (brief introduction only): Sources, monochromators, sample cells, Types of instruments; detectors; Instrumental wavelength and absorption calibration. (Chapter 16: Analytical Chemistry, G.D. Christian, 6thEd.)</p> <p>2. Molecular Luminescence: Fluorimetry, Phosphorimetry and Raman Spectroscopy</p> <p>2.1. Introduction,</p> <p>2.2. Fluorimetry : Theory and basic principle; Quenching; Spectrofluorimeters and applications</p> <p>2.3. Phosphorimetry: Theory and basic principle; phosphorimeters and application</p> <p>2.4. Raman Spectroscopy: Theory and Structural analysis using Raman Spectra (Chapter 6: Instrumental Methods of Chemical Analysis, G.W. Ewing, 5thEd)</p> <p>3. Atomic Spectroscopy</p> <p>3.1. Principles of emission</p> <p>3.2. Atomic Emission spectroscopy (AES)</p> <p>3.3. Flame Emission spectroscopy (FES)</p>	<p>12 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>3.4. Atomic absorption Spectroscopy (AAS) 3.5. X-Ray Fluorescence Spectroscopy (XRF) (Introduction, principles and applications of above techniques shall be discussed; Chapter 13: Analytical Chemistry Principles, J.H. Kennedy, 2nded)</p> <p>4.Spectrometric Identification of Organic compounds 4.1 Ultraviolet and visible Spectroscopy : Brief Revision of UV/VIS Spectroscopy ;Instrumentation and Sampling ; Applications of Electronic Spectroscopy:Conjugated Dienes, Trienes, polyenes, α, βunsaturated carbonyl compounds, aromatic hydrocarbons (Assignment based on BSc. Syllabus for calculating λ_{max}) (Kemp – Chap4) 4.2 Infrared Spectroscopy: Introduction to IR spectroscopy; Basic IR spectra interpretation; Frequencies of functional group. (Kemp – Chap2). 4.3 Proton and Carbon NMR Spectroscopy: Theory of NMR ; Chemical shift; factors influencing chemical shift ; Solvents used in NMR; Theory of spin-spin splitting and simple spin systems;Coupling constant calculation; Factors influencing coupling constant (Assignment based on BSc. Syllabus) (Kemp - Chapter 3) 4.4 Mass Spectrometry : Basic PrinciplesandInstrumentation: Problem solving in structure elucidation based on MS (Kemp - Chapter 5) 4.5. Conjoint Spectrometry Problems: Structural elucidation of organic molecules using UV, IR, NMR (1H, ^{13}C), MS, (Silverstein)</p> <p>(Note:Assignment based on BSc. syllabus for all above spectrometric structure should be given to student. <i>More weightage of lectures shall be given for solving IR and NMR data for structur elucidation</i>)</p>	14 hr
Pedagogy:	Mainly lectures and tutorials. Seminars / term papers /assignments / presentations / self-study or a combination of some of these can also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACC-402

Title of the Course: Laboratory Course in Analytical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied practical chemistry courses at F.Y B.Sc, S.Y. B .Sc & T Y B Sc levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	Introduction of various experimental techniques for analysis. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	Students should be in a position to use standardized material to determine an unknown concentration. To gain experience with some statistics to analyse data in laboratory Students should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p><i>This course consists of 6 units of experiments in various areas of Analytical chemistry. Minimum 12 experiments shall be carried out and at least 02 experiment from each unit shall be conducted.</i></p> <p>UNIT 1: STATISTICS 1.Calibration of apparatus (balance, volumetric flasks, pipettes and burettes) and preparation of standard solutions and standardisation</p> <p>UNIT 2: COLORIMETRY AND UV-VISIBLE SPECTROPHOTOMETRY 2.Estimation of Iron from Pharmaceutical sample (capsule) by thiocyanate method 3. Estimation of lead/nitrate in water sample 4. Estimation of KNO_3 by UV spectroscopy and $\text{K}_2\text{Cr}_2\text{O}_7$ by Visible spectroscopy 5. Simultaneous determination and Verification of law of additivity of absorbances ($\text{K}_2\text{Cr}_2\text{O}_7$ and KMnO_4) 6.Estimation of phosphoric acid in cola drinks by molybdenum blue method</p> <p>UNIT 3: FLAME SPECTROPHOTOMETRY 7.Estimation of Na 8.Estimation of K or Ca</p> <p>UNIT 4: VOLUMETRY 9.Estimation of Ca in pharmaceutical tablet. 10.Estimation of Al and/or Mg in antacid tablet</p> <p>UNIT 5: ION EXCHANGE CHROMATOGRAPHY & SOLVENT EXTRACT ION 11.Separation and Estimation of Zn and Cd 12.Separation and Estimation of chloride and bromide 13.Extraction of Cu as copper dithiocarbamate (DTC) using solvent extraction and estimation by spectrophotometry</p>	

	UNIT 6: INTERPRETATION EXERCISES 14. Thermal studies: TGDTA and Isothermal weight loss studies of various hydrated solids like $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{Ca}_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$, $\text{Fe}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ 15. X-ray powder diffractometry: Calculation of lattice parameters from X-ray powder pattern of cubic system such as NiMn_2O_4 , CoFe_2O_4 etc.	
Pedagogy:	Prelab exercises / assignments / presentations / lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACO-401

Title of the Course: Analytical Techniques

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different analytical techniques used for qualitative, quantitative estimation	
Course Outcomes:	3. Students should be in a position to understand principle behind different analytical techniques 4. With the knowledge basic techniques used for qualitative and quantitative estimation students should be in a position to choose for appropriate technique for particular analysis 5. Students should be in a position to select the separation techniques for purification of analytes.	
Content:	<p style="text-align: center;">Section A</p> <p>1 Analytical Objectives, Data Handling and Good Laboratory Practice (GLP) Scope of analytical science and its literature, qualitative and quantitative analysis, ways to express accuracy and precision, types of errors and their causes; significant figures, control charts, confidence limit, test of significance, rejection of a result- the Q-test. Introduction to significant analytical procedure such as GLP- standard operating procedures, quality assurance, quality control and analytical method validation.</p> <p>2 Sampling and Calibration Methods Sampling and sample preparation, general steps in chemical analysis, calibration of glass wares. Finding the best straight line-least square regression, correlation coefficient; Calibration curves, standard addition technique and internal standards. Chemical concentrations.</p> <p>3 Electroanalytical techniques Introduction to electroanalytical techniques, electrochemical cells, electrode potentials, voltammetry and polarography, cyclic voltammetry, coulometry, controlled potential coulometry and coulometric titrations, Stripping voltammetry, ion-selective electrodes and sensors; Evaluation and Calculation; Application to Inorganic and Organic Trace analysis</p> <p style="text-align: center;">Section B</p> <p>1. Extraction Techniques Liquid-liquid extraction/solvent extraction: partition coefficient, distribution ratio and percent extraction; choice of solvents; Solvent extraction of metal ions-ion association complexes and metal chelates; multiple batch extraction, Craig's counter-current distribution; Introduction to green analytical extraction methods: Supercritical Fluid Extraction (SFE); Pressurized Liquid Extraction (PLE); Ultrasound Assisted Extraction (UAE); Microwave Assisted Extraction (MAE);</p>	<p>7 hr</p> <p>5 hr</p> <p>6 hr</p> <p>4 hr</p>

	<p>Enzyme Assisted Extraction (EAE); Solid Phase Microextraction (SPME); Solid Phase Extraction (SPE)</p> <p>2. Basic Principles in Chromatographic Methods Principles of chromatography, classification of chromatographic techniques based on mechanism of retention, configuration, mobile and stationary phase. Efficiency of separation- plate theory (theoretical plate concept) and rate theory (Van Deemter equation). Principles and applications of Paper chromatography, thin layer chromatography, HPTLC, Size exclusion and Ion exchange chromatography. Counter-current chromatography for isolation of natural products.</p> <p>3. Gas and Liquid Chromatography Introduction; Instrumental Modules; The Separation System; Choice of Conditions of Analysis; Sample Inlet Systems; Detectors; Practical Considerations in Qualitative and Quantitative Analysis; Coupled Systems-introduction to GCMS, LCMS; Applicability-interpretation and numerical problems; Recent and Future Developments</p> <p>4. Radioanalytical techniques Theory and principles of radio analytical technique, detection of nuclear radiation, radiation detectors, pulse height analysis, counting error, analytical application of radioisotopes, neutron activation analysis and isotope dilution analysis.</p>	<p>4 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / presentations/ self-study or a combination of some of these can also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Title of the Course: General Inorganic Chemistry

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in Chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.BSc. levels so as to have basic knowledge of Inorganic Chemistry and basic principles.	No. of lectures
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce atomic / molecular structure and symmetry. 2. To provide fundamental knowledge of solid state chemistry. 3. To introduce basic aspects of coordination / organometallic / bioinorganic chemistry. 4. To provide the concepts of acids and bases. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand atomic and molecular structure and the importance of symmetry. 2. Students should be able to understand molecular shapes. 3. Students should be in a position to understand concepts in i) solid state chemistry, ii) coordination chemistry, iii) organometallic chemistry, iv) bioinorganic chemistry. 	
Content:	<p>1. Atomic structure, molecular structure and bonding</p> <p>1.1 Atomic Structure: Structures of hydrogenic atoms: some principles of quantum mechanics. Many electron atoms: penetration & shielding, building up principle, classification of elements. spectroscopic terms. Atomic/ionic radii, ionization energy, electron affinity, electronegativity, polarizability.</p> <p>1.2 Molecular Structure & bonding: Lewis structures, VSEPR model, the basic shapes. Valence bond theory: the hydrogen molecule, homonuclear diatomic & polyatomic molecules; hybridisation. molecular orbital theory: approximation, bonding & antibonding orbitals. Homonuclear diatomic & Heteronuclear diatomic molecules.</p> <p>2. Molecular Symmetry:</p> <p>2.1 Symmetry elements</p> <p>2.2 Symmetry operations, equivalent symmetry elements and equivalent atoms, symmetry point groups with examples, point groups of higher symmetry, systematic procedure for symmetry classification of molecules and illustrative examples,</p> <p>2.3 Dipole moment, optical activity and point groups.</p> <p>3. Solid state chemistry</p> <p>3.1 Structures of solids: crystal structures, lattices & unit cells, close packing of spheres, holes in closed-packed structures.</p> <p>3.2 Structures of metals & alloys: polytypism, nonclosed-packed structures, polymorphism of metals, atomic radii of metals, alloys, substitutional solid solutions, interstitial solid solutions of non-metals, intermetallic compounds.</p> <p>3.3 Ionic solids: Basic characteristic structures of ionic solids, the rationalization of structures, ionic radii, radius ratio, structure maps, the energetics of ionic bonding, lattice energy.</p>	<p>9 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>4. Coordination Chemistry</p> <p>4.1 Introduction, representative ligands, nomenclature,</p> <p>4.2 Constitution & geometry, low coordination numbers, intermediate coordination numbers, higher coordination numbers, polymetallic compounds.</p> <p>4.3 Isomerism & chirality in square planar & octahedral complexes, ligand chirality.</p> <p>4.4 Thermodynamics of complex formation: formation constants, chelate & macrocyclic effects, steric effects & electron delocalization.</p> <p>4.5 Electronic properties of metal complexes: CFT applied to octahedral and tetrahedral complexes, magnetic moments/CFSE. Electronic spectroscopy: basic concepts, interpretation of spectra of d^1 & d^2 ions (Orgel diagram for octahedral and tetrahedral complexes).</p> <p>5. Organometallic Chemistry</p> <p>5.1 Introduction to organometallic chemistry, nomenclature, stability and inert gas rules (neutral atom and donor pair electron count methods).</p> <p>5.2 Ligands CO & phosphines, homoleptic carbonyls/synthesis/properties/ oxidation-reduction of carbonyls/ basicity/reactions of CO/spectroscopic properties of metal carbonyls.</p> <p>5.3 Oxidative addition and reductive elimination.</p> <p>6. Basic Bioinorganic Chemistry</p> <p>6.1 Macronutrients/micronutrients. Role of elements in biology. Metal ion transport role.</p> <p>6.2 Definition of metallobiomolecules / metalloporphyrins, structure of porphine and heme group, examples of metalloenzymes of copper and zinc.</p> <p>7. Acids and Bases</p> <p>7.1 Brönsted Acidity, proton transfer equilibria in water, solvent levelling, solvent system definition if acids & bases, characteristics of Brönsted acids,</p> <p>7.2 Periodic trends in aqua acid strengths, non-aqueous solvents, Lewis acidity, hard & soft acids and bases, solvents as acids & bases, superacids & superbases.</p>	<p>5 hr</p> <p>4 hr</p> <p>3 hr</p> <p>5 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

---	---	--

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels so as to have basic knowledge of experimental chemistry.	No. of lectures
Course Objectives:	Students shall be trained in the preparation of coordination compounds / double salts, understanding of redox chemistry, determination of metal content and degree of hydration, and determination of the formula of synthesized compounds. Students will be given hands-on experience in using colorimeter / UV-Vis spectrophotometer while performing instrumental analysis.	
Course Outcomes:	1. Students should be in a position to: i) set up and perform inorganic synthesis ii) isolate and purify crystalline product. iii) develop skills for compound characterization iv) determine the metal content by titrimetry / gravimetry /colorimetry.	
Content:	<p>Synthesis of inorganic compounds (any six)</p> <ol style="list-style-type: none"> 1. $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ 2. $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ 3. $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]\text{Cl}_3$ 4. $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 5. $\text{K}_3[\text{Cr}(\text{SCN})_6] \cdot 4\text{H}_2\text{O}$ 6. $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 7. $[\text{Cr}(\text{OAc})_2]_2 \cdot 2\text{H}_2\text{O}$ 8. Potash alum from scrap aluminium 9. Zinc iodide (Redox synthesis) <p>Quantitative estimations/determinations (any six)</p> <ol style="list-style-type: none"> 1. Estimation of Ni in $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ titrimetry/gravimetry 2. Estimation of Co in $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ volumetrically 3. Estimation of oxalate in $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ or $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ 4. Estimation of nitrite by redox titration 5. Estimation of calcium in calcite ore 6. Estimation of copper in gun metal alloy or Devarda's alloy iodometrically 7. Estimation of Cr in chrome alum and $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ to determine degree of hydration. 8. Colorimetric determination of Cr or Ni 	<p>24 hr</p> <p>24 hr</p>
Pedagogy:	Students should be given suitable pre-lab and post-lab assignments and explanation revising the theoretical aspects of laboratory experiments prior to the conduct of each experiment. Each experiment should preferably be done individually by the students.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ICO-401

Title of the Course: Topics in Inorganic Chemistry & Environmental Chemistry

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Student should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels and / or CHIC-401 course so as to have basic knowledge of Inorganic / environmental chemistry.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To provide fundamental aspects of transition & inner transition metals & their compounds.2. To provide knowledge of main group elements of the periodic table & their compounds3. To introduce various global phenomenon's of atmosphere & environment, follow directive of the Supreme Court in 1993 to introduced environmental education at all levels, have a fair knowledge on the various global activities to justify permissible or adverse, so that future generation are not adversely affected.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in position to understand fundamentals / usefulness of transition & inner transition metals.2. Students should be in position to understand chemistry main group elements.3. Students shall be aware of the maintenance of healthy living atmosphere on the globe.	
Content:	<p style="text-align: center;">SECTION-I</p> <p>1. Chemistry of transition & inner transition elements</p> <p>1.1 Transition elements: IUPAC definition of transition elements, occurrence, physical & chemical properties, noble character, metal oxides & oxido complexes, examples of metal-metal bonded clusters.</p> <p>1.2 Inner transition elements: Lanthanides, occurrence, properties, oxidation states, electronic structure, colour and spectra, magnetic properties, lanthanide contraction, compounds of lanthanides. Actinoid chemistry, general trends.</p> <p>2. Main group elements and their compounds</p> <p>2.1 Boron group: Compounds of boron:- borazine and boron nitride, synthesis, properties, structure & bonding. Borates: classification, structures & examples.</p> <p>2.2 Carbon group: Allotropes of carbon including C₆₀, intercalation compounds of graphite, carbides. Compounds of silicon: silicates, zeolites & silicones.</p> <p>2.3 Nitrogen group:- Introduction: oxides & oxyacids of nitrogen. 2.4 Oxygen group: oxyacids & oxohalides of S, S₄N₄ ring compounds: synthesis, properties, structure & bonding.</p>	<p>9 hr</p> <p>9 hr</p>

	<p style="text-align: center;">SECTION-II</p> <p>1. Atmosphere Structure and properties of the atmosphere, composition of atmosphere and vertical temperature behaviour, lapse rate and temperature inversion.</p> <p>2. Air Pollution Classification of air pollutants and photochemical reactions in the atmosphere Common air pollutants (e.g. CO, NO_x, SO₂, hydrocarbons and particulates) (a) sources (b) physiological and environmental effect (c) monitoring, d) various remedial & technological measures to curb pollution. Air quality standards.</p> <p>3. Water pollution Importance of buffer & buffer index in waste water treatments. Chemical, physical & biological characteristics of water pollution, specific & non-specific characterization of water. DO, BOD, COD, and chlorine demand, typical water treatment & waste water treatment (Municipal).</p> <p>4. Treatment of Industrial wastes Electroplating industry, fertilizer industry and pharmaceuticals industries.</p> <p>5. Biogeochemical cycles: Carbon and Nitrogen cycles nature</p>	<p>2 hr</p> <p>7 hr</p> <p>5 hr</p> <p>2 hr</p> <p>2 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.	
Text books / reference books	<ol style="list-style-type: none"> 1. P.W. Atkins, T. Overton, J. Rourke, M. Weller, & F. Programme: M. Sc. Part-I (Chemistry)

Course Code: OCC-401

Title of the Course: Structure, reactivity, stereochemistry and reaction mechanism

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	3. Introduction of various concepts based on molecular orbital theory. 4. Introduction of topicity, prostereoisomerism and chemo-, regio- and stereoselectivity in organic reactions. 5. Learning mechanistic aspects of various type of reactions in organic synthesis.	
Course Outcomes:	5. Students should be in a position to evaluate effect of delocalization of electrons & presence or absence of aromaticity in organic compounds. 6. Students should be in a position to apply various concepts in stereochemistry to understand stereochemical output in a reaction. 7. Students shall be in a position to understand/propose plausible mechanism of organic reactions.	
Content:	1. Molecular orbitals and delocalized chemical bonding: Qualitative description of Molecular orbitals of simple acyclic and monocyclic Systems, Frontier molecular orbitals, Conjugation, cross conjugation, resonance, hyperconjugation and tautomerism (types and examples), Aromaticity: Origin of Huckel's rule, examples of aromatic, non-aromatic and antiaromatic compounds; concept of Mobius aromaticity. 2. Structure & Reactivity: Acidity, basicity and pKa of organic compounds; Acid and base strengths; HSAB concept & Factors affecting it, Effect of structure & medium on acid and base strength, Concept of superacids and superbases, Electrophilicity & Nucleophilicity, Examples of ambident nucleophiles & electrophiles. (Including revision of aromatic electrophilic and nucleophilic substitution) 3. Stereochemistry: Brief revision of configurational nomenclature: R & S; D & L; E & Z; cis & trans and <i>syn</i> & <i>anti</i> nomenclature. Chirality in molecules with two and more chiral centres. Conformational analysis of open chain compounds (Butane, 2, 3-butane diol, 2,3-dibromobutane etc.). <i>Erythro</i> and <i>threo</i> nomenclature. Topicity and Prostereoisomerism: Topicity of ligands and faces-homotopic, enantiotopic and Cram's rule / diastereotopic ligands and faces. Introduction to chemoselective, regioselective and stereoselective reactions. Stereochemistry of <i>cis</i> - and <i>trans</i> -decalins, conformation and reactivity of cyclohexane and substituted cyclohexanes, cyclohexene / cyclohexanone. 4. Reaction Mechanism: Brief revision of carbocations, carbanions, free radicals, carbenes and nitrenes with reference to generation, structure, stability and reactivity; Types of mechanisms, types of reactions, thermodynamic and kinetic control. The Hammond postulate and principle of microscopic reversibility, Methods of determining reaction mechanisms like- 1) Identification of products,	06 hr 06 hr 08 hr 06 hr

	<p>2) Determination of the presence of intermediates (isolation, detection, trapping and addition of suspected intermediate, 3) Isotopic labelling, 4) Stereochemical evidence, 5) Kinetic evidence and 6) Isotope effect (at least two reactions to exemplify each method be studied)</p> <p>5. Aliphatic Nucleophilic substitution: Brief revision of nucleophilic substitutions with respect to Mechanism, Various factors affecting such reactions; The Neighbouring Group Participation (NGP)/ Anchimeric assistance: General approach to various NGP processes; NGP by unshared/lone pair of electrons; NGP by π-electrons; NGP by aromatic rings (formation of phenonium ion intermediate); NGP by sigma bonds with special reference to bornyl and nor-bornyl system (formation of non-classical carbocation)</p> <p>6. Elimination reactions: The E2, E1 and E1cB mechanisms. Orientation of the double bond, Saytzeff and Hofmann rule. Effects of changes in the substrate, base, leaving group and medium on 1) overall reactivity, 2) E1 vs. E2 vs. E1cB and 3) elimination vs substitution, Mechanism and orientation in pyrolytic <i>syn</i> elimination (various examples involving cyclic and acyclic substrates to be studied).</p>	<p>06 hr</p> <p>04 hr</p>
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

	<p>3. Organic synthesis (any four experiments):</p> <p>a) Aliphatic electrophilic substitution: Preparation of iodoform from ethanol & acetone.</p> <p>b) Aromatic electrophilic substitution (any one): Preparation of p-bromoacetanilide, bromination of acetophenone to phenacyl bromide, nitration of naphthalene to 1-nitronaphthalene, nitration of benzaldehyde to 3-nitrobenzaldehyde.</p> <p>c) Oxidation of: i) Benzoic acid from toluene ii) Cyclohexanone from cyclohexanol, iii) isoborneol to camphor using Jones reagent (any one).</p> <p>d) Reduction (any one): Reduction of o-nitroaniline to o-phenylenediamine using Sn/HCl; Reduction of p-nitro benzaldehyde to p-nitrobenzyl alcohol using NaBH₄</p> <p>e) Bromination of an alcohol using CBr₄/ triphenylphosphine.</p> <p>f) Grignard reaction: Triphenylmethanol from benzoic acid ester or benzophenone. g) Aldol condensation: Dibenzal acetone from benzaldehyde</p> <p>h) Acetoacetic ester condensation : Preparation of ethyl n-butylacetoacetate or ethyl acetoacetate.</p> <p>i) Cannizzaro reaction using 4-chlorobenzaldehyde as substrate.</p> <p>j) Friedel Craft's reaction (any one): using toluene and succinic anhydride, resorcinol to resacetophenone, benzene and maleic anhydride to β-benzoylacrylic acid</p> <p>k) Solvent free preparation of coumarin by the Knoevenagel condensation under MW irradiation.</p> <p>l) Preparation of oxidizing agent (any one): Pyridinium chlorochromate-silica, pyridinium chlorochromate-alumina, MnO₂.</p> <p>m) Preparation of cuprous chloride.</p> <p>3. Isolation from natural sources : (any one) Caffeine from tea powder, piperine from pepper, cinnamaldehyde from cinnamon</p>	16 hr
Pedagogy:	Students should be given suitable pre- and post-lab assignments and explanation revising the theoretical aspects of laboratory experiments prior to the conduct of each experiment. Each of the experiments should be done individually by the students.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCO-401

Title of the Course: Synthetic Organic Chemistry I

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels as well as the course CHOC-401 so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	1. Introduction to concepts of functional groups and their interconversion 2. Learning mechanistic concepts of carbon-carbon bond making by nucleophilic addition to carbonyl group 3. Learning mechanistic aspects of various oxidation & reduction processes used in organic syntheses.	
Course Outcomes:	1. Students should be in a position to choose appropriate oxidizing agent for oxidation of a particular functional group. 2. Students should be in a position to choose appropriate reducing agent for reduction of a particular functional group. 3. Students shall be in a position to understand/propose plausible mechanism of organic reactions. 4. Student should be able to choose appropriate nucleophilic addition reaction for making carbon-carbon bond.	
Content:	<p>1. Oxidation reactions: Oxidation of organic compounds using chromium (PCC, PDC) and manganese compounds, Oppenauer oxidation, Swern oxidation, ozonolysis. Other methods of oxidation such as selenium dioxide, Pb(OAc)₄, HIO₄, peracids, peroxides, OsO₄, RuO₄, DMSO (Swern) sodium bromate / CAN & NaOCl, DDQ, Prevost's reagent and Woodward Conditions; Catalytic oxidation over Pt, Photosensitised oxidation of alkenes, oxidation with molecular oxygen, aromatization, silver based reagents.</p> <p>2.Reduction reactions: Reduction of organic compounds using hydride-transfer reagents and related reactions : MPV reduction, NaBH₄, Trialkylborohydrides, LAH & lithium hydridoalkoxyaluminates, mixed LAH-AlCl₃ reagents, DIBAL and reduction with borane and dialkylboranes, Enzymatic reduction involving liver alcohol dehydrogenase/NADH & Bakers' yeast, catalytic hydrogenation, Dissolving metal reductions including acyloin condensation, Clemmensen reduction and Birch reduction, Other methods of reduction: Wolff-Kishner, Raney Ni desulphurisation, di-imide.</p> <p>3.Halogenation: Formation of Carbon Halogen bonds: Substitution in saturated compounds, alcohols, carbonyl compounds, substitution at allylic and benzylic compounds, bromodecarboxylation (Hunsdiecker reaction), Finkelstein reaction, iodolactonisation.</p>	<p>11 hrs</p> <p>9 hrs</p> <p>5 hrs</p>

	4. Esterification, amide preparation and hydrolysis: (study of different mechanisms and reagents)	6 hrs
	5. Name reactions: Knoevenegel Reaction, Claisen, Darzen, Stobbe, Perkin, Aldol, Benzoin, Pechmann condensation.	5 hrs
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in chemistry at F.Y B.Sc, S.Y B.Sc & T.Y B.Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	6. Introduction of various concepts on thermodynamics. 7. Introduction of electro chemistry and kinetics. 8. Learning quantum chemistry.	
Course Outcomes:	8. Students should be in a position to understand various concepts in physical chemistry. 9. Students should be in a position to apply these concepts during the lab course in physical chemistry. 10. Students shall be in a position to answer the NET/SET examination questions based on these topics.	
Content:	<p>1.Thermodynamics</p> <p>1.1 Thermodynamic properties: Gas laws, Real gasses, Boyle temperature, Critical temperature, State and path properties. Intensive and extensive properties. Exact and inexact differentials. Internal energy, enthalpy, entropy, free energy and their relations and significances. Maxwell relations. Thermodynamic equations of state.</p> <p>1.2 Joule-Thomson effect. Joule-Thomson coefficient for van der Waals' gas. Joule-Thomson effect and production of low temperature, adiabatic demagnetization, Joule-Thompson coefficient, inversion temperature.</p> <p>1.3 The third law of thermodynamics. Need for the third law. Apparent exceptions to third law. Application of third law. Use of thermodynamic functions in predicting direction of chemical change. Entropy and third law of thermodynamics.</p> <p>1.4 Phase equilibria: Phase rule, Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.</p> <p>1.5 Three component systems: Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. The role of added salts.</p> <p>2.Electrochemistry</p> <p>2.1 EMF series, decomposition potential and overvoltage, electronegativity, basic principles, completeness of deposition, Separation with controlled potentials, constant current electrolysis, composition of electrolyte, potential buffers, physical characteristics of metal deposits.</p> <p>2.2 Electroplating and electroless plating, electrosynthesis.</p> <p>2.3 Concepts of acid-base aqueous and non-aqueous solvents, hard and soft acid-base concept and applications.</p>	<p>10 hrs</p> <p>06 hrs</p>

	3.Chemical Kinetics 3.1 General introduction to various types of order of reaction including fractional order, Molecularity of the reaction. 3.2 Introduction to reversible and irreversible reactions and reactions leading to equilibrium. Van'tHoffs equation and analysis of Gibbs free energy of equilibrium reactions. 3.3 Collision Theory and Maxwell Boltzmann distribution of energies of colliding molecules(derivationnotrequired). The concept of collisional cross section and reactive cross section and its significance. 3.4 Comparative study of transition state and collision state theory (derivation not required). 3.5 Free radical reactions, Complex reactions such as acetaldehyde decomposition and reaction between H ₂ and Br ₂ , Homogeneous reactions and acid-base catalysis. 3.6 Elementary enzyme reactions.	07 hrs
	4. Quantum Chemistry 4.1 Operators, Functions, Eigen value equations, Postulates. 4.2 Schrodinger equation, application to simple system viz. free particle, particle in one dimensional, two dimensional and three dimensional box (quantization, separation of variables, degenerate wave functions). 4.3 Hydrogen like atoms, Schrodinger equation and its solutions, atomic orbital wave functions and interpretation. 4.4 Hückel MO theory, Secular equations, Secular determinant, delocalization energy, charge density, π-bond order, free valence, applications to C ₂ H ₄ , C ₃ H ₅ (radical), C ₄ H ₆ , C ₄ H ₄ , C ₆ H ₆ , C ₆ H ₈	13 hrs
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers /assignments / presentations / self-study or a combination of some of these may be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: PCC-402 Title of the Course: Laboratory Course in Physical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Chemistry at F Y B Sc, S Y B Sc & T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various concepts on thermodynamics. 2. Introduction of electro chemistry and kinetics.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry by conducting experiments. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	1. To study the kinetics of hydrolysis of ethyl acetate and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 2. To study the kinetics of the reaction between Potassium persulphate (K ₂ S ₂ O ₈), and Potassium iodide (KI), and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 3. To determine the order of reaction between potassium persulphate and potassium iodide by graphical, fractional change and differential methods. 4. To determine the degree of hydrolysis of salt of weak base and strong acid using conductometer. 5. To determine the composition of a mixture of acetic acid, dichloroacetic acid and hydrochloric acid by conductometric titration. 6. To determine the dissociation constants of a dibasic acid and obtain derivative plot to get equivalence point. 7. To determine the dissociation constants of a tribasic acid (Phosphoric acid) obtain derivative plot to get equivalence point. 8. To determine formal redox potential of Fe ²⁺ /Fe ³⁺ and Ce ³⁺ /Ce ⁴⁺ system obtain derivative plot to get equivalence point. 9. To study the three component system such as toluene, ethanol and water. 10. To study the three component system such as acetic acid, chloroform; and water and obtain tie line. 11. To determine the molecular weight of polyvinyl alcohol by viscosity measurement. 12. To determine the molecular weight of polystyrene by viscosity measurement.	48 hrs
Pedagogy:	Lectures / tutorials / seminars / term papers / assignments / presentations / self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.	
References/ Readings	1. A. Finlay & J.A. Kitchener, " <i>Practical Physical Chemistry</i> ", Longman 2. F. Daniels & J.H. Mathews, " <i>Experimental Physical Chemistry</i> ", Longman. 3. A.M. James, " <i>Practical Physical Chemistry</i> ", 4. D.P. Shoemaker & C.W. Garland, " <i>Experimental Physical Chemistry</i> ", McGraw-Hill.	

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Physical Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various mathematical concepts for Chemistry. 2. Introduction of topics viz. magnetic materials and properties, photochemistry, Nano materials.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry. 3. Students shall be in a position to answer the NET / SET examination questions based on these topics.	
Content:	<p>1.Mathematical Preparations:</p> <p>1.1 Introduction to various functions and function plotting (exponential, logarithmic, trigonometric etc.), functions of many variables. Complex numbers and complex functions.</p> <p>1.2 .Linear equations, vectors, matrices and determinants.</p> <p>1.3 Basic rules of differentiation and integration, Partial differentiation, location and characterization of critical points of a function, Regression methods, curve fitting.</p> <p>1.4 Introduction to series, convergence and divergence, power series, Fourier series, Fourier transformations and Numerical methods</p> <p>2.Magnetic Properties</p> <p>2.1 Types of magnetism (dia, para, ferro, antiferro and ferrimagnetism) Magnetic susceptibility and its determination.</p> <p>2.2 Magnetization curves and hysteresis, magnetic anisotropy, magnetic exchange interactions, Neel temperature and magnetic transition.</p> <p>2.3 Ceramic magnetic materials, Applications of magnetic Materials</p> <p>3.Photochemistry:</p> <p>3.1 Absorption and emission of radiation of photochemical interest. Einstein's equation.</p> <p>3.2 Jablonskii's diagram illustrating fluorescence and phosphorescence.</p> <p>3.3 Prompt and Delayed Fluorescence. Factors affecting Fluorescence life time and quantum yield.</p> <p>3.4 Flash photolysis and lasers. Photosensitised reactions and photosynthesis.</p> <p>4. Nanomaterials:</p> <p>4.1 Introduction, Chemical synthesis and methods of structural characterization.</p>	<p>18 hrs</p> <p>08 hrs</p> <p>06 hrs</p> <p>04 hrs</p>

	4.2 Areas of application, Societal health and environmental impact.	
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / self-study / or a combination of some of these can be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Course Code: ACC-501

Title of the Course: Fundamentals of Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge about difference between analytical chemistry and chemical analysis, role of analytical chemist, differences between conventional method of analysis and instrumental methods.	
Course Objectives:	<ol style="list-style-type: none">1. Introduction to the various chemical method of analysis, details of underlying principle of chemical methods, advantages and limitations2. Application of chemical methods for qualitative and quantitative estimation	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand basic principle behind different conventional method of analysis.2. Student should understand the limitation of method of analysis, should be in a position to choose for appropriate chemical method for particular analysis3. Students should be in a position to understand the basic chemistry on which the method of analysis based on.	
Content:	<p>1 Acid-Base Titrations Theory of acid-base indicators for Acid-Base titrations; colour change; range of indicator; selection of proper indicator; indicator errors; neutralization curves for strong acid-strong base, weak acid-strong base and weak base-strong acid weak acid-weak base titrations; poly functional acids and bases; titration curves for poly functional acids and bases; titration curves for amphoteric species; determining the equivalence point; feasibility of acid - base titrations; magnitude of the equilibrium constant; effect of concentration; typical applications of acid-base titrations.</p> <p>2 Precipitation titrations Introduction; feasibility of precipitation titrations; titration curves; effect of titrant and analyte concentration on titration curves; effect of reaction completeness on titration curves; titration curves for mixture of anions; indicators for precipitation titrations; the Volhard, the Mohr and the Fajans methods</p> <p>3 Complexometric titrations The complex formation reactions; stability of complexes; stepwise formation constants; organic complexing agents; amino carboxylic acid titration; EDTA; acidic properties of EDTA; EDTA complexes with metal ions; equilibrium calculations involving EDTA in solution; condition of formation constants; EDTA titration curves; effect of other complexing agents on EDTA; factor affecting the titration curves; completeness of reaction; indicators for EDTA titrations; theory of common indicators; titration methods using EDTA- direct titration, back titration and displacement titration; indirect determinations; titration of mixtures; selectivity, masking and demasking agents; applications of EDTA titrations- hardness of water; magnesium and Al in antacids; magnesium, manganese and zinc in a mixture.</p>	<p>10 hrs</p> <p>3hrs</p> <p>8hrs</p>

	4. Basic concepts in Electrochemical Titrations Faradic and non-Faradic currents; reversible and irreversible cells; EMF series; standard electrode potential; Nernst equation; calculation of cell potential; effect of current; ohmic potential; polarization; decomposition potential; over voltage; concentration polarization; mechanism of mass transport; introduction to potentiometric methods 5. Redox titrations Redox Titrations: Equilibrium constants for redox reactions- electrode potentials in equilibrium systems; calculation of equilibrium constants; redox titration curves- formal redox potentials; derivation of titration curves; factors affecting the shape of titration curves concentration; completeness of reaction; titration of mixtures- feasibility of redox titrations; detection of end point and redox indicators; structural aspect of redox indicators; specific and nonspecific indicators; choice of indicator; potentiometric end point detection; sample preparation- pre-reduction and pre-oxidation. 6. Radioimmunoassay Radioimmunoassay; its principle and applications; instrumentation for radio bioassay; clinical application of the radioimmunoassay of insulin, estrogen and progesterone; receptor techniques of breast cancer; enzyme- linked immunosorbent assay; principles; practical aspects; applications. 7. Gravimetric analysis Introduction; properties of precipitates and precipitating reagents; completeness of precipitates; super saturation and precipitate formation; particle size and filterability of precipitates; colloidal precipitates; crystalline precipitates; purity of the precipitate; co-precipitation, post precipitation; conditions for precipitation; fractional precipitation; precipitation from homogenous solution; organic reagent as precipitants-dimethyl gloxime, oxine, cupferon, salicyldoxime, washing of precipitates; drying and ignition of precipitates; calculation of results from gravimetric data; applications.	3 hrs
		4 hrs
		3 hrs
		5hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-502

Title of the Course: Techniques in Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques such as colorimetry, pH-metry, emission techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
<u>Course Objectives:</u>	1. Introduction of various experimental techniques for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
<u>Course Outcomes:</u>	1. Students should be in a position to differentiate between various analytical techniques based on their theory and sensitivity achieved. 2. Exposure to various electrochemical and optical techniques for its application to qualitative and quantitative estimation at trace level.	
<u>Content:</u>	1. Principles and practise of optical analytical techniques –Part-1 1.1. Nephelometry and Turbidimetry: Introduction to principle, instrumentation and application of nephelometry, turbidimetry. Factors affecting measurement, choice between nephelometry and turbidimetry; turbidimetry and colorimetry; nephelometry and fluorimetry; applications of nephelometry and turbidimetry. 1.2. Introduction, principle and Instrumentation of Polarimetry; application of optical rotation method in rate constant determination; acid- catalyzed muta rotation of glucose; inversion of cane sugar; relative strengths of acids. Introduction to terms such as optical rotatory dispersion (ORD), plan curves, cotton effect curves, circular dichroism, octant rule for ketones.	10hrs
	2. Principles and practise of optical analytical techniques –Part-2 2.1. Principles and practices of Spectrophotometric Analysis: Introduction; law of absorption; absorbance and transmittance spectrum; technique for colour comparison; spectrophotometer instrumentation- single and double beam spectrophotometer; applications 2.2. Principles of Emission Techniques: Theory; excitation techniques; electrodes and their shapes; Quantitative and qualitative application, brief introduction to ICP-MS	10hrs
	3. Principles and practise of electro analytical and thermal techniques 3.1. Introduction to Ion selective electrodes; construction, application and selectivity coefficient of Ion selective electrode; pH measurement; buffer solution; glass electrode; instrument for pH measurement. 3.2. Thermoanalytical Methods: Thermogravimetry, Differential Thermal Analysis (DTA), and Differential Scanning Calorimetry: DSC 3.3. Basic aspects of conductometric titration; types of conductometric titration; advantages and disadvantages of conductometric titration;	16hrs

	<p>Introduction; theory; instrumentation; advantages, disadvantages and applications of High frequency titrations.</p> <p>3.4. Karl Fischer Titration: Introduction; theory; instrumentation; advantages, disadvantages and applications; Karl Fischer reagent- Introduction; determination of water content in industrial samples.</p>	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling at MSc part-I level.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different separation techniques used for qualitative, quantitative estimation	
Course Outcomes:	1. Students should be in a position to understand principle behind different purification techniques. 2. Students should be in a position to select the separation techniques for purification of analytes from interferents. 3. To understand the HPLC method development and application in qualitative and quantitative analysis	
Content:	<p>1. Basic Separation Technique:</p> <p>1.1. General aspects of separation techniques-role of separation technique in analysis;</p> <p>1.2. Separating the analyte from interferents</p> <p>1.3. General theory of separation efficiency: Separation factor</p> <p>1.4. Classifying separation techniques: Separations based on Size; Separations based on mass or density, Separations based on complexation reactions (Masking); Separations based on a change of state; Separations based on a partitioning between phases. (Note: Following techniques shall be discussed as representative example)</p> <p>1.5. Basic principles of distillation; theory of vacuum, steam, azeotropic and fractional distillation.</p> <p>1.6. Fractionation by solvent extraction: based on chemical nature and based on polarity of analyte.</p> <p>1.7. Centrifugation techniques: Sedimentation velocity, Analytical and preparative centrifugation; Density gradient centrifugation; applications in separation.</p> <p>2. Chromatographic Methods:</p> <p>2.1. Introduction to chromatography: definitions, theories, principles of chromatographic technique, terms and parameters used in chromatography, classification of chromatographic methods, Partition versus adsorption chromatography, development of chromatograms, qualitative and quantitative analysis by chromatography;</p> <p>2.2. Planar Chromatography (Paper and thin layer):</p> <p>2.2.1. Paper Chromatography- introduction, principle, theory, types (ascending, descending, circular, two dimensional paper chromatography); techniques; choice of solvent; multiple development, qualitative and quantitative measurement applications;</p> <p>2.2.2 Thin Layer Chromatography (TLC)- definition; mechanism; efficiency of thin layer plates; methodology (technique); criteria</p>	<p>6 hrs</p> <p>24hrs</p>

	<p>for selection of stationary and mobile phases (numerical to calculate elution strength of mixed solvents used as mobile phase); choice of adsorbents; preparation of plates; spotting (spot capacity); development of chromatogram; identification and detection using physical and chemical methods; reproducibility of R_f values and improving resolution; Two-dimensional TLC; comparison of TLC with paper chromatography, column chromatography, thin layer ionophoresis and electrophoresis; Qualitative, quantitative evaluation and applications;</p> <p>2.3. High-performance TLC (HPTLC): introduction, principle, theory, classification (classical, high performance, ultra, preparative HPTLC); Difference between TLC and HPTLC with respects to the parameters; scanning densitometer; Quantitative analysis using TLC-densitogram and applications.</p> <p>2.4. Gas Chromatography (GC): Instrumentation, selection of operating condition, choices of GC column, methods to prepare derivatives of samples (silylation, acylation, alkylation), working principle of GC detectors such as TCD, ECD, FID, Analysis of GC data and quantification methods such as normalizing peak area, internal std., external std, standard addition.</p> <p>2.5. Column Chromatography- definition; types (conventional, flash, LPLC, Dry column vacuum chromatography); principle; packing, loading, eluting and collecting eluent in the column chromatography and experimental requirements; theory of development; migration rates of solutes; band broadening and column efficiency; variables that affect column efficiency; Van Deemeter equation and its modern version; scale-up and thump rule for conventional column, qualitative and quantitative analysis; applications.</p> <p>2.6. Liquid-liquid partition chromatography (HPLC)- Introduction; selection of stationary and mobile phase; types of bonded phase chromatography-NPC and RPC and stationary phases used; reversed phase partition chromatography; steps in HPLC method development in partition chromatography- elution techniques (isocratic and gradient, ion pairing agents, buffer agents, organic modifiers); optimization of capacity factor, gradient selectivity factor and column plate numbers; numerical on method development using Snyder's polarity index. Preparative vs analytical HPLC; Chiral chromatography- Pirkle stationary phases, examples of enantiomer separation such as ibuprofen, calculation of enantiomeric excess. Choosing detectors- working principle of RI, UV-Vis, conductivity and ELSD.</p> <p>2.7. Size Exclusion Chromatography: definition; theory; principle; types; stationary phases in gel chromatography; physical and chemical characteristics of gel, mechanism of gel permeation chromatography (GPC); instrumentation of GPC; applications of GPC- determination of molecular weight of polymer with numericals.</p> <p>2.8. Supercritical-Fluid Chromatography: introduction; important properties of supercritical-fluids; instrumentation and variables, SFC column vs other column, applications.</p>	
--	---	--

	3. Electrophoresis: 3.1. Theory of electrophoresis; Type of electrophoresis- Free solution and supporting medium electrophoresis, paper electrophoresis, capillary electrophoresis and gel electrophoresis. 3.2. Capillary electrophoresis-instrumentation, sample introduction in CE, types of CE methodology, electrophoretic mobility and electroosmotic mobility, total mobility, efficiency and resolution in CE column, numericals. 3.3. Gel electrophoresis - types of gel, Polyacrylamide gel electrophoresis PAGE, Agarose GE, factors affecting separation; 3.4. Staining and detecting electrophoresis band; 3.5. Separation of neutral molecule by MEKC; 3.6. Separation and determination of Vitamin B-complex by using CZE and MEKC.	6 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-504

Title of the Course: Spectral methods of analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
Course Objectives:	1. Introduction of various spectral methods for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
Course Outcomes:	1. Students should be in a position to understand theory and instrumentation of various spectral methods of analysis. 2. Understanding application of studied methods for qualitative and quantitative estimation at trace level.	
Content:	1. Automation of Analytical Method: An overview of automated system; definition; distinction between automatic and automated system; advantages and disadvantages by automation; types of automated techniques. Discrete and continuous automation, Introduction to Flow injection analysis.	5 hrs
	2. X-ray Absorption, Diffraction; Neutron Diffraction and Fluorescence Spectroscopy: Introduction; origin of X-rays; interaction of X-ray with matter; X-ray spectrometer; theory of X-ray absorption; X-ray diffraction by crystal; comparison of X-ray absorption with X-ray diffraction; Bragg's law; interpretation of X-ray diffraction powder pattern; calculation of lattice parameters; neutron diffraction introduction; theory; instrumentation and applications; X-ray fluorescence- introduction; applications. Introduction to Mossbauer spectroscopy; theory and application.	10hrs
	3. Molecular Fluorescence, Phosphorescence and Chemiluminescence Spectroscopy: Introduction; meaning of luminescence and chemiluminescence; principles of fluorescence, chemical structure and fluorescence; theory of molecular fluorescence; instrumentation- single and double beam filter fluorimeters, relationship between intensity of fluorescence and concentration; spectrofluorometer; phosphorimeter; factors influencing fluorescence and phosphorescence; basic differences in measurement of fluorescence and phosphorescence; advantages; limitations and precautions; selection of excitation wavelength for analysis; reporting fluorescence spectra; applications of fluorimetric analysis. Chemiluminescence: Introduction; principle; types; chemiluminescence with Luminol, instrumentation; measurement of chemiluminescence; quantitative chemiluminescence; Introduction to gas phase chemiluminescence analysis, chemiluminescence titrations and electro-chemiluminescence.	12hrs
	4. Microscopy: Chemical microscopy- microscope; parts and optical path; numerical aperture and significance; applications and qualitative and quantitative study;	9 hrs

	Electron microscopy- principle, operation, sample preparation, replicas, shadowing, application to analysis; electron probe analyzer, ion microscope; metallography- metallurgy, microscopic examination; specimen preparation and examination; interpretation of micrographs; SEM, TEM, AFM. Introduction to Magnetic resonance imaging (MRI) technique and Photo acoustic spectroscopy ; theory and applications	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-505

Title of the Course: Experiments in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses in Analytical Chemistry Practicals at MSc-I levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	1. Introduction of various experimental techniques for analysis. 2. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	1. Students should be in a position to use standardized material to determine an unknown concentration. 2. To gain experience with some statistics to analyse data in lab 3. Student should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p>This course consists of 7 units of experiments in various areas of Analytical chemistry. Minimum 14 experiments shall be carried out and at-least 2 experiments from each unit.</p> <p>UNIT 1: Analysis of Pharmaceutical Tablets/Samples</p> <ol style="list-style-type: none">1. Estimation of streptomycin in tablet sample by Maltol method2. Estimation of Ibuprofen / Paracetamol3. Estimation of sulphadiazine / sulphonamide4. Determination of moisture content in tablet powder by Karl Fischer titration <p>UNIT 2: Planar and column Chromatography</p> <ol style="list-style-type: none">1. Separation of alpha amino acids by paper chromatography and to study effect of mobile phase on resolution.2. Thin layer chromatography analysis of commercial available analgesic and to identify the active ingredients.3. Purification and determination of amount of paracetamol from commercial tablet by column chromatography4. Separation of a mixture of benzoin and benzil on silica gel column <p>UNIT 3: Ion exchange Chromatography and Solvent Extraction Method</p> <ol style="list-style-type: none">1. To determine the capacity of a cation exchange resin2. To separate organic mixture (acidic+basic+Neutral) by extraction3. To separation and estimate the zinc and nickel ions using an anion exchange resin4. To determine the Fe ion as Fe-oxine complex <p>UNIT 4: HPLC Analysis:</p> <ol style="list-style-type: none">1. HPLC analysis of benzaldehyde and benzyl alcohol using isocratic elution2. To study HPLC method development by using linear and stepwise gradient elution for binary system3. To analyze a mixture (benzene and toluene, anthracene and naphthalene) by Reverse phase-HPLC4. HPLC analysis of Analgesics in a commercial sample/tablet, Ibuprofen to develop and validate the analytical method of any one drug using HPLC	

	<p>UNIT 5: Gas Chromatographic Analysis:</p> <ol style="list-style-type: none"> 1. Quantitative analysis of a mixture of chloroform and carbon tetrachloride 2. Gas chromatographic analysis for a mixture of gases like O₂, N₂ and CO₂ <p>UNIT 6: Spectrophotometry Method:</p> <ol style="list-style-type: none"> 1. To determine pk value of methyl red indicator at room temperature 2. To determine the stoichiometry and stability constant of ferric salicylic acid complex by Job's method and mole ratio method 3. To determine the amount of each caffeine and benzoic acid from the soft drink by UV spectrophotometry. 4. To record UV absorption spectrum of acetone in n-hexane and in water to identify the various transition. <p>UNIT 7: Electrochemical Method:</p> <ol style="list-style-type: none"> 1. pH-metric determination of hydrolysis constant of aniline hydrochloride 2. pH-metric determination of the acid-base dissociation constant and isoelectric point of amino acid 	
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-501

Title of the Course: Bioanalytical and Forensic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the analytical chemistry at T Y B Sc (Chemistry) and M Sc part-I (Chemistry) levels.	
Course Objectives:	1. The purpose of this course is to provide basic understanding of medical laboratory clinical chemistry and forensic chemistry 2. Identify various types of evidence that may be collected at a crime scene including procedures for identification, collection, and analysis for the purpose of investigating and prosecuting crimes.	
Course Outcomes:	1. Apply principles of safety, quality assurance and quality control in clinical and forensic chemistry. 2. The students should be in position to select methods required for forensic and clinical sample analysis. 3. The students will be in a position to understand the principal and applications of various analytical methods used in clinical and forensic laboratory.	
Content:	1. Clinical Chemistry: 1.1. Composition body fluid; detection of abnormal levels of certain constituents leading to diagnosis of diseases; sample collection and preservation of physiological fluids; 1.2. analysis of physiological fluids- blood, urine and serum; estimation of blood glucose, cholesterol, urea, haemoglobin; urine-urea, uric acid, albumin, globulins, barbiturates, acid and alkaline phosphates;	7 hrs
	2. Human-nutrition: Estimation of enzymes, carbohydrates, essential amino acids, proteins and lipids.	4 hrs
	3. Food Analysis, Processing and Preservation: 3.1. Analysis of food such as milk, milk products, tea, coffee and beverages (soft drinks, alcoholic drinks), Flour, starch, honey, jams and edible oils. Analysis of preservatives, coloring matter, micronutrients. 3.2. Food processing and food preservation: Refining milling, canning, concentration, freezing Drying, pasteurisation sterilization irradiation.	8 hrs
	4. Forensic Science: Chemistry, Narcotics and toxicology 4.1. Narcotics and Psychotropic Substances Act: psychotropic substance; prohibition control; regulation offence and penalties. 4.2. Forensic Chemistry: Its role in crime; Types of cases received for Analysis; Procedures for sample selection, collection, preservation, identification. 4.3. Forensic chemical analysis of samples using classical and modern instrumental techniques: Analysis of alcohol and other spurious liquor, Examination of Petroleum products, Construction material for adulteration; Examination of burnt remains in arson cases; Analysis of dyes chemicals seized in crime; Types of explosives; commonly used explosives; their handling; analysis and	17hrs

	<p>identification of explosive residues.</p> <p>4.4. Narcotics: Definition; Narcotic drugs and Psychotropic; substances; Problems of drug abuse; drug addiction.</p> <p>4.5. Classification of Narcotic drugs;</p> <p>4.6. Identification of narcotic drugs by spot tests and other classical Methods for following drugs. (a) Narcotics- heroin and cocaine. (b) Stimulants- caffeine, amphetamines; (c) Depressants- Barbiturates, Benzodiazepines. (d) Hallucinogens- LSD</p> <p>4.7. Extraction of Narcotic drugs from different matrices; Isolation, purification, identification and estimation.</p> <p>4.8. Examination of Narcotic drugs using modern instrumental methods</p> <p>4.9. Toxicology: Definition; Its role in crime; Classification of poisons; commonly used poisons; signs and symptoms of poisoning; Sample collection, Handling and packing.</p> <p>4.10. Analytical Toxicology; Extraction of poisons from various matrices including visceral samples; Isolation; Purification identification and interpretation of findings. Use of both Classical and Modern Instrumental methods of chemical analysis of poisons.</p>	
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-502

Title of the Course: Calibration and Validation in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-2020

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques and statistical calculations related to topic. Knowledge of M.Sc.-Part I analytical courses is essential for better understanding of the course content	
Course Objectives:	1. Introduction of various aspect of calibration and validation 2. Study validation parameters and qualification of instrument	
Course Outcomes:	Students should be able to understand about calibration/validation and how it can be applied to industry and thus improve the quality of the products. The subject covers the complete information about basics of calibration & validation, types, methodology and application, the qualification of various equipment's and instruments.	
Content:	1. Calibration Significance of calibration in analytical chemistry. Standardizing methods; standards used, certified reference material. Blanks and controls; types and significance Statistical evaluation of analytical results; relative error, standard deviation, knowledge of q test, test of significance, linear Least Squares estimation and coefficient of regression Errors in calibration, Modes and protocols of calibration; External standard method, Standard addition method, Spiking, Internal standard method and standard bracket method. Introduction to common apparatus used in analytical laboratory and their calibration; volumetric glassware, Analytical Balances, pH meter, Oven and lab Refrigerator Excel-charts for calibration plot.	13 hrs
	2. Validation and qualification Introduction to validation, Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Validation and qualification, Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment. Regulatory requirements for analytical method validation International conference on harmonization (ICH) guideline Q2A Introduction to QA / QC, Safety Practices in a Chemical Laboratory	11 hrs
	3. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation	12 hrs

	Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-503

Title of the Course: Advanced Mass Spectrometry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. part-I (Chemistry) levels.	
Course Objectives:	1. Study of various theoretical concepts related to mass spectroscopic techniques. 2. Introduction of tandem mass spectrometry techniques. 3. Learning interpretational aspects of spectral data obtained from hyphenated techniques	
Course Outcomes:	1. Students should be in a position to understand principle behind different ionizations sources. 2. Students should be in a position to select mass analysers and ionization sources for analysis of particular type of analyte. 3. Students should be in a position to deduce structures of simple to moderately complex molecules/biomolecules by combining the spectral data obtained from hyphenated techniques.	
Content:	1. Introduction Mass spectrometry principle, general instrumentation, general interpretation procedure for mass spectra;	2 hrs
	2. Ionization methods: 2.1. Gas Phase ionization: electron ionization (EI), chemical ionization (CI), Field ionization and field desorption (FI, FD) 2.2. Particle Bombardment: Fast atom bombardment (FAB); Secondary ion mass spectrometry (SIMS) 2.3. Atmospheric pressure ionization: electrospray ionization (ESI), atmospheric pressure ionization (APCI) 2.4. Laser Desorption: MALDI 2.5. Inorganic ionization sources: thermal ionization; Spark source; Glow discharge, Inductively couple plasma (ICP)	10 hrs
	3. Mass analyzers: 3.1. Characteristics of analysers: nominal mass, mass accuracy, resolving power, resolutions, numericals to calculate nominal and accurate mass 3.2. Magnetic, electromagnetic and double focusing 3.3. Single Quadrupole and triple quadrupole 3.4. Time of flight analyser 3.5. Ion cyclotron resonance analyzer, 3.6. hybrid instrumentation 3.7. Detectors: electron multiplier, photon multiplier, Faraday cup (Note: instrumentation, working principles, characteristic features, advantages, practical consideration shall be discuss).	8 hrs
	3. Hyphenated Techniques: 3.1. Coupled techniques; Interface and their characteristic features; Importance of hyphenation of two analytical techniques; 3.2. Introduction and instrumentation of following techniques: GC-FTIR, GC-MS, LC-MS, MS-MS (tandem) mass spectrometry (use of	8 hrs

	<p>stable isotopes), ICP-MS, TG-MS.</p> <p>3.3. Analysis of chromatogram obtained from hyphenated techniques: Total ion chromatogram (TIC), Extracted Ion chromatogram (XIC).</p> <p>4. Tandem Mass spectrometry applications:</p> <p>4.1. Pharmacokinetic studies: Fate of drug in living organisms, metabolite identification, biotransformation of ziprasidone</p> <p>4.2. Tandem MS and fragmentation pattern of following drugs: Paracetamol, 2-mercaptopyridine, Sulfasalazine, Narcotics-amphetamine,</p> <p>4.3. Analysis of biomolecules-Protein and peptides: structure and sequence determination using fragmentation, solve problems based on MS/MS data.</p>	8 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the Concepts in Analytical Spectroscopy), Analytical techniques at MSC Semester I and II so as to have basic knowledge of environmental chemistry and instrumental analysis.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction to environmental application of chemistry 2. Studying pollution from chemical perspective. 3. Creating awareness about environmental acts of India 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Develop social concern for pollution based on various chemical process 2. Evaluate the use of various analytical techniques in environmental control and monitoring 	
Content:	<p>1. Water pollution</p> <ol style="list-style-type: none"> 1.1 Constituents of aquatic life 1.2 Nature and types of water pollutants: heavy metals, inorganic pollutants, organic pollutants, pesticides, soaps and detergents, radioactive pollutants; Water standards in India [IS 10500 (2012)] 1.3 Soaps and detergents pollutants: Analysis of Soaps and detergents, general scheme of analysis, active ingredients, Test for soap (fatty acid salts), test for synthetic detergents 1.4 Municipal water treatment 1.5 Treatment of water for industrial use 1.6 Water conditioning: principle of coagulation and flocculation, softening, disinfection, demineralisation, fluoridation, chlorination, ozone treatment, electrodialysis 1.7 Wastewater treatment: pH, aerobic and anaerobic water treatment 1.8 Mercury pollution and estimation of organomercurials; 1.9 Analysis of: Dissolved oxygen (polarography and oxygen electrode), Chemical oxygen demand, Biochemical oxygen demand; 1.10 case study -DDT, Kepone, Minamata (any other) <p>2 Air pollution</p> <ol style="list-style-type: none"> 2.1 Introduction to atmospheric chemistry 2.2 Photochemical processes (ozone depletion) 2.3 Chain reactions in atmosphere 2.4 Oxidation process in atmosphere 2.5 Acid-base reaction in atmosphere 2.6 Sources and sinks of air pollutants 2.7 Effect of air pollutants on living and non-living things 2.8 Methods for sampling air pollutants 2.9 Air pollution problems- world and India 2.10 Sources -analysis control of: oxides of carbon, nitrogen and sulphur, H₂S 2.11 Organic compounds in atmosphere 2.12 Air act of India 1981 2.13 Greenhouse gases and global warming 2.14 Radioisotopes in air 2.15 Methods to monitor and control air pollution: scrubbers, filters, gravity and cyclone separators, absorption, adsorption, condensation, 	<p>10 hrs</p> <p>10 hrs</p>

	<p>flare tower, gas sensing</p> <p>2.16 Noise pollution</p> <p>2.17 Case study-Bhopal gas tragedy, nuclear disasters-Chernobyl and Fukushima</p> <p>3 Soil pollution</p> <p>3.1 Soil macrostructure and microstructure,</p> <p>3.2 Micro and macronutrients of soil</p> <p>3.3 Inorganic and organic matter in soil</p> <p>3.4 Reactions in soil</p> <p>3.5 Fertilisers in soil; Analysis of fertilizer (N, P, K)</p> <p>3.6 Excessive use of agrochemicals</p> <p>3.7 Waste and pollutants in soil</p> <p>3.8 Type of pesticides, degradation of pesticides in soil (chemical, photochemical biochemical), Analysis of pesticides,</p> <p>3.9 Soil pollution Sources, prevention and control</p> <p>3.10 Biochemical effects of pesticides; analysis of pesticides</p> <p>3.11 Plastic pollution</p> <p>3.12 Municipal garbage treatment</p> <p>4. Instrumental Techniques in environmental chemical analysis.</p> <p>4.1 Neutron activation analysis</p> <p>4.2 Anodic stripping voltammetry, (Mixture: Cu, Pb, Zn, Cd)</p> <p>4.3 atomic absorption spectroscopy, (Cu, Co, Cr)</p> <p>4.4 Flameless atomic absorption, (Hg, Pb,)</p> <p>4.5 Inductively-coupled plasma-emission spectroscopy (B,W)</p> <p>4.6 X-ray fluorescence</p> <p>4.7 Infrared and non-dispersive infrared spectroscopy (nitrates, carbonate, CO)</p> <p>4.8 Chemiluminescence (NO_x)</p> <p>4.8 Gas and liquid chromatography(NO_x, CO, CO₂, VOC)</p> <p>4.9 Ion-selective electrodes, (F, Ag, S, Ca)</p> <p>4.10 Ion chromatography-(mixture: Ni, Co and Cu; chloride, nitrate and sulphate)</p> <p>Above techniques shall be discussed with minimum one environmental application</p>	<p>8 hrs</p> <p>8 hrs</p>
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-505

Title of the Course: Problems on combined Spectroscopy

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Study of various theoretical concepts related to organic spectroscopic techniques. 2. Introduction of commonly used 2D NMR techniques. 3. Learning interpretational aspects of spectral data pertaining to IR, PMR, CMR and MS.	
Course Outcome	1. Students should be in a position to deduce structures of simple to moderately complex molecules by combining the spectral data obtained using two or more spectral techniques. 2. Students should be in a position to apply various concepts in organic spectroscopy (PMR, CMR, MS and 2D NMR) and generate/ predict PMR, CMR, MS and 2D NMR spectral data based on given structures of simple molecules.	
Content:	1. Electronic and Infrared Spectroscopy: basic concepts; Application of electronic and IR spectroscopy in structural elucidation of organic compounds	04 hrs
	2. NMR Spectroscopy: Theory of Nuclear magnetic resonance, quantum description of NMR, classical description of NMR, Types of NMR spectra, environmental effects of NMR Spectra, the chemical shift, Applications of proton NMR in qualitative and quantitative analysis (in general).	05 hrs
	3. ^{13}C –NMR spectroscopy: Introduction, proton coupled and proton decoupled ^{13}C - spectra. Off- resonance decoupling, APT & DEPT techniques; ^{13}C chemical shifts – factors affecting the chemical shifts – Homonuclear (^{13}C - ^{13}C J) and heteronuclear (^{13}C – ^1H , ^{13}C – ^2H J) couplings.	06 hrs
	4. Two-dimensional NMR spectroscopy: Introduction to 2D-NMR, Classification of 2D experiments- 2DJ resolved spectroscopy; interpretation of spectra of simple organic compounds using following 2D-NMR techniques-COSY, NOESY, HSQC, HMQC, HMBC, TOCSY and INADEQUATE	07 hrs
	5. Identification of organic compounds using combined spectral methods: UV, IR, PMR, CMR, 2D NMR, Mass <i>(Note: More emphasis shall be given for solving combined spectroscopic data for structural elucidation)</i>	14 hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/	

	presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-506

Title of the Course: Chemometrics

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Introduction of various chemistry software used in quantification and calculations 2. Study validation parameters and qualification of instrument	
Course Outcome	Students should be able to understand about various software in chemometric and how it can be applied to analysis and thus improve the quality of the products. The subject covers the complete information about software and their application in quantifications.	
Content:	<p>1. Introduction to Data and Statistics: Introduction; Univariate Statistics Review, Probability, Variance and Sampling, Linear Regression and Calibration Data, Digitization, and the Nyquist Theorem, Detection Limit, S/N ratio, and Signal Filtering; Review of Linear Algebra: Scalars, Vectors, and Matrices, Matrix Notation and Matrix Operations Orthogonality, Analysis of Variance (ANOVA) - 1 Variable, Analysis of Variance - 2 Variables; Introduction to MatlabTM: Program Basics and Layout, Matrix Operations in MatlabTM The Diary Command and Examples, ANOVA in MatlabTM; Experimental Design: Factorial Design, Simple <i>versus</i> Complex Models, Factorial Design in MatlabTM ; Half-Factorial Design.</p> <p>2. Multivariate Methods I: Introduction to various multivariate methods; the Six Habits of a Chemometrician; Principle Component Analysis (PCA); data pretreatment- Mean Centering and Normalization; PCA in MatlabTM.</p> <p>3. Multivariate Methods II: Classical Least Squares (CLS), CLS in MatlabTM; Inverse Least Squares (ILS).</p> <p>4. Multivariate Methods III: Multiple Linear Regression (MLR); Principle Component Regression (PCR); Partial Least Squares, Examples in MatlabTM; Summary of Multivariate Methods; Pattern Recognition- Supervised versus Unsupervised Pattern Recognition, K Nearest Neighbours (KNN); Soft Independent Modelling for Chemical Analysis(SIMCA), Summary of Pattern Recognition.</p> <p>5. Computers in Chemistry: The students shall learn how to operate a PC and run standard programs and packages like MS-WORD, EXCEL, ORIGIN, SIGMA PLOT, and CHEM SKETCH; to solve Chemistry numerical (numerical taken preferably from Physical Chemistry for plotting first and second derivative curves, linear plots); numerical from Analytical Chemistry, Chemical Kinetics, Electrochemistry, Spectroscopy and other related topics; writing the structures of inorganic and organic molecules, chemical equations and other</p>	<p>10 hrs</p> <p>05 hrs</p> <p>04 hrs</p> <p>07 hrs</p> <p>10 hrs.</p>

	interesting applications will be taught.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

M Sc-II Inorganic chemistry
Semester III and IV Courses (Academic year 2019-2020 onwards)

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits
ICC 501	Coordination and organometallic Chemistry	3	ICO 501	Bioinorganic Chemistry	3
ICC 502	Materials Chemistry	3	ICO 502	Catalysis: The Basic Chemical concepts	3
ICC 503	Group Theory and Spectroscopy	3	ICO 503	Chemistry of P-Block Elements	3
ICC 504	Selected Topics in Inorganic Chemistry - I	3			
ICC 505	Experiments in Inorganic Chemistry	3	General Optional Courses		
			CGO-500	Dissertation	8
			CGO-501	Selected Experiments in Chemistry	8

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-501

Title of the Course: Coordination and organometallic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To make understand the electronic structure of compounds of d-block elements.2. To provide sufficient knowledge of CFT and MOT in coordination and organometallic compounds.3. To understand interpretation of magnetic and electronic properties of coordination compounds.4. To understand fundamental concepts of inorganic chemistry reaction mechanisms5. To provide knowledge on applications of organometallic compounds in homogenous catalysis.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the electronic structure of coordination and organometallic compounds.2. They will be well equipped with knowledge of CFT and MOT3. They will be in position to understand the magnetic and electronic properties.4. The concepts of inorganic reactions will be clear to them.5. They will know the applications of organometallic compounds in industries	
Content:	<p>1. Electronic structure of coordination compounds:</p> <p>1.1 Crystal field theory and its applications: a) Octahedral compounds; b) tetrahedral compounds; c) square-planar compounds and other geometries; d) tetragonally distorted compounds (Jahn-Teller Effect); e) octahedral vs tetrahedral</p> <p>1.2 Ligand field theory: a) σ bonding; b) π-bonding</p> <p>2. Magnetic Properties coordination compounds</p> <p>a) diamagnetism, b) paramagnetism; c) ferromagnetism, d) antiferromagnetism, d) temperature dependence magnetism; Curie law, Curie-Weiss Law.; e) spin cross over phenomenon</p> <p>3. Spectra of coordination compounds</p> <p>3.1 Electronic structure of atoms: a) spectroscopic terms; b) classification of microstates and energies of the terms; d) Racah parameters</p> <p>3.2 Electronic spectra: a) ligand field transitions; b) selection rules; c) spectroscopic terms of complexed ion; d) correlation and Orgel diagrams; d) Tanabe-Sugano diagrams; e) Charge-Transfer bands: LMCT transitions and MLCT transitions; f) Luminescence</p> <p>4. Inorganic reaction mechanisms:</p> <p>4.1 Substitution reactions in coordination compounds; b)</p>	<p>8 hr</p> <p>2 hr</p> <p>8 hr</p> <p>8 hr</p>

	<p>thermodynamic considerations; c) kinetic considerations; d) substitution reactions in octahedral compounds; e) substitution reactions in square planar compounds.</p> <p>4.2 Electron transfer reactions: inner sphere and outer sphere mechanism, Frank Condon principle, Marcus equation</p> <p>5. Organometallic compounds and reactions Significance of 18 electron rule, metal carbonyls & nitrosyls, reactions of organometallic compounds, metal centered catalysis in complex compounds, homogenous catalysis such as hydrogenation, hydroformulations, coupling reactions and isomerization of alkanes. Asymmetric catalysis, stereochemically rigid molecules.</p>	10 hr
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICC-502

Title of the Course: Materials Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICC-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of Materials Chemistry	No. of Hours
Course Objective:	To provide basic and advanced knowledge about solid state chemistry	
Course Outcome	This course will give sufficient information about the preparation of different types of materials, their structures, reactivity and properties.	
Content:	<p>1. Introduction to Materials chemistry</p> <p>2. Structure and bonding in solid materials: Crystal lattice; unit cell; Miller indices and planes; X-ray diffraction method; metallic, covalent and ionic solids; structural classification of binary and tertiary compounds.</p> <p>3. Non-stoichiometry in material solids: Oxygen deficient oxides, metal deficient oxides and classification of non-stoichiometry.</p> <p>4. Crystal defects: Types of defects: Point defects; Dislocations: Line defects and Plane defects</p> <p>5. Materials preparation techniques: I) Ceramic method II) Different wet chemical methods: A) For Powder materials: Co-precipitation, Precursor, Combustion, Sol-gel, Spray roasting, Freeze drying. B) For Single crystals: i) Growth from melt ii) Flux method iii) Epitaxial growth of single crystal thin films: Chemical and Physical methods iv) Chemical vapour transport v) Hydrothermal method vi) Dry high pressure method. C) For Amorphous Materials D) For Nanomaterials</p> <p>6. Reactivity of Solid Materials: Tarnish reactions, decomposition reaction, solid-solid reactions, addition reactions, double decompositions reaction, electron transfer reaction, solid-gas reactions, sintering, factors influencing reactivity of solids.</p> <p>7. Phase Transformations in Solid Materials: Thermodynamic consideration, structural change in phase transformation, Martensite transformation, temperature and pressure induced transformations, order- disorder transitions,</p>	<p>1 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p> <p>7 hr</p> <p>3 hr</p> <p>3 hr</p>

	<p>electronic transition, transformation with a change in composition.</p> <p>8. Electrical Properties: Electrical conductivity, free electron theory, fermi energy, insulators, semiconductor and conductors, band theory of semiconductor, Brillouin zones, Hall effect, the Seebeck effect, Superconductivity, BCS theory, Meissner effect, high temperature superconductor.</p> <p>9. Semiconductor Devices: Diodes, transistors and Junction field effect transistor, light meter, photodiode, phototransistor, solar cells, light emitting diodes, laser materials.</p> <p>10. Optical and dielectric properties: Luminescence and phosphorescence, piezoelectric, ferroelectric materials and applications.</p> <p>11. Magnetic properties: Introduction to magnetism, behaviour of substance in a magnetic field, magnetic moments, diamagnetism, paramagnetism, experimental determinations of susceptibility, ferromagnetism, anti-ferromagnetism and ferrimagnetism.</p>	<p>4 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p>
Pedagogy:	Lectures/ tutorials/ self-study or a combination of some of these.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-504

Title of the Course: Selected topics in inorganic chemistry - I

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To gain knowledge in selected topics in inorganic chemistry.2. To learn s-block elements, selected compounds of d-block and f-block elements.3. To understand the basic electrochemical processes in inorganic compounds.4. To study the applications of inorganic compounds in selected areas.	
Course Outcomes:	<ol style="list-style-type: none">1. Students will be able to gain knowledge regarding chemistry (abundance, preparation, properties) of s, d and f block elements.2. Students will be able to gain knowledge of fundamentals of inorganic electrochemistry and medicinal chemistry.	
Content:	<p>1. S-block elements and their compounds</p> <p>1.1 Hydrogen and hydrides: Electronic structure, position in periodic table, abundance, preparation, properties, isotopes, ortho and para hydrogen. Classification of hydrides, preparation & properties of hydrides; hydrogen ion, hydrogen bonding and its influence on properties.</p> <p>1.3 Group 1 Elements: Introduction, abundance, extraction, physical and chemical properties, solubility and hydration, solutions of metal in liquid ammonia, complexes, crowns and cryptands, electrides, alkalides, difference between lithium and the other group 1 elements, diagonal relationship between Li and Mg.</p> <p>1.4 Group 2 Elements Introduction, abundance, extraction, physical and chemical properties, solutions of metal in liquid ammonia, complexes, anomalous behaviour of beryllium, difference between beryllium and the other group 2 elements, diagonal relationship between Be and Al, preparation and properties Grignard reagent.</p> <p>2. Chemistry of d-block and f-block compounds</p> <p>2.1 Polyoxometallates; 1.2 metal sulphides and sulfido compounds; 1.3 Nitrido & alkylidyne compounds; 1.4 Metal-metal bonded compounds and clusters; 1.5 coordination & organometallic compounds of lanthanides; 1.6 Electronic spectra of lanthanides & actinide compounds; 1.6 Brief chemistry of thorium, uranium, neptunium, plutonium &</p>	<p>10 hr</p> <p>6 hr</p>

	<p>americium.</p> <p>3. Fundamentals of Inorganic Electrochemistry Basic aspects of electrochemistry, electron transfer reactions at electrode surface, potential and electrochemical cells, voltammetric techniques, linear voltammetry, cyclic voltammetry; reversible, irreversible and quasi-reversible processes; applications of cyclic voltammetry with reference to ferrocenes, transition metal complexes.</p> <p>4. Inorganic medicinal chemistry Anticancer agents: Platinum and Ruthenium complexes as anticancer drugs, Cancer chemotherapy, phototherapy, radiotherapy using borane compounds, Chelation therapy, Gadolinium and technetium complexes as MRI contrast agents, X-ray contrast agents, Anti-arthritis drugs, Anti-bacterial agents (Ag, Hg, Zn and boron compounds), Antiseptic and anti-biotic, Deodorants and anti-perspirants, Anti-viral agents (influenza, herpes, hepatitis and HIV viruses), Li drugs.</p> <p>5. Nuclear Chemistry Radioactivity, Decay processes and decay energy, half-life of radioactive elements, Nuclear fission and fusion processes, Nuclear reactor components and functions, Q values for nuclear reactions, Nuclear waste management, Radiation detection principles, Chemical separation techniques of radioactive elements, Radio-analytical techniques, Activation analysis.</p>	<p>4 hr</p> <p>8 hr</p> <p>8 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II Inorganic Chemistry

Course Code: ICC-505

Title of the Course: Experiments in Inorganic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses ICC-401, ICC-402 and ICO-401 at M. Sc.-I level	No. of lectures
Course Objectives:	1. To introduce to practical knowledge in Inorganic Chemistry. 2. To learn techniques of crystallization of ligands and synthesis of coordination compounds 3. To learn characterization of compounds using different instruments 4. To provide experience of synthesis and characterization of materials 5. To introduce analysis of ores for metal content	
Course Outcomes:	1. Students will be in a position to understand general aspects involved in purification of ligands and synthesis of coordination of compounds 2. Students will be able to understand the methods for characterization of coordination compounds. 3. Students will be in a position to understand the solid state material synthesis and characterization. 4. Students will be able to separate metal ions by ion exchange chromatography. They will also gain knowledge about the analysis of ores and alloys	
Content:	<p>EXPERIMENTS IN INORGANIC CHEMISTRY <i>Total sixteen experiments to be performed from the following.</i></p> <p>Group – 1: Experiments in coordination chemistry: Ligand and complex synthesis, metal analysis (Minimum 3)</p> 1) Purification (distillation / recrystallization) of ligands like acacH, en, carboxylic acids etc) 2) Preparation of manganic tris(acetylacetonate) and estimation of manganese 3) Preparation of tris(thiourea) copper(I) sulfate and estimation of copper 4) Preparation of isomers; <i>cis</i> & <i>trans</i> dichloro-(ethylenediamine)-cobalt(III) chloride and estimation of cobalt 5) Preparation and resolution of tris(ethylenediamine)cobalt(III) ion and estimation of chloride 6) Preparation of <i>cis</i> and <i>trans</i> - potassium dioxalatodiaquo-chromate(III) and estimation of chromium 7) Preparation of nitro and nitrito-penta aminecobalt(III)chlorides and estimation of cobalt 8) IR spectral characterization of free ligands and coordinated ligands	18

	<p>9) Single crystal structure analysis <i>NOTE: In complex synthesis, the student is expected to recrystallize the product, record IR spectra and carry out metal analysis. Spectral analysis can be carried over.</i></p> <p>Group –2 Experiments in Solid State Chemistry (Minimum 3) 1) Preparation of spinel oxides by precursor method and estimation of metals in precursors and oxides, 2) Characterization of precursors by thermal analysis and infrared analysis 3) X-ray diffraction studies of oxides 4) Electrical characterization: i) Direct current electrical resistivity of semiconductor (Ge/Si) by Four Probe 4) Curie temperature determination of dielectric material (PZT) by measurement of dielectric constant v/s temperature 5) Measurement of magnetization parameter: M_s, M_r and H_c, 6) Determination of Curie temperature of magnetic oxides by A.C. susceptibility studies.</p> <p>Group – 3: Instrumental methods / spectral analysis / ion exchange (Minimum 3) A) Determination of stability constant of complex ions in solution 1) Fe(III) – thiocyanate compound B) Determination of instability constant of complex ions in solution 2) Determination of instability constant for the reaction between Ag^+ and NH_3 3) Determination of instability constant for the reaction between Ag^+ and en 4) Determination of instability constant for the reaction between Cu^{2+} and NH_3 5) Determination of instability constant for the reaction between Cu^{2+} and en C) Ion exchange chromatography 6) Separation of Mg^{2+} and Co^{2+}/Zn^{2+} by anion exchange column 7) Separation of transition metal cations by anion exchange column</p> <p>Group – 4: Ore / Alloy/ commercial sample analysis (Minimum 3) 1) Analysis of Goan Iron ore: Hematite / magnetite 2) Analysis of Devardas alloy 3) Analysis of Solder (Pb and Sn) 4) Analysis of Calcite/ Dolomite 5) Analysis of Pyrolusite 6) Analysis of Nickel-Aluminium alloy 7) Analysis of Brass / Bronze</p>	<p>18</p> <p>18</p> <p>18</p>
Pedagogy	Pre-labs, practical / self-study or a combination of some of these could also be used to some extent.

Programme: **M. Sc. Part-II (Inorganic Chemistry)**

Course Code: **ICO-501**

Title of the Course: **Bioinorganic Chemistry**

Number of Credits: **03**

Effective from AY: **2019-20**

Prerequisites for the course:	The students who have done MSc-I Chemistry core courses are eligible to attend	No. of lectures
Course Objectives:	1. To introduce, describe and highlight the role of inorganic elements especially metal ions in biology. 2. To describe the role of small molecular weight model compounds.	
Course Outcomes:	In addition to knowing the essential elements in biology the students will be able to understand the role played by metal ions in vital processes like i) oxygen storage and transport and ii) electron transfer.	
Course Content:	1. Essential elements in biology, distribution of elements in biosphere, bio-availability, bio-stability, building blocks of the biosphere; carbohydrates, nucleic acids and proteins, Biological importance of water, and brief review of the chemistry of biopolymers. Metallobiomolecules: classification of metallobiomolecules, metalloproteins (enzymes), metal activated proteins (enzymes), metal functions in metalloproteins, Principles of coordination chemistry related to bioinorganic research, physical methods in bioinorganic chemistry	6 hr
	2. Introduction, biological importance of the alkali and the alkaline earth cations, Cation transport through membranes (ion pumps). Photosynthesis, Hill reaction, Chlorin macrocycle and chlorophyll, Absorption of light by chlorophyll, role of metals in photosynthesis, in vitro photosynthesis.	6 hr
	3. Non redox metalloenzymes, zinc metalloenzymes like carboxypeptidase, carbonic anhydrase and alcohol dehydrogenase, Bio-functions of zinc enzymes, active site structure and model complexes.	6 hr
	4. Biochemistry of a few transition metals viz. Fe, Mo, Cu and Ni, Oxygen carriers and oxygen transport proteins, iron porphyrins (Haemoglobin and myoglobin). Haemocyanins and Haemerythrins, Synthetic models for oxygen binding haemproteins. cytochrome 'c', catalase peroxidase, and superoxide dismutase, blue copper proteins, vitamin B ₁₂ coenzymes, nitrogen fixation and iron-sulfur proteins, biological nitrogen fixation, nitrogenase and dinitrogen complexes, iron-sulfur proteins, synthetic analogues for Fe-S proteins, core extrusion reactions.	6 hr 6 hr

	<p>5. Metal transport and storage: A brief review of iron transport.</p> <p>6. Synthesis of simple ligands or isolation of S-containing amino acid or extraction of chlorophyll from green leaves (this will involve both collection of synthetic procedures from library, term paper presentation / discussion)</p>	
Pedagogy	Mainly lectures / tutorials / assignments /group discussion / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICO-502

Title of the Course: Catalysis: The Basic chemical concepts

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with Chemistry back ground are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To understand fundamentals concepts of chemical reactions over the catalysts.2. To understand energy saving and making green processes in chemical reactions.3. To understand fundamentals concepts of chemical reactions for developing higher productivity, mechanisms and viability.4. To provide knowledge on applications of heterogeneous, homogenous and other catalytic processes.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the green chemical processes.2. They will be well equipped with the knowledge of catalytic reactions.3. They will be in position to understand the reaction mechanism process.4. The concepts of catalytic reactions will be cleared to them.5. They will know the applications of catalyst compounds in chemical reactions and industries.	
Content:	<p>1. Origin and development of catalysis; Difference between heterogeneous, homogeneous, auto and photocatalysis, Importance of heterogeneous and homogeneous catalysts in chemical reactions.</p> <p>2. Heterogeneous Catalysis:</p> <ol style="list-style-type: none">i. Adsorptions: Physical and chemical adsorption, dissociative adsorptions, simple adsorptions isotherm, Langmuir adsorption and the BET adsorption isotherm.ii. Types of Catalysts; Preparations of the Catalysts, nano-materials, significance of zeolites and supported catalysts.iii. Characterization of solid catalysts: Surface area, structure and surface morphology, X-ray diffraction, SEM, TEM, X-ray absorption spectroscopy, XPS and Auger spectroscopy to surface studies.iv. Activity and life of the catalysts, active centers, promoters and poisons, catalyst deactivations.v. Heterogeneous reactions: Thermodynamic consideration in surface reactions, ammonia synthesis, oxidation reduction reactions (selected examples), mechanism of catalytic reactions, method of finding rate of the reactions and the rate determining steps.vi. Theories of Catalysis: Boundary layer theory, Catalysis by semiconductors, Wolkenstein theory, Balancing's approach,	<p>2 hr</p> <p>17 hr</p>

	<p>electronic factors is catalysis by metals.</p> <p>3. Homogeneous Catalysis: Intermediate stages in homogenous Catalysis, energy profile diagram, general scheme for calculating kinetics of reactions, decomposition of hydrogen peroxide, acid-base catalysis, hydrogenation, Mosanto acetic acid, Carboxylation reaction and Wacker reaction.</p> <p>4. Introduction to followings: Photocatalysis, catalytic polymerizations, phase transfer catalysis and biocatalysis with suitable examples.</p> <p>5. Catalysts for energy and environmental: Catalytic gasification, steam reforming, fuel cells and auto-industrial emission control.</p>	<p>7 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICO-503

Title of the Course: Chemistry of P-Block Elements

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICO-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of P-Block Elements	No. of Lectures
Course Objective:	To provide basic and advanced knowledge about P-Block elements, their compounds and complexes.	
Course Outcome	This course will give sufficient information about the periodic table in general and P-Block elements and their compounds in particular.	
Content:	1. General trends of different properties in groups and periods in periodic table	2 hr
	2. Chemistry of Group 13 Elements and their Compound 2.1 Introduction, physical properties, chemical reactions with oxygen, nitrogen, sulphur, halogens, HCl, NaOH, NH ₃ , mono-di-tri-chlorides, alums, organo-compounds of B and Al, difference between boron and other Gr. 13 elements, diagonal relationship. 2.2 Preparation, bonding and structure of diborane, higher boranes, borane anions, carboranes and metallocarboranes.	9 hr
	3. Chemistry of Group 14 Elements and their Compound 3.1 Introduction, physical properties, compound of Gr.14: Oxides, di & tetra halides, hydrides, sulphides, complexes of Gr. 14, organosilicon compounds (except silicones), cluster compounds of Ge, Sn and Pb. 3.2 Carbon dating, graphene, metallocarbohedrenes, freons.	5 hr
	4. Chemistry of Group 15 Elements and their Compound 4.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides; 4.2 Preparation, properties and structure of Phosphorous: Oxides, oxyacids, sulphides, oxosulphides; organophosphorous compounds. 4.3 Classification, preparation, properties and structures of phosphazenes.	5 hr
	5. Chemistry of Group 16 Elements and their Compound 5.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides, oxides (except sulphur), oxyacids (except sulphur), classification of oxides. 5.2 Polyatomic sulphur cations, anionic polysulphides, compounds with sulphur as a ligand.	6 hr

	<p>6. Chemistry of Group 17 Elements and their Compound</p> <p>6.1 Introduction, physical properties; preparation, properties and structure of: Oxides, oxyacids, halides, oxohalides, hydrogenoxide fluorides and related compounds.</p> <p>6.2 Preparation, properties and structure of: Polyhalide anions, polyhalonium cations, halogen cations.</p> <p>7. Chemistry of Group 18 Elements and their Compound</p> <p>7.1 Introduction, physical properties; preparation, properties and structure of xenon compounds (fluorides and oxides); organoxenon compounds, coordination compounds.</p> <p>7.2 Preparation, properties and structure of compounds of other noble gases.</p>	<p>6 hr</p> <p>3 hr</p>
Pedagogy:	Mainly lectures/ tutorials/ assignments /seminars/ presentations/ self-study or a combination of some of these could be used to some extent. Sessions shall be fractionally interactive in nature.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-502

Title of the Course: Reaction Mechanisms, Stereochemistry and Asymmetric Synthesis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry at T Y B Sc (Chemistry) and M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction to important principles of stereochemistry such as Baldwin's rules.2. Understand the importance of chirality in organic syntheses.3. Learn about non-catalytic asymmetric synthesis methods in the classical chemistry involving alkenes and carbonyl compounds.4. Analyse and understand mechanistic aspects for fundamental reactions studied at TYBSc/ MSc Part I levels.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in position to understand the importance of asymmetric synthesis in organic reactions.2. Students should be in position to understand to apply various principles of stereochemistry and understand the mechanistic aspects of fundamental reactions.	
<u>Content:</u>	<p>I. Reaction Mechanisms-</p> <p>1. Intramolecular Reactions (Baldwin's Rules)</p> <p>2. Molecular rearrangements and their synthetic applications</p> <p>2.1 Unifying principles and mechanisms of rearrangements taking place at an electron deficient and electron rich substrates.</p> <p>2.2 Rearrangements taking place at carbon: Arndt Eistert, Wagner Meerwein, benzil-benzilic acid, Pinacol, semipinacol, Tiffeneau Demjanov, dienone phenol, Wittig, Favorskii, Stevens, Wolff, Baker-Venkatraman rearrangement, Barton decarboxylation, Pummerer rearrangement.</p> <p>2.3 Rearrangements at nitrogen: Hofmann, Curtius, Lossen, Schmidt, Beckmann, Neber, Stieglitz rearrangement.</p> <p>2.4 Rearrangements at oxygen: Payne (including aza and thia Payne) rearrangement, hydroperoxide rearrangement, Criegee rearrangement.</p> <p>2.5 Aromatic rearrangements: Benzidine, Fries, Von Richter, Sommelet-Hauser, Smile's, Jacobsen. Rearrangement on aniline derivatives- Bamberger rearrangement, Fischer-Hepp, Orton, Hofmann-Martius,</p>	<p>02 hours</p> <p>07 hours</p>

	<p>Reilly-Hickinbottom, rearrangements of N-aryldiazonitrenes, Phenylhydrazines, Phenylhydrazones.</p> <p>2.6 Rearrangements involving fragmentations: Eschenmoser fragmentation.</p> <p>II Stereochemistry</p> <p>1.1 Stereoselectivity in cyclic compounds</p> <p>(1) Introduction</p> <p>(2) Stereochemical control in six membered rings</p> <p>(3) Reactions on small rings</p> <p>(4) Regiochemical control in cyclohexene epoxides</p> <p>(5) Stereoselectivity in bicyclic compounds</p> <p>1.2 Conformations, stability and reactivity of fused ring compounds</p> <p>1.2.1 Fused bicyclic systems with small and medium rings:</p> <p>(1) Bicyclo [4.4.0] decanes (cis- and trans-decalins)</p> <p>(2) cis- and trans- decalones and decalols</p> <p>(3) Octahydronaphthalins (octalins)</p> <p>(4) Bicyclo [4.3.0] nonane (cis- and trans-hydrindanes)</p> <p>1.3 Fused polycyclic systems</p> <p>(1) Perhydrophenanthrenes</p> <p>(2) Perhydroanthracenes</p> <p>(3) Perhydrocyclopentenophenanthrene system (steroids, triterpenoids and hormones). Conformations and reactivity towards esterification, hydrolysis, chromium trioxide oxidation, ionic additions (of X_2) to double bonds, formation and opening of epoxide ring, epoxidation by peroxy acids.</p> <p>1.4 Spirocyclic compounds</p> <p>1.5 Reactions with cyclic intermediates or cyclic transition states</p> <p>2. Conformation of bridged ring compounds</p> <p>2.1 Bicyclo [2.2.1] heptane (norbornane)</p> <p>(1) Geometry and topic relationship of hydrogens.</p> <p>(2) Solvolysis of bicyclo[2.2.1]heptyl systems, formation, stability and reactivity of norbornylcation.</p> <p>(3) Relative stability and the rate of formation of <i>endo</i> and <i>exo</i> isomers in both bornane and norbornane systems.</p> <p>2.2 Bicyclo [2.2.2] octane system</p> <p>(1) Geometry and topic relationship of hydrogens</p> <p>(2) Solvolysis of bicyclo[2.2.2]octyl system.</p> <p>2.3 Other bridged ring systems: starting from bicyclo[1.1.1]pentane to bicyclo[3.3.3]undecane</p> <p>2.4 Bicyclo system with heteroatom: the relative stabilities of</p>	<p>8 hours</p> <p>4 hours</p>
--	---	-------------------------------

	<p>tropine, pseudotropine and benzoyl derivatives of norpseudotropine.</p> <p>3. Dynamic Stereochemistry: Stereoselective Reactions</p> <p>3.1 Stereoselectivity: classification, terminology and principle. Selectivity in chemistry– substrate and product selectivity.</p> <p>3.2 Stereoselective reaction of cyclic compounds: Introduction, reactions of four, five and six-membered rings. Conformational control in the formation of six-membered ring.</p> <p>3.3 Diastereoselectivity: Introduction, making single diastereoisomers using stereospecific reactions of alkenes.</p> <p>3.4 1,2-Addition to carbonyl compounds: Predicting various addition outcomes using different predictive models such as, Cram Chelate, Cornforth, Felkin-Anh. Specific reactions: allylation/crotylation by Brown, Roush, BINOL catalyzed.</p> <p>3.5 Stereoselective reaction of acyclic alkenes: The Houk model</p> <p>4. Asymmetric synthesis</p> <p>4.1 Chiral pool (chiron approach)</p> <p>4.2 Chiral auxiliary approach Oxazolidinone & norephedrine-derived chiral auxiliary controlled Diels-Alder reaction and alkylation of chiral enolates and aldol reaction, Alkylation using SAMP and RAMP</p> <p>4.3 Chiral Reagents (Use of (-)-sparteine)</p> <p>4.4 Asymmetric catalysis CBS catalyst, Ruthenium catalyzed chiral reductions of ketones, Catalytic asymmetric hydrogenation of alkenes, Asymmetric epoxidation (Sharpless and Jacobson), Sharpless asymmetric dihydroxylation reaction Organocatalysed aldol reaction (Use of proline)</p> <p>5. Stereoisomerism due to axial chirality, planar chirality and helicity.</p> <p>5.1 Stereochemistry and configurational (R/S) nomenclature in appropriately substituted allenes, alkylidenecycloalkenes, spiranes, adamantoids, biaryls, trans-cycloalkenes, cyclophanes and ansa compounds.</p> <p>5.2 Atropisomerism in biphenyls and bridged biphenyls.</p>	<p>6 hours</p> <p>6 hours</p> <p>3 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-503

Title of the Course: Synthetic Methods in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. Part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various concepts related to making carbon-carbon bonds.2. To understand designing of organic synthesis to make molecules of interest.3. To plan total synthesis based on protection-deprotection strategy.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how a carbon-carbon bond can be constructed.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<p>1. Formation & reactions of enols and enolates.</p> <p>1.1. Keto-enol tautomerism: introduction, acidity, basicity concepts & pKa scale, neutral nitrogen and oxygen bases. Formation of enols by proton transfer, requirements for and mechanism of enolisation 51pprox.51d by acids & bases, types of enols & enolates, kinetically & thermodynamically stable enols, consequences of enolisation, stable enolate equivalents, preparation and reactions of enol ethers.</p> <p>1.2. Formation of Enolates: Introduction, preparation & properties, non-nucleophilic bases, E / Z geometry in enolate formation, kinetic vs. thermodynamic control, other methods for the generation of enolates, issue of enolate ambidoselectivity.</p> <p>1.3. Alkylation of enolates: diverse reactivity of carbonyl groups, alkylation involving nitriles and nitroalkanes, choice of electrophile for alkylation, lithium enolates of carbonyl compounds and alkylation, specific enol equivalents to alkylate aldehydes and ketones, alkylation of β-dicarbonyl compounds, problem of regioselectivity during ketone alkylation and the remedy provided by enones.</p> <p>1.4. Reaction of enolates with aldehydes and ketones: introduction, aldol reaction including cross & intramolecular version, enolizable substrates which are not electrophilic in nature, controlling aldol reactions with specific enol equivalents, specific enol equivalents for carboxylic acids, aldehydes and ketones.</p> <p>1.5. Acylation at carbon: Introduction, the Claisen ester condensation (intramolecular and inter / crossed),</p>	18 hours

	<p>acylation of enolates by esters, preparation of keto-esters by the Claisen reaction, directed C-acylation of enols and enolates & acylation of enamines.</p> <p>1.6. Conjugate addition of enolates: Introduction, thermodynamic control vs. conjugate addition, utility of various electrophilic alkenes in conjugate addition, formation of six-membered rings <i>via</i> conjugate addition and nitroalkanes as versatile synthons.</p> <p>1.7. Examples pertaining to the application of following condensation reactions in organic synthesis: Mukaiyama reaction, Perkin reaction, Dieckmann condensation, Knoevenagel condensation & Doebner modification, Stobbe condensation, Darzen's glycidic ester condensation, Michael addition, Robinson annulation, and the Sakurai reaction.</p>	
	<p>2. Synthetic utility of the following name reactions / methodology with specific examples:</p> <p>2.1 Mannich Reaction, Nef Reaction, Mitsunobu and Appel Reaction, Baylis Hillman reaction, Mc. Murry coupling, vicarious nucleophilic substitution, Steglich and Yamaguchi esterification, Ring closing and cross metathesis: Grubb's various generation, Grubbs-Hoveya, Schrock catalysts- Scope and challenges in terms of ring sizes as well as FG tolerance.</p>	6 hours
	<p>3. The Ylids in Organic Synthesis.</p> <p>3.1. Phosphorus Ylids: Nomenclature and Preparation. Wittig olefination: mechanism, stereoselectivity, cis- and trans-selective reactions, Wittig reagents derived from α-halo carbonyl compounds,</p> <p>3.2 Modified Wittig, Horner – Wadsworth – Emmons, Stille-Gennari modification with achiral and chiral substrates, Peterson reaction, Julia Olefination.</p> <p>3.3. Sulfur Ylids: sulfonium & sulfoxonium ylids in synthesis, diphenylcyclopropyl sulfonium ylids & their reactions with carbonyl compounds / Michael acceptors.</p>	6 hours
	<p>4. Protecting Groups in Organic Synthesis.</p> <p>4.1. Introduction, when are Protecting Groups needed? Effective use of protective groups. Umpolung of reactivity & protecting groups.</p> <p>4.2. Common protective groups namely acetals & ketals, ditho acetal/ketals, trialkylsilyl, TBDMS, THP, -OMPM, MOM, MTM, MEM, SEM & benzyl ether, methyl ether, benzyl amine, Cbz, t-Boc, Fmoc, t-butyl ester and methods for deprotection. Examples of multistep synthesis using</p>	6 hours

	protection-deprotection procedures.	
Pedagogy:	Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-504

Title of the Course: Pericyclic and Organic Photochemical Reactions.

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses/topics in Synthetic Organic Chemistry & organic spectroscopy at M Sc Part-I level.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of various concepts in pericyclic chemistry based on molecular orbital theory.2. Introduction of analysis of pericyclic reactions using theoretical concepts.3. Learning mechanistic aspects of pericyclic & photochemical reactions in organic synthesis.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict course of given pericyclic reaction using the theoretical concepts.2. Students should be in a position to apply various to understand stereochemical output in a reaction.3. Students shall be in a position to understand/propose plausible mechanism of pericyclic/photochemical reactions.	
<u>Content:</u>	<p>1. Pericyclic Reactions Theory of pericyclic reactions- a) Frontier Molecular Orbital (FMO) theory b) Transition state aromaticity (Möbius-Hückel theory) concept c) Orbital correlation diagram method Analysis of pericyclic reactions (including stereochemistry) using the above concepts a) Cycloaddition reactions b) Electrocyclic reactions c) Sigmatropic rearrangements (Note: Various important features to be discussed taking examples of well-known reactions of each type) Some synthetically useful reactions (theory and examples) a) 1, 3-dipolar additions (Application of FMO theory and examples) b) [3, 3] Shifts; Claisen and Cope rearrangements and fluxional molecules, c) ene reaction, retro-Diels-Alder reactions.</p> <p>2. Organic Photochemistry a) Principles of energy transfer, theoretical concepts in organic photochemistry w. r. t.</p>	<p>24 hours</p> <p>12 hours</p>

	<p>cycloadditions, electrocyclic reactions etc.,</p> <p>b) Some photochemical reactions of alkenes, dienes, carbonyl compounds and arenes including the following- Cis-trans isomerization and photostationary equilibrium; Paterno-Buchi reaction ; Norrish Type cleavages; Di-pi methane rearrangement; bicycle rearrangement</p> <p>c) Reactions involving singlet and triplet oxygen</p>	
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-505

Title of the Course: Organic mixture separation and identification

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M. Sc. Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic separations.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Separation of organic components based on solubility. 2. Separation of organic components based on functionality. 3. Separation of organic components based on boiling points. 4. Distillation, recrystallization and derivatisation. 5. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.	
<u>Content:</u>	Three component mixture separation based upon differences in the physical and the chemical properties of the components. Elemental and functional group analysis and determination of physical constants of the individual compounds. Derivative preparation, its recrystallization and m. p. of each component and characterization of each component and its derivative by m. p. comparison. (Minimum 12 experiments of 6h each.) Assessment to be done through a 6hr examination comprising of an experiment emphasizing separation of mixture, elemental analysis of all three components and preparation of derivative of any one component suggested by examiner and recording of the physical constants and an oral assessment.	72 hours
<u>Pedagogy:</u>	Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-501

Title of the Course: Chemistry of Natural Products

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on stereochemistry, spectroscopy and synthetic organic chemistry at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	1. To study the main classes of natural products. 2. To understand the different methods that are used in natural product chemistry, including extraction, isolation and structural elucidation. 3. To understand the key biosynthetic pathways for the biosynthesis of terpenes, alkaloids and steroids.	
<u>Course Outcome</u>	3. Students should able to identify different types of natural products, their occurrence, structure biosynthesis and properties. 4. Students should able to carry out independent investigations of plant materials and natural products.	
<u>Content:</u>	1. General methods of purification and structure elucidation of Natural Products 1.1 General methods of isolation-The modern distillation process, maceration, enfleurage, extraction by cold pressing and extraction with solvents. 1.2 Fractionation of the crude extracts and purification of the individual compounds from the respective fractions using chemical and chromatographic techniques such as Column Chromatography, TLC, Preparative TLC, HPLC, etc. 1.3 Chemical methods based on the functional groups present. Bicarbonate extraction, sodium bisulphite adduct formation, derivatization, etc. 1.4 General approach to structure elucidation of the isolated pure compounds using UV, IR, NMR spectroscopy, MS spectrometry, optical polarimetry.	5 hours
	2. Structure elucidation by classical chemical methods 2.1 Terpenoids: α -cedrene 2.2 Alkaloids: Morphine, thebaine and codeine 2.3 Steroids: Cholesterol, bile acids	6 hours
	3. Structure elucidation by combination of chemical and spectral methods 3.1 Terpenoids: α - and β -vetivones, Ishwarone 3.2 Hormones: Cecropia Juvenile hormone, brevicomin and frontalinal 3.3 Oxygen heterocycles: Aflatoxin-B1, rotenone	8 hours

	4. Structure elucidation involving stereochemistry, spectral and Chemical methods 4.1 Terpenoids: Menthol and hardwickiic acid 4.2 Alkaloids: Reserpene	4 hours
	5. Synthesis of selected Natural Products, planning and execution 5.1 Terpenoids: Longifolene (E J Corey), Caryophyllene (E J Corey) Nootkatone (A Yoshikoshi), Menthol (Tagasago) 5.2 Alkaloids: Reserpine (R B Woodward), Morphine (Marshall Gates) 5.3 Hormones: Cecropia JH (Edward), Progesterone 5.4 Prostaglandins: Prostaglandin E ₂ (E J Corey) 5.5 Antibiotics: Cephalosporin (R B Woodward)	8 hours
	6. Biogenesis and biosynthesis of Natural Products 6.1 Terpenoids and Steroids: General approach towards biosynthesis of mono-, sesqui-, di-, tri-, tetraterpenoids and steroids through mevalonate pathway with special reference to the biosynthesis of terpenoids and steroids included in topics 3 to 6 6.2 Alkaloids: The shikimate pathway formation of hydroxybenzoic acid derivatives, aromatic amino acids, L-phenylalanine, L-tyrosine, phenolic oxidative coupling, biosynthesis of thebaine, codeine and morphine.	5 hours
<u>Pedagogy:</u>	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-503

Title of the Course: Introduction to Medicinal Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry and spectroscopy at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	4. Study of drugs and drug development. 5. Introduction to the concepts and processes of drug discovery, delivery, absorption and metabolism. 6. It also provides brief introduction to pharmacology, pharmacokinetics and pharmacodynamics.	
<u>Course Outcome</u>	1. Understand the historical and advanced concepts of medicinal chemistry and its advantages 2. Identify the medicinal properties of different organic molecules.	
<u>Content:</u>	1. Introduction to Drugs 1.1. Requirement of an ideal drug 1.2. Sources of drugs 1.3. Important terms used in chemistry of drugs 1.4. Classification and nomenclature of drugs	5 hours
	2. Drug Design 2.1. Analogues and pro-drugs 2.2. Concept of lead compounds 2.3. Features governing drug design – The method of variation, drug design through disjunction, conjunction, tailoring of drugs 2.4. Cimetidine – a rational approach to drug design.	5 hours
	3. Drug Development and drug action 3.1. Screening of natural products, isolation and purification, structure determination 3.2. Structure-activity relationship, QSAR, Synthetic analogues 3.3. Natural Products as leads for new pharmaceuticals 3.4. Receptor theories 3.5. Oxaminiquine – a case study. 3.6 Mechanism of drug action. 3.6. Introduction 3.7. Enzyme stimulation 3.8. Enzyme inhibition 3.9. Sulfonamides	8 hours
	4. Study of the following class of major drugs: 4.1. Pharmacodynamic Agents. a) Local anaesthetics b) Analgesics: Narcotic and non-steroidal anti-inflammatory,	8 hours

	<p>narcotic antagonists (Mechanism of Action and Synthesis of Ibuprofen)</p> <p>c) Antiepileptic drugs</p> <p>d) Antiparkinsonism drugs</p> <p>e) Antihistaminics (SAR and synthesis of chlorpheniramine) f) Sedatives and hypnotics (Mechanism of Action of and synthesis of Phenobarbital)</p> <p>g) Antipsychotics</p> <p>h) Cardiovascular agents: Cardiovascular diseases, Antianginal agents and vasodilators, Antihypertensive agents, Antiarrhythmic drugs, Adrenergic blocking agents (Mechanism of Action of Methyl Dopa and synthesis of Propranolol)</p> <p>i) Antihyperlipidemic and antiatherosclerotic agents</p> <p>j) Anticoagulants, blood coagulation and anticoagulant mechanism</p> <p>k) Diuretics</p> <p>l) Drugs and diabetes: Synthetic hypoglycemic agents.</p> <p>5.1 Chemotherapeutic Agents.</p> <p>a) Sulfonamides (Mechanism of Action of sulphonamides) b) Antitubercular and Antilepral agents (Mechanism of Action of p-Aminosalicylic acid and Dapsone) SAR of Dapsone</p> <p>c) Antiamoebics (Mechanism of Action of Metronidazole) d) Anthelmintics</p> <p>e) Antimalarials</p> <p>f) Antiviral agents</p> <p>g) Antineoplastic Agents</p> <p>Synthesis of Dapsone sulphacetamide Isoniazid Metronidazole</p> <p>5.2. Antibiotics : General information, mode of action and application of:</p> <p>a) β-Lactam antibiotics: Penicillins and Cephalosporins</p> <p>b) Aminoglycosides: Streptomycin, Neomycin</p> <p>c) Tetracyclines</p> <p>d) Macrolides: Erythromycin, Rifamycin</p> <p>e) Lincomycin</p> <p>f) Polypeptides: Bacitracin</p> <p>g) Unclassified antibiotic: Chloramphenicol (SAR and Synthesis)</p>	<p>4 hours</p> <p>6 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-504

Title of the Course: Retrosynthesis in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels and part II organic level CHOC-501, 502, 503 and 504 courses.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various logical steps related to planning of organic synthesis.2. To apprehend the complexity of synthesis of complex organic molecules.3. To apply the knowledge gained in organic synthesis for making new molecules.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how retrosynthesis can be used in finding out easily available chemical precursors for making organic molecules.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<ol style="list-style-type: none">1. Introduction to disconnection2. One-Group disconnection<ol style="list-style-type: none">2.1 Disconnection of simple alcohols2.2 Compounds derived from alcohols.2.3 Review problems.2.4 Disconnections of simple olefins2.5 Disconnection of aryl ketones2.6 Control2.7 Disconnection of simple ketones and acids2.8 Summary and revision3. Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-505

Title of the Course: Heterocyclic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels, part II organic level CHOC-501, 502, 503 and 504 courses and must be simultaneously studying CHOO-503 and 504, courses.	
<u>Course Objective:</u>	1. Understand the fundamentals of heterocyclic chemistry 2. Knowledge of synthesis of heterocycles.	
<u>Course Outcome</u>	1. Understand the reactivity of heterocycles towards electrophilic, nucleophilic, reducing and oxidizing reagents. 2. Knowledge of synthesis of heterocycles.	
<u>Content:</u>	1. Introduction, classification and Nomenclature of mono- and bicyclic heteroaromatic molecules	04 hours
	2. Physical properties, dipole moment, acidity-basicity, Aromaticity electron density distribution and reactivity of- 2.1 Furan, Thiophene, Pyrrole, Indole 2.2 Pyridine, Pyridine-N-oxide 2.3 Quinoline and isoquinoline 2.4 Diazines and triazines 2.5. 1,3- and 1,2- azoles	20 hours
	3. Synthetic strategies based on retrosynthetic approach: General methods of synthesis of the following- 3.1 Furan, Thiophene, Pyrrole, Indole 3.2 Pyridine, Quinoline and isoquinoline 3.3 Chromones	12 hours
<u>Pedagogy:</u>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-506

Title of the Course: Introduction to Polymer Chemistry-I: Basic Concepts

Number of Credits: 03

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses in Organic Chemistry at T. Y. B Sc. and M. Sc. Part-I levels.	
<u>Course Objective:</u>	Introduction to various concepts in organic polymer chemistry.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the differences in structures and properties of small molecules and macromolecules.2. The students will be in a position to understand concepts involved in polymer synthesis and characterization.	
<u>Content:</u>	1. Brief history of natural and synthetic polymers: Classification & nomenclature of polymers, Functionality concept- linear, branched and cross-linked polymers. Introduction to biodegradable polymers.	07 hours
	2. Methods and Chemistry of polymerization: Bulk, solution, suspension, emulsion, addition, condensation polymerizations. Free-radical, Ionic and co-ordination polymerization reactions and copolymerization. Introduction to controlled free radical polymerization. Carothers equation in condensation polymerizations.	12 hours
	3. Some properties of polymers: Number and weight average molecular weights, Molecular weight distribution, polydispersity, Glassy state and glass transition temperature, crystallinity in polymers. Introduction to characterization of polymers.	10 hours
	4. Additives in polymers: Lubricants, plasticizers, stabilizers, antioxidant, fire retardants, blowing agents, fillers, colorants, crosslinking agents, UV-Vis degradants etc., (properties and examples)	07 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-507

Title of the Course: Introduction to Polymer Chemistry-II: Synthesis of Polymers and Processing

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the course entitled- Introduction to polymer Chemistry-I: Basic Concepts	
<u>Course Objective:</u>	Introduction to various concepts involved in the synthesis and processing of organic monomers and polymers.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the synthetic methodology and applications of various monomers and polymers.2. The students will be in a position to understand concepts involved in polymer processing.	
<u>Content:</u>	<ol style="list-style-type: none">1. Resources for monomers, manufacture of some important monomers and reagents: Ethylene, propylene, butadiene, isoprene, styrene, divinyl benzene, acrylates, acrylonitrile, vinyl chloride, formaldehyde, adipic acid, urea, bisphenol-A, melamine, terephthalic acid, phthalic anhydride, dimethyl terephthalate, glycol, glycerol, ethylene oxide, epichlorohydrin, ϵ-caprolactum, di-isocyanates, pentaerythritol, allylic carbonate monomers.	14 hours
	<ol style="list-style-type: none">2. Synthesis, properties and applications of certain polymers: Vinyl polymers- LDPE, HDPE, PVC, PVA, polyvinyl acetate, polyacrylates, methacrylates, polystyrene, teflon, ABS, SBR, SAN. Condensation polymers- Nylons, polyesters, polyurethanes, polycarbonates. Thermoset polycarbonates like CR-39 Cellulose esters- cellulose acetate, nitrates and acetate-butyrate. Natural rubber, Thermoset resins- phenol-formaldehyde, resols and novolacs, melamineformaldehyde, urea-formaldehyde, epoxy resins - their curing.	14 hours
	<ol style="list-style-type: none">3. Polymer processing – Introduction to compounding, and processing techniques like calendaring, casting, moulding and spinning in polymer processing.	08 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry)

Course Code: OCO-508

Title of the Course: Selected Experiments in Organic Chemistry-I

Number of Credits: 4

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M Sc Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Stoichiometric requirements during organic syntheses. 2. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents. 3. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of microwave, photochemistry, low temperature synthesis etc. 4. Use of organic spectroscopic techniques in monitoring the organic syntheses.	
<u>Content:</u>	(Group A: minimum 8 experiments) 1. Dimedone from mesityl oxide (Dieckmann condensation). 2. 1,2,3,4-tetrahydrocarbazole from cyclohexanone (Fisher indolisation reaction). 3. o-Chlorobenzylidene rhodanine (Perkin reaction). 4. Diels- Alder reaction of anthracene and maleic anhydride using microwave irradiation. 5. Oxidation of a primary / secondary alcohol to carbonyl compound by polymer supported chromic acid (Amberlyst A - 26, chromate form). 6. Phenytoin from benzil and urea. 7. Use of protecting groups: Synthesis of 1,1-diphenylbut-1-en-3-one 1) Ethyl acetoacetate ethylene acetal. 2) 1,1-Diphenyl -1-hydroxy-3- butanone ethylene acetal. 3) 1,1-Diphenyl -1-hydroxy- 3-butanone. 4) 1,1-Diphenylbut-1-en- 3 -one. 8. Isoborneol from camphor (NaBH ₄ reduction) 9. 3 -Methyl -2-phenyl-2-butanol from 2-bromopropane and acetophenone 10. Friedel- Crafts acylation of anisole.	48 hours

	<p>11. Diethyl 4- butyl malonate by malonic ester condensation</p> <p>(GROUP B: minimum 8 experiments)</p> <ol style="list-style-type: none"> 1. Epoxidation of cholesterol or related compounds 2. 2,2 - dichloro bicyclo (4.1.0) heptane from cyclohexene and dichloro cabene using PTC. 3. Reduction of Nitrobenzene to aniline by Sn / HCl. 4. 2 - methyl benzimidazole from o-phenylene diamine. 5. Benzophenone oxime to benzanilide (Beckmann rearrangement). 6. Ferric chloride oxidative coupling of 2-naphthol: 2,2'- dihydroxy dinaphthyl 7. Dicoumarol from coumarin derivative. 8. LAH reduction of Anthranilic acid. 9. Norborneol to norcamphor using chromiurn trioxide/sulfuric acid 10. Halogenation using NBS: preparation of 9-bromoanthracene (or benzylic bromides) 11. Benzhydrol from benzaldehyde (Grignard reaction) 12. Ethyl n-butyl acetoacetate by acetoacetic ester condensation <p>Note: Students are expected to use techniques like TLC, IR, GC for monitoring/ establishing purity, identity of the synthesized compounds.</p>	48 hours
<u>Pedagogy:</u>	<p>Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.</p> <p>The students are required to undertake pre-lab. and post – lab. assignment as instructed by the concerned teacher and the same may be evaluated by according suitable weightage as an ISA component while prescribing the mode of assessment.</p>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-509

Title of the Course: Chemistry of Life

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the basic of amino acid, fatty acid and types of carbohydrates at BSc (Chemistry)	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of types of amino acid and proteins2. Introduction of carbohydrates and lipids3. Understanding characteristics of proteins, carbohydrates & lipids and their applicability in daily life4. Understanding chemicals used in food production through food processing, storage and cooking.5. Understanding food analysis and the chemistry of the digestion of food and the energy provided by food.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict type of proteins, lipids and carbohydrates available in food.2. Students should be in a position to apply knowledge role of cooking in daily food.3. Students shall be in a position explore the chemical structure and functionality for the macronutrient categories like carbohydrates, lipids, and protein in food4. Student will be able to design experiments through an inquiry-oriented, food chemistry focused laboratory program.5. The students should be able to identify the essential chemical components of food and have knowledge of their analyses, gained a working knowledge of the chemistry of lipids, carbohydrates and proteins	
<u>Content:</u>	<p>1. Chemistry and Functionality of Proteins Major food proteins Structure, physical function in food Analysis: Proteins</p> <ol style="list-style-type: none">a) Introduction of amino acid and role of polar, non-polar, acidic and basic side chains and also their properties, and Isoelectric pointb) Introduction of peptide, dipeptides and proteins.c) Types of proteins (primary (1°), secondary (2°), tertiary, (3°) and Quaternary (4°)<ul style="list-style-type: none">• Hydrogen bonding between side chains• Salt Bridges between side chains• Hydrophobic - non-polar interactions• Disulfide linkaged) Protein folding, denaturation, functional properties of proteins.e) Food Proteins – Source of Nutrients and Analysis of proteins and amino acidsf) Other Methods used in the Study of Food Proteins <p>2. Chemistry and Functionality of Major Components of Food: Carbohydrates</p> <p>Introduction of Mono, di and oligosaccharides, starch, Dietary fibre and gums, their reactions and physical function in food and their analysis.</p>	<p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> a) Content in common foods b) Discuss Fischer projections, Haworth Projections, stereoisomerism c) Major reactions d) Sugars: Hydrolysis, thermal degradation, Maillard reaction (non-enzymic browning reaction between reducing carbohydrates and proteins) e) Starch retrogradation (staling of bread) f) Mutarotation g) Decomposition of sugars: Maillard Reaction (Maillard Browning), Amadori Rearrangement and Analysis of Sugars h) Discuss Fischer projections, Haworth Projections, stereoisomerism <p>3. Chemistry of Major Components of Food: Lipids</p> <ul style="list-style-type: none"> a) <i>Fats: Fats in nutrition to be discussed</i> b) <i>Classes of lipids, fatty acids,</i> c) <i>monoglycerides,</i> d) <i>diglycerides,</i> e) <i>triglycerides, polar</i> f) <i>lipids</i> g) <i>Reaction of fats- Oxidative and hydrolytic rancidity</i> h) <i>Analysis</i> i) <i>Fats in food- for e.g. Chocolate</i> j) Other Methods Used in the study of food lipids to be discussed 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Thermodynamics and Reaction Kinetics

Course Code: PCC-502

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce to classical & non-equilibrium thermodynamics. To introduce advances in reaction kinetics.	
Course Outcomes:	Students should be in a position to understand various concepts of thermodynamics and kinetics. Students should be in a position to apply the knowledge of thermodynamics and kinetics for their lab course in physical chemistry, dissertation and research work.	
Content:	2. Equilibrium Thermodynamics 1.1 Thermodynamic state functions. Exact and inexact differentials; partial derivatives. Maxwell relations. 1.2 Thermodynamic equations of state. Temperature and pressure dependence of Gibbs function. Gibbs-Helmholtz equation. Partial molar quantities. Free energy change accompanying a chemical reaction, chemical potential, Gibbs-Duhem equation. Duhem-Margules equation. 1.3 Entropy of mixing for gases and liquids. Gibbs paradox. 1.4 Thermodynamic derivation of phase rule.	9 hours
	2. Non-equilibrium Thermodynamics 2.1 Concept of internal entropy and spontaneity of a process in relation to free energy. Chemical affinity and extent of a reaction. Mass and energy balance equations. Entropy production in heat flow, chemical reactions and open system. 2.2 Postulates and methodologies, linear laws, Gibbs equations, Onsager's reciprocal theory. Validity of Onsager's equation and its verification. Application to thermo-electric and electro-kinetic phenomena.	9 hours
	3. Reaction Kinetics 3.1 Collision theory of reaction rates and treatment of unimolecular reactions. Theory of absolute reaction rates and its applications to reactions in solution. Thermodynamic study from reaction kinetics, comparison of results with Eyring and Arrhenius Equations. Solvent and salt effects; influence of ionic strength and solvent on the rates of reaction, primary and secondary salt effects. 3.2 Mechanism of photochemical, chain, coupled and Reversible reactions. Oscillatory reactions. Chemical Hysteresis in Belousov-Zhabotinskii reaction. 3.3 Fast reactions and study by stopped flow technique, relaxation method, pulse radiolysis, flash photolysis and magnetic resonance methods. 3.4 Homogeneous catalysis and Michaelis-Menten kinetics. Kinetic	18 hours

	<p>rate law for autocatalytic reactions. Kinetics of heterogeneous reactions, heterogeneous catalysis, inhibition, product induced and non-reactive inhibition.</p> <p>3.5 Potential energy surfaces and introduction to molecular reaction dynamics, theoretical calculation of energy of activation, chemical lasers.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<ol style="list-style-type: none"> 1. P.W. Atkins & J. De. Paulo, <i>Atkins' Physical Chemistry</i>, Oxford Univ. Press, 2007, 8th Ed. 2. J. Rajaram, J.C. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Electrochemistry and Surface Studies

Course Code: PCC-503

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce electrochemical processes such as ion-ion and ion solvent interactions. To introduce thermodynamics of electrochemical processes, kinetics of electrochemical reactions, electrochemistry of fuel cells, batteries and super capacitors.	
Course Outcomes:	Students should be in a position to understand various concepts of electrochemistry. Students should be in a position to apply the knowledge of electrochemistry for their dissertation and research work. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	3. Electrolyte Solutions 1.1 Ion-solvent interactions. Born Theory, validity and limitations. 1.2 Difference between solvation number and coordination number. 1.3 Ion-ion interactions and Debye-Huckel theory of ion cloud. 1.4 Concept of ionic strength and activity coefficient. 1.5 Debye-Huckel limiting law and its modifications. 1.6 Transport of ions in solution. Relaxation and Electrophoretic effects. 1.7 Debye-Huckel-Onsager equation, validity and limitations.	8 hours
	2. Electrified Interfaces 2.1 Formation of an electrified interface and its structure. 2.2 Polarizable and non-polarizable interfaces. 2.3 Concepts of outer potential, surface potential, inner potential and relationship between them, chemical and electrochemical potentials. 2.4 Concept of surface excess, Electro-capillary curves, Condition for thermodynamic equilibrium at electrified interface. 2.5 Generalized Gibbs equation, Lippmann equation and capacity of the double layer. 2.6 Models of the electrified interface. 2.7 Surface phase and Gibbs adsorption equation. Surface tension and adsorption on solid. Determination of surface excess.	8 hours
	3. Electrode Kinetics and Corrosion 3.1 Disturbance of electrode equilibrium, cause of electron transfer, fast and slow systems and their current-potential relationship. 3.2 Butler-Volmer equation and its low and high field approximations. 3.3 Nernst equation as a special case of B-V equation. 3.4 Tafel plots for anodic and cathodic processes. 3.5 Study of pH-potential diagrams.	8 hours

	<p>3.6 Pourbaix diagram for corrosion of iron.</p> <p>4. Colloids and Mircoemulsions.</p> <p>4.1 Charge and Stability of Sols. DLVO theory</p> <p>4.2 Electrokinetic phenomena: Electroosmosis, streaming potential and current, electrophoresis. Zeta potential.</p> <p>4.3 Donnan membrane equilibria.</p> <p>4.4 Micelles and reverse micelles: solubilisation, and bilayers.</p> <p>4.5 Microemulsions</p> <p>5. Electrochemical Energies</p> <p>5.1 Thermodynamics of electrochemical energy conversion.</p> <p>5.2 Batteries: basic principles; rating and shelf life. Zinc-manganese dioxide: Leclanche and alkaline batteries. Lithium ion batteries and recharge ability.</p> <p>5.3 Fuel cells: Principle of a hydrogen-oxygen fuel cell. Classification of fuel cell systems based on types of electrolytes/temperature. Direct methanol-polymer electrolyte fuel cell and electro-catalysts - a case study. Reactions occurring in various fuel cells and calculation of their electrode and cell potentials</p> <p>5.4 Super capacitors: Introduction: Origin of supercapacitance. Aqueous systems – ruthenium oxide/carbon with sulphuric acid and or solid polymer electrolytes.</p>	<p>6 hours</p> <p>6 hours</p>
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Group Theory and Spectroscopy

Course Code: PCC-504

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce concepts in Group Theory and its applications to chemistry. To introduce some advanced topics in spectroscopy.	
Course Outcomes:	Students should be in a position to understand various concepts of Group Theory. Should be able to apply character table to solve various problems. Students should be in a position to apply the knowledge of spectroscopy for their dissertation and research work.	
Content:	<p>4. Elements of Group Theory</p> <p>1.1 Symmetry elements and symmetry operations, Concept of group and group multiplication tables, order of the group, classes and subgroups in a group, Different types of groups (cyclic, abelian and non-abelian groups).</p> <p>1.2 Point groups, Matrix representations of a group, Reducible and Irreducible representations groups, Great Orthogonality Theorem, Properties of Irreducible representations, Mulliken symbols for Irreducible representations, Character tables.</p> <p>1.3 Standard reduction formula, Direct products of representations and its applications Quantum Chemistry and spectroscopy: Vanishing of integrals, Selection rules. Applications of group theory for hybridization of atomic orbitals. Projection operator and Symmetry adapted linear combinations (SALCs), MO treatment (within Huckel Molecular Orbital Theory) of large molecules with symmetry. Applications of group theory to Infra-red and Raman spectroscopy.</p> <p>2. Microwave, IR and Raman Spectroscopy</p> <p>2.1 Theoretical treatment of Rotational and Vibrational spectroscopy.</p> <p>2.2 Principle of Fourier Transform (FT) spectroscopy, FTIR spectroscopy Theory, instrumentation and applications.</p> <p>2.3 Quantum theory of Raman effect, Raman shift, Instrumentation, Resonance Raman spectroscopy, Complementary nature of IR and Raman spectroscopy in structure determination, Applications.</p> <p>3. NMR Spectroscopy</p> <p>3.1 Basic principles of NMR.</p> <p>3.2 Theory of pulse NMR and Fourier analysis, FT-NMR.</p> <p>3.3 Solid state NMR, magic angle spinning (MAS), dipolar decoupling and cross polarization, applications of solid state NMR.</p> <p>3.4 Double resonance, NOE, Spin tickling, Solvent and shift reagents, Structure determination by NMR.</p> <p>4. ESR Spectroscopy</p>	<p>18 hours</p> <p>6 hours</p> <p>8 hours</p> <p>4 hours</p>

	<p>4.1 Theory and experimental techniques, Identification of odd-electron species (methyl and ethyl free radicals) and radicals containing hetero atoms.</p> <p>4.2 Spin trapping and isotopic substitution, Spin densities and McConnell relationship, Double resonance techniques.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

	<ol style="list-style-type: none"> 1. To determine the partial molal volume of ethanol-water mixture at a given temperature 2. To study the phase rule for two component system 3. To determine the partial molal volume of sodium chloride-water, ethanol-water and methanol-water system (apparent molal volume method) 4. To determine the effect of salt on surface tension of water using by capillary rise method 5. To study effect of surfactants on surface tension of water using stalagmometer 6. To study the variation of viscosity with composition of mixtures and to verify the formation of compounds by Oswald's viscometer 7. To study the effect of pH on the kinetics of iodination of aniline 8. To study the kinetics of reaction between H_2O_2 and KI (clock reaction) 9. To study the kinetics of rapid reaction between bromine and iodine in aqueous media 10. To investigate the autocatalytic reaction between potassium permanganate and oxalic acid. 11. To study the electroless deposition of Ni on non-conductor substrate and to determine the rate of deposition 12. To study the acid and alkaline corrosion susceptibility of metal and to determine the rate of corrosion 13. To study the catalytic activity of three different metal oxides in heterogeneous systems with H_2O_2 decomposition reaction 14. To determine the molecular weight of a polymer by intrinsic viscosity method. <p>Group - C. Computers in Chemistry</p> <ol style="list-style-type: none"> 1. To generate a mark sheet to learn various features of spreadsheets (revision) 2. To generate a plot for a given function (like solutions of 1D box, harmonic oscillator, H-like atom wave functions, Gaussians distributions etc) (revisions) 3. To write a computer program to obtain equivalence point in pH-metry and potentiometric experiments (derivative method) 4. To write a computer program to find percent composition for various atoms of a given molecular formula 5. To write a computer program to obtain slope and intercept for linear data using least square fit method 6. To write a computer program to obtain center of mass of a given molecule and moment of inertia, hence obtain 	24 hr
--	--	-------

	<p>classification of the given molecule</p> <p>7. To write a computer program to find out various parameters for data analysis viz. minimum, maximum, average, standard deviation, variance, covariance, correlation coefficient, frequency distribution etc.</p> <p>8. To write a computer program to obtain thermodynamic probability.</p> <p>9. To write a computer program to obtain degeneracy of a given energy level for a particle in a cube.</p> <p>Note: A minimum of 4 experiments from each group A-C are to be carried out.</p>	
Pedagogy:	Practical / Hands on sessions will be conducted.

Programme: M. Sc. Part-II (Chemistry)

Course Code: PCO-503

Title of the Course: Solid State Chemistry II: Characterization of solid materials

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course Solid State Chemistry I : Concepts and Application, so as to have basic knowledge of solids state chemistry.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none">1. To introduce solid state characterization methods and techniques.2. To provide fundamental knowledge of principles and instrumentation involved in selected techniques.3. To provide comparative evaluation of data obtained from various techniques and its use in elucidating the chemical and morphological structure of solid materials	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand the design of the instrumental techniques, data acquisition and storage.2. Students should be able to understand the fundamental principles governing the technique, data interpretation and analysis to elucidate structural information of solid materials3. Students should be in a position to understand and apply the concept learned to make the best choice of a characterization technique(s) for elucidation of unknown solids under investigation.	
Content:	<p>1. Thermal Analysis</p> <p>1.1 Thermogravimetric analysis, Differential Thermal Analysis</p> <p>1.2 Differential scanning calorimetry</p> <p>1.3 Application to characterization of materials</p> <p>2. X – Ray Diffraction:</p> <p>2.1 The powder X-ray diffraction experiment, instrumentation</p> <p>2.2 Intensities: scattering of X-Rays and factors that affect intensities, powder x-ray pattern</p> <p>2.3 Introduction to single crystal x-ray diffraction.</p> <p>2.3 Applications of high temperature powder diffraction.</p> <p>2.4 Identification of crystal phases and evaluation of lattice characteristics</p> <p>3. Microscopic Techniques</p> <p>3.1 Introduction to Electron Microscopy: Generation of electron beam, elastic and inelastic scattering of electrons by atoms</p> <p>3.2 Scanning Electron Microscopy (SEM): Instrumentation, optics, resolution and compositional imaging, acquisition and data storage. Preparation of specimen, crystallographic information from SEM and environmental scanning electron microscopy</p>	<p>5 hours</p> <p>10 hours</p> <p>6 hours</p>

	<p>3.3 High Resolution Transmission Electron Microscopy (HR-TEM): Instrumentation, contrast mechanism, high voltage and scanning transmission microscopy, preparation of specimen and data interpretation.</p> <p>4. Selected Spectroscopic Techniques</p> <p>4.1 Vibrational spectroscopy: IR and Raman spectroscopy, fundamental principle, instrumentation and design, applications to ferroelectric materials such as LiNbO_3 and LiTaO_3.</p> <p>4.2 Visible and UV spectroscopy of solids: Fundamental principle, diffuse reflectance measurement, instrumentation and design, structural studies of transition metal oxides, glass and laser materials.</p> <p>4.3 X ray Spectroscopy: XRF, XANES and EXAFS: Absorption coefficient, absorption edges, resonance emission, extended absorption and photoelectron scattering. Instrumentation and design, characterization of transition metal oxides.</p> <p>4.4 Mössbauer Spectroscopy: Mössbauer effect, recoil free absorption and emission in solids, isomer shift, quadrupole splitting, magnetic splitting, instrumentation and design, characterization of Iron compounds.</p>	15 hours
Pedagogy:	Mainly lectures, tutorials, assignments and presentations or a combination of some of these could also be used to some extent.	
Text Books / Reference Books	<ol style="list-style-type: none"> 1. A. R. West, <i>Solid state chemistry and its applications</i>, John Wiley & Sons, 2005. 2. D. Brandon & W. Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course PCC- 401, PCO- 401 in Semester I/II, so as to have basic knowledge of reaction kinetics.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce concepts of reaction kinetics and dynamics 2. To provide fundamental knowledge of theories that govern chemical reactions 3. To introduce newer classes of reaction types and their kinetics 4. To introduce latest developments in the advance instrumental techniques and methods for monitoring reaction kinetics and dynamics. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand the concept of reaction kinetics and its significance. 2. Student will be able to differentiate between different reaction types, their kinetic analysis and its significance 3. Students should be able to apply these kinetic concepts to perform laboratory experiments in reaction kinetics. 3. Students should be in a position to apply these concepts of real life applications such as combustion engines, photochemical systems and atmospheric chemistry research. 	
Content:	<ol style="list-style-type: none"> 1.0 Theories of reaction rates <ol style="list-style-type: none"> 1.1 Generalized kinetic theory and extended collision theory. Concept of collisional number, collisional frequency factor, collisional and reactive cross section, steric factor, microscopic rate constant. Assumptions and limitations of collision theory 1.2 Conventional transition state theory, equilibrium hypothesis and derivation of reaction rates. Thermodynamic formulation of transition state theory. Arrhenius temperature dependent and independent activation energy and its significance. Assumptions and limitations of transition state theory. Introduction to extended transition state theory and microscopic reversibility. 1.3 Lindemann-Hinshelwood theory of thermal unimolecular reactions. Statistical energy dependent rate constant. Introduction to RRK and RRKM Theory and its applications. 2.0 Elementary reactions in solutions <ol style="list-style-type: none"> 2.1 Collisional kinetics in solution, effect of solvent polarity solvent cohesion energy, influence of ionic strength and ion-dipole and dipole-dipole reactions on reaction rates. Comparison of gas phase and solution reactions. 3.0 Homogeneous and surface reactions 	<p>8 hr</p> <p>3 hr</p> <p>8 hr</p>

	<p>3.1 Homogeneous kinetics, enzymatic reactions and Michaelis-Menten, Lineweaver-Burk and Eadie Analysis</p> <p>3.2 Autocatalytic and inhibition reactions. Product induced competitive and non-competitive inhibition reactions.</p> <p>3.3 Adsorptions: competitive, non-ideal and dissociative adsorptions</p> <p>3.4 Mechanism of surface reactions, kinetic effects of surface heterogeneity and interactions.</p> <p>3.5 Eley-Rideal, Langmuir Hinshelwood and Mars van Krevelen kinetic models of surface reactions</p> <p>4.0 Composite reactions</p> <p>4.1 Types of composite mechanisms, rate equation for composite mechanisms, simultaneous and consecutive reactions</p> <p>4.2 Decomposition reactions of ozone and acetaldehyde</p> <p>4.3 Gas phase combustion reactions, hydrogen – oxygen combustion, introduction to shock tube method and its use in combustion analysis.</p> <p>4.4 Polymerization kinetics, stepwise and chain polymerization.</p> <p>5.0 Fast Reactions</p> <p>5.1 Photochemical fast reactions: primary photochemical processes, reactions of electronically excited species and photochemical equivalence.</p> <p>5.2 Pulsed laser photolysis, multiphoton excitation processes and its use in monitoring fast reactions.</p> <p>5.3 Radiation-chemical reactions: radiation chemical primary processes, kinetic measurements in radiolysis method.</p> <p>5.4 Comparison of relaxation method and stopped flow technique.</p> <p>6.0 Reversible, Irreversible and Oscillatory reactions.</p> <p>6.1 Kinetics of reversible, irreversible reactions and graphical analysis</p> <p>6.2 Voltera-Lotka hypothesis of oscillatory reactions. The significance of bi-stability in the Briggs-Rauscher Reaction and Belousov-Zhabotinskii reaction.</p> <p>7 Reaction Dynamics</p> <p>7.1 Reactive collisions, chemiluminescence and laser induced fluorescence.</p> <p>7.2 Introduction to potential energy surfaces, internal coordinates and modes of vibration with suitable examples.</p> <p>7.3 Introduction to molecular reaction dynamics, investigation of reaction dynamics with ultrafast lasers.</p>	<p>4 hr</p> <p>5 hr</p> <p>4 hr</p> <p>4 hr</p>

Programme: M. Sc. Part-II (Chemistry)
Title of the Course: Colloids and Surface Science
Course Code: PCO-505
Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/ hours
Course Objectives:	To Introduce surface properties of materials and forces at different interfaces. To introduce the concept of micelles, microemulsions. To introduce different adsorption models.	
Course Outcomes:	Students should be in a position to understand surface phenomenon and properties of interfaces. Students should be in a position to understand electrochemical phenomenon at interfaces. Students should be in a position to apply these concepts during the lab course in physical chemistry	
Content:	<p>1. Liquid Surfaces and Interfaces</p> <p>1.1 General Introduction. Microscopic picture of liquid surface. 1.2 Surface tension and its measurement. Curved liquid surfaces. 1.3 The Kelvin equation and capillary condensation. 1.4 Nucleation Theory. 1.5 The surface excess. Gibbs energy and surface tension. The surface tension of pure liquids. Gibbs adsorption isotherm.</p> <p>2. Electrokinetic Phenomena and Surface Forces</p> <p>2.1 Electrocapillarity – theory and measurement. 2.2 Charged surfaces such as mercury, silver iodide and oxides. Measurement of surface charge densities. 2.3 Electrokinetic phenomena: concept of zeta potential. 2.4 Surface forces – Van der Waals forces between molecules. Surface energy and Hamaker constant. 2.5 Measurement of surface forces. The DLVO theory and beyond. 2.6 Contact angle and its measurements. The line tension. Wetting and wetting transitions.</p> <p>3. Solid Surfaces</p> <p>3.1 Surface stress and surface tension. Determination of surface energy. Surface steps and defects 3.2 Solid – solid interfaces 3.3 Microscopy of Solid surfaces: Optical microscopy, Electron Microscopies, Scanning Probe Microscopy (STM, AFM). 3.4 Diffraction Methods.</p> <p>4. Adsorption</p> <p>4.1 Types of adsorption and adsorption times. Classification of adsorption isotherms. 4.2 Thermodynamics of adsorption.</p>	<p>7 hr</p> <p>9 hr</p> <p>6 hr</p> <p>6 hr</p>

	<p>4.3 Adsorption Models. The potential theory of Polanyi. 4.4 Experimental aspects of adsorption from gas phase. 4.5 Adsorption on porous solids. 4.6 Adsorption from solution.</p> <p>5. Surfactants, Micelles, Emulsions and Thin films 5.1 Classification of surfactants. 5.2 Spherical micelles: cmc and influence of temperature. Thermodynamics of micellization. Structure of surfactant aggregates 5.3 Macroemulsions: properties, formation and stabilization. Evolution and aging. Coalescence and demulsification. 5.4 Microemulsions: size of droplets. Elastic properties of surfactant films. Factors influencing the structure of microemulsions.</p>	8 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<p>Text Book</p> <ol style="list-style-type: none"> 1. H J Butt, K. Graf and M. Kappl, Physics and Chemistry of Interfaces, Wiley-VCH, 2006. 2. A.W. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Nanoscience: Concepts and Applications

Course Code: PCO-506

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/hours
Course Objectives:	1. Introduction of various concepts for nanoscience. 2. Introduction of various synthesis methods of nanomaterials. 3. Introduction of various characterisation techniques and application study of nanomaterials	
Course Outcomes:	Students will learn different techniques of synthesis and characterisation of nanomaterials. Students should be in a position to understand magnetic, electrical, optical and catalytic properties of materials at nanoscale level. Students should be in a position to apply the knowledge of subject for their dissertation and research work.	
Content:	1. Essential concepts and definitions Nanoscale, interdisciplinary nature of nanoscience, quantum effects, colours from colloidal gold, Surface to volume ratio of nanoparticles, surface effects and surface energy on nanoparticle surface. 2. Electronic and Electrical properties Chemistry of solid surfaces, Zero dimensional systems: nanoparticles One dimensional systems: nanowires and nanorods Metallic nanowires and quantum conductance. 3. Fabrication of nanoscale materials: top-down vs bottom-up approach i. Physical nanofabrication methods for the two dimensional nanostructures such as Thin film deposition of metallic copper, aluminium, tungsten and semiconducting silicon and Gallium arsenide films; Epitaxial growth; chemical vapour deposition and molecular beam epitaxial methods for the synthesis of semiconducting thin films, ii. Plasma Lithographic, photolithography, e-beam lithographic techniques for the transfer of circuit and nanopatterns on thin films. Positive and negative photoresists, different etching methods for the final pattern transfer on thin films. iii. Synthesis of colloidal metallic nanoparticles using different stabilizing and complexing agents such as citric acid and use of surfactants. iv. Discussion of Self assembly growth modes for thin films and colloidal nanoparticles : Stransky-Krastinova and Ostwald ripening	5 hr 5 hr 8 hr

	<p>4. Investigation of important nanomaterials:</p> <p>Silica: discussion of sol-gel and liquid crystal synthesis method, self assembly of colloidal silica particles, photoluminescence property of opals, different surface functionalization methods and application study</p> <p>Gold: Different colloidal synthesis methods, self assembly methods, surface Plasmon resonance (SPR) of colloidal gold nanoparticles surface functionalization strategies and application study</p> <p>CdSe: Different synthesis methods, synthesis of coreshell particles, Study of CdSe excitons and CdSe quantum dots, functionalization and application study.</p> <p>Iron oxide, Different synthesis methods Superparamagnetism property of nanoparticles, Hysteresis and magnetisation of Fe₃O₄ nanomaterial, catalytic and Biomedical applications.</p> <p>Carbon: synthesis methods for carbon nanotubes, Graphene and Buckminster fullerene, structural study of these materials, electrical property study of these materials, surface functionalization strategies and application study</p>	10 hr
	<p>5. Characterisation of nanomaterials</p> <p>i. Beam probe methods: Instrumentation, physical principle and different modes of operations in electron microscopic techniques such as Transmission electron microscope Scanning electron microscope and <i>Energy-dispersive X-ray spectroscopy</i>.</p> <p>ii. Electron and Scanning probe methods: Instrumentation, physical principle and different modes of operations in scanning tunnelling microscopy (STM) and Atomic force microscopy.</p> <p>iii. Optical Microscopes: Instrumentation, physical principle and different modes of operations in <i>Stimulated emission depletion (STED) microscopy</i> STED, Single molecule microscopy and <i>Dynamic light scattering (DLS)</i> is a technique.</p>	4 hr
	<p>6. Applications of nanomaterials</p> <p>Polymer vesicles for drug delivery, interaction of nanoparticles with DNA, Biosensors, Heterogeneous catalysts for the synthesis of fine chemicals, use of nano TiO₂ and ZnO for water and air pollution control.</p>	4 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

			HCO-506	Pharmaceutical Stability	3
			HCO-507	Laboratory Course in Natural Product Analysis	3
			HCO-508	Laboratory Course in Drug Product Formulation and Development	4
			HCO-509	Laboratory Course in Drug Design, Molecular Docking and Patents	2
			HCO-510	Laboratory Course in Quality Control and Quality Assurance	4

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-501

Title of the Course: Pharmaceutical Chemistry II

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the course in Pharmaceutical Chemistry at T Y B Sc level.	
<u>Course Objective:</u>	To learn major classes of drugs and understand its SAR and Mechanism of action.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to identify the examples in different classes of drugs• Students should be able to write IUPAC names and Structure of drugs.• Students shall be in a position to understand the mechanism of action of selected classes of drugs.• The students will have a clear understanding of concepts on SAR analysis.• The students will be able to apply synthetic organic chemistry knowledge in devising a synthesis for a drug.	
<u>Content:</u>	<p>1. Cholinergic and Adrenergic Agents, General Anaesthetics and Hypotensive agents Drugs acting on cholinergic nervous system: Bethanechol, Methacholine\$, Neostigmine, Pyridostigmine, Parathion, Malathion, Atropine, Dicyclomine\$, Tropicamide\$, Papaverine, Drugs acting on adrenergic nervous system: Methyldopa (MA,\$), Guanethidine, Ephedrine, amphetamine, Tranylcypromine, Pragyline, Norepinephrine, Epinephrine, Pronetalol, Propanalol\$, Atenolol\$, Metoprolol. General Anaesthetics: Ether, Nitrous oxide, Halothane\$, Ultra short acting Barbiturates-Thiopental sodium \$. Hypotensive agents acting on vascular smooth muscles: Nitrites, Amyl nitrites, Glyceryl nitrite\$, Pentaerythritol tetranitrate, Isosorbide dinitrate.</p> <p>2. Drugs acting on the central nervous system: Hypnotics and sedatives: Chloral hydrate, Phenobarbital\$, Secobarbital, Thiopental\$, Nitrazepam, Drugs acting as anticonvulsants: Phenytoin\$, phenacemide, Clonazepam, Phensuximide, Phenobarbital, (Classification of Barbiturates), Primidone, Carbamazepine\$. Psychotherapeutic agents: Phenothiazines such as Chlorpromazine, Chlorodiazepoxide\$, Oxazepam, Diazepam, Imipramine, Nialamide, Tranylcypromine, Pargyline. CNS stimulants: Phenmetrazine, Nikethamide\$, Iproniazid, PicROTOXINES, Tetrazole, Amphetamine.</p> <p>3. Antihistaminics, antiemetic, antiulcer drugs, Drugs used parkinsonism and Alzhemeier's Diphenhydramine, Triprolidine, Cyclizine, Promethazine\$, Cimetidine, Omeprazole (MA),Ranitidine, Sumatriptan, Ondisiton.</p>	<p>10 hours</p> <p>10 hours</p> <p>05 hours</p>

	<p>Drugs used in Parkinsonism: Benztropine mesylate, Levodopa, Carbidopa, Amantadine hydrochloride. Drugs for Alzheimer's diseases: Serin, Velnacrine, Aniracetam.</p> <p>4. Cardiovascular drugs, antihypertensive agents, and antibiotics: Digitoxin, Quinidine, Procainamide, Verapamil. Antihypertensive agents which elicit their action through autonomous nervous system previously described under 1 and 2, clonidine, hydralazine, ACE inhibitors- Enalapril and related drugs vasodilators such as Nitroglycerine, Isosuprine, Nylidrin, Antibiotics: Penicillin and semisynthetic penicillins and Cephalosporins, Amoxicillin, Cloxacillin, Streptomycin, Chloromphenicol, Tetracycline and derivatives, Erythromycin.</p> <p>5. Analgesics, Antipyretics and Inflammatory agents: Analgesics, antipyretics and anti-inflammatory agents: Aspirin\$, Sodium salicylate, Acetaminophen\$, Phenacetin, Phenylbutazone, Oxyphenbutazone, Ibuprofen\$, Naproxen\$, Probenacid, Allopurinol, Profen, Diclofenac \$. Narcotic analgesic agents: Morphine, Codeine, Levarphanol, Meperidine, Methadone, Dextropropoxyphene. Non-narcotic analgesic agents: Dextropropoxyphene morphine antagonist n-allyl-nor morphine, Levallorphan.</p> <p>Note: \$- Synthesis to be studied.</p>	<p>05 hours</p> <p>06 hours</p>
Pedagogy:	Mainly Lectures & tutorials. Seminars/ assignments/ presentations/ self-study/group discussion or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-502

Title of the Course: Drug Product Formulation and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on drug formulations	
<u>Course Objective:</u>	To understand the concept of drug dosage forms types of formulations and pilot plant process. To study the drug formulation development with specific examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">Students should be able to formulate drugsStudents should be able to apply this knowledge for formulation experiments in laboratory.	
<u>Content:</u>	1. Introduction and Classification: Introduction to drugs, Dosage Forms & Drug Delivery system – Definitions of Common terms. Drug Regulation and control, pharmacopoeias-formularies, sources of drug, drug nomenclature, routes of administration of drugs products, need for a dosage form, classification of dosage forms & brief description, study of excipients.	08 hours
	2. Drug Product Development Preformulation studies, objectives, factors to be considered, study protocol. Brief discussion on various parameters to be investigated. formulation and development of the dosage form/drug delivery system-general consideration.	08 hours
	3. Pilot plant Scale up techniques, Benefits of pilot plant- Broad guidelines of process development. General Consideration. Industrial manufacturing method and flow charts of sulphamethoxazole, Rifampicin, Chloramphenicol maleate.	08 hours
	4. Pharmaceutical manufacturing operations Brief discussion on unit operations and types of equipments/ machines used. Unit operations like size reduction, mixing/blending, drying, compression etc.	06 hours
	5. Dosage forms-formulation components, manufacturing and QC Liquids-monophase & biophase including ENT preparation. Semisolid e.g. Ointment, creams, gels etc. Solid dosage forms, e.g. Tablets, capsules, granules & powders. Sterile dosage forms, e.g. Injectables and ophthalmic preparations.	06 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations will be acquired methods for learning.	
<u>References/Readings</u>	1. Allen Popovich & Ansel, <i>Ansel's Pharmaceutical Dosage forms and Drug Delivery System</i> , B.I. Publication Pvt . Ltd, 2005,

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-503

Title of the Course: Drug Design and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of the concept of drug design and the need for it.	
<u>Course Objective:</u>	To make the students well versed with theories of drug action. To make the students understand the Structure Activity Relationship studies with respect to various examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to explain the theories of drug action.• Students should be able to apply Quantitative Structure Activity Relationship knowledge in drug designing• Students should be able to analyze the effect of different functional groups on the biological activity of drugs• The students will have a clear understanding of concepts on SAR analysis.• The students should be able to illustrate an example of drug designing by molecular modeling.• The students will be able to understand the terms in patents.	
<u>Content:</u>	1. Introduction to Drug design, Lead compounds and Pro-Drug Concept. Development of new drugs: Introduction, procedure followed in drug design, the search for lead compounds, molecular modification of lead compounds, prodrugs and soft drugs, prodrug; introduction, prodrug formation of compounds containing various chemical groups, multiple prodrug formation, soft drugs; design of soft drugs.	08 hours
	2. SAR and QSAR Studies in drug discovery Structure-Activity Relationship (SAR): Factors effecting bioactivity, resonance, inductive effect, isoterism, bioisosterism, spatial considerations, biological properties of simple functional groups. 4-5 illustrative examples depicting structural activity relationship studies. Theories of drug activity, occupancy theory, rate theory, induced-fit theory. Quantitative structure-activity relationship (QSAR): history and development of QSAR, drug receptor interactions, the additivity of group contributions, physico-chemical parameters, lipophilicity parameters, electronic parameter, ionization constants, steric parameters, chelation parameters, redox potential, indicator-variables, quantitative models.	08 hours
	3. QSAR Approaches in drug designing and modern methods in discovery Hansch analysis- Advantages and drawbacks. Free-Wilson	08 hours

	<p>analysis, Advantages and drawbacks. Their application, relationship between Hansch and Free-Wilson analysis (the mixed approach), non-linear relationship, Introduction to other QSAR approaches- Free Topliss Method-Postulates and Illustration. Introduction to molecular modeling using computers and docking, uses of molecular modeling manual use, further computer programming.</p> <p>4. Designing of Enzyme Inhibitors Structure-based drug design: Process of structure based drug design, deactivation of certain drugs necessary for T cell functioning, determination of the active site with special reference to chymotrypsin, design of inhibitors. Design of Enzyme Inhibitors, 9-alkylpurines, 9-mercaptapurines and allopurines, active site directed irreversible enzyme inhibition, suicide enzyme inactivators.</p> <p>5. Development of New drugs High throughput screening. Drug Design softwares and its applications. Intellectual property rights, patents, industrial designs, geographical indications, trademarks, trade secrets. Patentable inventions. Patentable drugs. Role of patents in Pharmaceutical industry. trade related aspects (TRIPS), international & regional agreements. Examples of new drugs developed.</p>	<p>06 hours</p> <p>06 hours</p>
Pedagogy:	Lectures assignments presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-505

Title of the Course: Laboratory Course in Pharmaceutical Chemistry

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have undergone practical course in pharmaceutical chemistry at TYBSc. Level.	
<u>Course Objective:</u>	To apply the theoretical knowledge of pharmaceutical chemistry for synthesis.	
<u>Course Outcome</u>	A Student should be able to apply synthetic organic chemistry knowledge for synthesis of drug like compounds.	
<u>Content:</u>	1. Methods for synthesis of pharmaceutical compounds. a) Acetylation of p-aminophenol to acetanilide b) Esterification of salicylic acid c) Benzoylation of alanine/L-Cysteine d) Diazotisation of m-nitroaniline and coupling to give azo dye e) Schiff bases from 2-aminophenol and p-bromobenzaldehyde f) Sulphonylation of aniline/phenol	16 hours
	2. Synthesis of bioactive heterocycles a) 2-Methyl Benzimidazole from o-phenylene diamine b) 2,3-DiphenylQuinoxaline from Benzil c) Dilantin from Benzil and urea d) 7-Hydroxycoumarin from ethylacetoacetate e) Barbiturate from diethyl-n-butylmalonate f) Flavone from 2-hydroxyacetophenone g) Benzoxazole from 2-aminophenol h) Synthesis of Phenothiazine derivative	36 hours
	3. Synthesis of medicinal compounds a) Synthesis of Propranolol from α -Naphthol b) Synthesis of Sorbic acid from crotonaldehyde c) Synthesis of Dichloramine-T and Chloramine-T d) Synthesis of Eosin from Fluorescein e) Synthesis of Gramine from Indole	20 hours

<u>Pedagogy:</u>	Laboratory work well understood by pre-lab and post-lab assignments.	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. K.A. Connors, <i>Text book of Pharmaceutical analysis</i>, Wiley Interscience Publication 1990, 3rd Ed. 2. J. Bassett, J. Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-501

Title of the Course: Pharmacological and Toxicological Screening Techniques

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of Biological Chemistry	
<u>Course Objective:</u>	To learn screening methods of biological Assay. To learn terms involved in Toxicology. To learn methods of analysis for Toxicology.	
<u>Course Outcome</u>	A student will be able to apply the role of various screening methods in bioassay. A student will be able to create various in vivo and in vitro assay methods for various targets. A student will be able to evaluate various effects of toxicology.	
<u>Content:</u>	1. Principles of Biological Standardisation, Screening methods Statistical treatment of model problems in evaluation of drugs-methods of biological assay, principles of biological assays-methods used in bioassay of vitamins, hormones, vaccines, cardiac drugs and other pharmacopoeial preparations. Organisation of Screening for the pharmacological activity of new substances. Anti-inflammatory agents-carrageenan induced paw oedema, cotton pellet method. Anticonvulsants: Convulsions induced by chemicals, induced by electroshock, combined procedures. Sympatomimetic agents: Mydriasis, the uterus and ascending colon of the rat.	12 hours
	2. Introduction to Toxicology: Definition and types of toxicology, Basic principles of toxicology, Carcinogenicity, mutagenicity, teratogenicity, acute, sub acute and chronic toxicity. Detailed toxicity(mild/moderate/severe toxicity wherever applicable) and treatment of drugs such as salicylates/ paracetamol, opium, quinine, ethyl alcohol, etc. Toxic chemicals in the environment, impact of toxic chemicals on enzymes. Biochemical effects of arsenic, lead mercury, cadmium, carbon monoxide, pesticides and carcinogens.	12 hours
	3. Essentials of Analytical Toxicology Physicochemical, biochemical & genetic basis of toxicity; Principles of toxicokinetics, mutagenesis and carcinogenesis – Behavioural, inhalation toxicity, hypersensitivity and immune response, range finding tests – Acute, subacute and chronic toxicity studies. Classification of Toxins: Acute toxicity tests, Determination of LD ₅₀ value, Subacute tests - Histopathological and biochemical estimations on toxicity induced in animal models – Modern methods of analysis for Toxins-Barbiturate poisoning, Amphetamine poisoning.	12 hours

<u>Pedagogy:</u>	Lectures, assignments, presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-502

Title of the Course: Calibration and Validation

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied practical course involving calibration of analytical instruments	
<u>Course Objective:</u>	To learn principles of calibration and validation of analytical instruments. To learn validation procedures for analytical instruments. To learn qualification of various analytical instruments.	
<u>Course Outcome</u>	A student will be able to apply calibration techniques to analytical instruments. A student will be able to validate analytical instruments. A student will be able to evaluate qualifications of analytical instruments.	
<u>Content:</u>	1. Calibration and Validation of Analytical Instruments Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Regulatory requirements for analytical method validation. International conference on harmonization (ICH) guideline Q2A:	12 hours
	2. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	12 hours
	3. Qualification of analytical instruments Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and field visits will be the acquired methods for learning.	
<u>References/Readings</u>	1. WHO guidelines (2014-2018) 2. Michael E. Swartz, <i>Analytical Method Development & Validation</i> , CRC Press, 1997. 3. Loftus & Nash, <i>Pharmaceutical Process Validation</i> , Dekker Incorporated, Marcel, 1984.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-503

Title of the Course: Polymers in Pharmaceuticals and novel drug delivery systems

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the topic on polymers in the TYBSc. Level	
<u>Course Objective:</u>	To learn classification synthesis and properties of polymers. To learn the role of polymers in drug delivery systems. To learn new innovations in drug delivery systems.	
<u>Course Outcome</u>	A student will be able to identify the type of polymers that can be used for drug delivery systems. A student will be able to get the knowledge of innovative drug delivery systems and apply it for their lab project.	
<u>Content:</u>	1. Introduction and Types of Polymers in Pharmaceuticals Classification, General methods of synthesis, properties, characterization and evaluation: Biodegradable polymers - Classification - Mechanism of biodegradation in the body. Polymer processing with respect to novel formulation design: Applications of polymers in novel drug delivery systems. Introduction to Novel Drug delivery systems, drug delivery carriers, routes of administration.	12 hours
	2. Polymers as Novel Drug Delivery systems Recent advances in drug delivery systems. Theory of controlled release drug delivery systems. Microencapsulation – Methods of encapsulation. Transdermal drug delivery systems – Theory, formulation, production and evaluation. Targeted drug delivery systems – concept of drug targeting, importance in therapeutics.	12 hours
	3. Recent Innovations in drug delivery systems Recent innovations in conventional dosage form like tablets, capsules, sterile dosage forms, pellets, Mucoadhesive system, GRDDS, peptide drug delivery, supercritical fluid technique, PEGylation, Nanoparticulate drug delivery. Future opportunities and challenges.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and mini-projects will be the acquired methods for learning.

----------------------------	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-504

Title of the Course: Biopharmaceutics

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the concepts of drug metabolism at T Y B Sc level.	
<u>Course Objective:</u>	To learn ADMET. Drug absorption drug distribution Drug Action Drug metabolism and excretion To learn how bioavailability is important understanding the efficacy of a drug product.	
<u>Course Outcome</u>	A student will be able to relate drug absorption to bioavailability. A student will be able to get an in-depth knowledge of drug metabolism concept.	
<u>Content:</u>	1. Drug absorption, Dissolution and Distribution Based on cell membrane Gastro-intestinal absorption of drugs, mechanisms of drug absorption, factors affecting drug absorption: Biological, physiological, physico-chemical and pharmaceutical. Noyes-Whitney's dissolution rate law, study of various approaches to improve dissolution of poorly soluble drugs, In-vitro dissolution testing models, In-vitro-in-Vivo correlation. Factors affecting drug distribution, volume of distribution, protein binding – factors affecting, significance and kinetics of protein binding.	12 hours
	2. Drug Metabolism and Excretion Metabolism of drugs, Xenobiotics, Drug metabolizing organs and enzymes (microsomal & nonmicrosomal), Chemical pathways - Phase I reactions (Oxidative, reductive and hydrolytic reactions) and Phase II reactions (Conjugation), Significance of cytochrome P ₄₅₀ oxidation – reduction cycle, Factors affecting biotransformation of drugs. Renal excretion – Glomerular filtration, Active tubular secretion, Active (or) passive tubular reabsorption. Factors affecting renal excretions of drugs. Non renal excretions – Biliary, pulmonary, salivary, mammary, skin/dermal, gastrointestinal and genital excretions of drugs (Any two types)	12 hours
	3. Bioavailability and Bioequivalency studies Objectives and considerations in bioavailability studies, Concept of equivalents, Measurements of bioavailability, Determination of the rate of absorption, Bioequivalence studies and its importance,. Biopharmaceutical classification of drugs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

--	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-505

Title of the Course: Pharmaceutical Technology

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on pharmaceutical technology.	
<u>Course Objective:</u>	To learn unit processes involving various chemical reactions. To learn industrial synthesis of selected list of drugs. To learn the need for pilot plant in industry and also the flowchart on various manufacturing methods of drugs.	
<u>Course Outcome</u>	A student will be able to explain unit processes for various chemical reactions. A student will be able to apply industrial synthesis knowledge for the synthesis of drug like molecules in laboratory. A student will be able to apply the knowledge of effluent treatment methods.	
<u>Content:</u>	1. Unit Processes Concept of unit processes in systematization of chemical reactions, explanation of one example each for unit processes: Alkylation, amination, (by ammonolysis, reduction), carbonylation, carboxylation, condensation, dehydration, diazotization, disproportionation, esterification, halogenation, hydration, hydroformylation, hydrogenation, hydrolysis, hydroxylation, nitration, oxidation and reduction. 2. Industrial Synthesis Introduction to pharmaceutical manufacturing – raw materials, detailed manufacturing procedure, therapeutic function, common name, chemical name, structural formulae of the following drugs :Acyclovir, alprazolam, propranolol, naproxen, ibuprofen, aspirin, levodopa and cimetidine. Lidocaine, ethambutal hydrochloride, 5-fluorouracil, amoxycillin sodium. 3. Process Development & Process Optimization a) Pilot- plant – Introduction – Appraisal for the need of pilot – plant – pilot plant (Vs) Small scale plant – Benefits of Pilot plant – Broad guidelines of process development. b) Industrial manufacturing method and flow charts of Sulphamethoxazole, Ciprofloxacin, and Rifampicin. Environment Health & Safety: Introduction to industrial effluents. Classification of effluents. Classification of basic methods of purifying effluents.	12 hours 12 hours 12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-506

Title of the Course: Pharmaceutical Stability

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied some knowledge on stability of drugs	
<u>Course Objective:</u>	To learn to predict shelf life and half life of pharmaceutical formulations. To learn various stability protocols and also stability terminologies as given in ICH guidelines I To learn ICH guideline II that is thorough investigation into stability labs.	
<u>Course Outcome</u>	A student will be able to explain fundamentals of stability studies. A student will be able to determine stability requirements for OTC drug products. A student will be able to make a stability labs ready for FDA inspection.	
<u>Content:</u>	1. Fundamentals of Stability Basic concept and objectives of stability study. Fundamentals of stability testing requirements. Order of reaction and their applications in predicting shelf life and half-life of Pharmaceutical formulations.	12 hours
	2. ICH Guidelines-I Review ICH process and ICH updates on stability Common terminology and acronyms. Review current Q1A, Q1B, Q1D, Q1F, Q2, Q3 and Q6 guidelines Determine stability requirements for OTC products Stability SOPs Stability protocols and data Design of a compliant bracketing and matrixing.	12 hours
	3. ICH Guidelines-II ICH guidelines on bracketing and matrixing Stability testing laboratory Design and validation stability test procedures Stability data management system Investigation procedures of OOS stability results FDA inspection of stability labs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group project will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-507

Title of the Course: Laboratory Course in Natural Product Analysis

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the theory topics in natural products at TYBSc. Level.	
<u>Course Objective:</u>	To introduce the practical component in natural product analysis. To learn various methods involved in the analysis of natural products.	
<u>Course Outcome</u>	A student will be able to Isolate natural products. A student will be able to synthesize natural products. A student will be able to characterize natural products by physical methods of analysis.	
<u>Content:</u>	<ol style="list-style-type: none">1) Isolation of Caffeine from tea, coffee etc. and purification by microscale sublimation. Characterization of pure caffeine by IR.2) Isolation of Cinnamaldehyde from Cinnamon by microscale steam distillation. Characterization and interpretation of isolated Cinnamaldehyde by IR.3) Enzymatic reduction of ethylacetoacetate using Baker's yeast.4) Thin layer Chromatography for separation of mixtures of natural products/Market Formulations.5) Column chromatography of two component mixture of natural products/Market Formulations.6) Conversion of camphene to isobornyl acetate7) Hydrolysis of isobornyl acetate to isoborneol8) Oxidation of isoborneol to Camphor.9) Transformation of Benzaldehyde to Benzoin using thiamine B12 as a coenzyme.10) Isolation of cholesterol from gallstones11) Determination of Acid Value of Fixed Oil.12) Determination of Saponification Value of Fixed Oil.13) Determination of Eugenol in Clove Oil.14) Qualitative analysis of natural products (Comprises of amino acids, carbohydrates, proteins, alkaloids, glycosides, steriods, flavonoids)15) Isolation of piperine from black pepper powder. Characterization and interpretation of isolated Cinnamaldehyde by IR.16) Isolation of calcium citrate from lemon juice.	48 hours
<u>Pedagogy:</u>	Laboratory work.. pre-lab and post-lab exercises mini-projects will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-509

Title of the Course: Laboratory Course in Drug Design, Molecular Docking and Patents

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of structure drawing at T Y B Sc level.	
<u>Course Objective:</u>	To learn drug designing through drug discovery experiments (drug simulations) To learn to use molecular docking software packages. To learn about patenting in pharmaceuticals.	
<u>Course Outcome</u>	A student will be able to synthesize drug molecules carry out in vitro bioassay and drug simulation studies. A student will be able use various molecular docking softwares for designing certain drug targets. A student will be able to know the procedure to pharmaceutical patent can be filed.	
<u>Content:</u>	1) Drug Design and Discovery experiments 1. Synthesis of Aspirin and Oil of Winter green and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 2. Synthesis of Sulphacetamide and Sulphamethoxazole and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 3. Synthesis of acetanilide and paracetamol and its physical properties, <i>in vitro</i> biological assays and drug simulation studies.	16 hours
	2) Molecular Docking Experiments Use of software packages in chemistry for the following: To write a computer program to obtain a slope and intercept for linear data using least square fit. 1. Use of ChemDraw, ISISDraw for drawing structures, chemical reactions, equations. 2. Molecular docking softwares such as Hex software or autodocking. 3. Energy minimization of molecules and finding intermolecular interactions of small molecule with macromolecule such as inhibitor, thymidilate synthase, glycogen synthase, E.Coli protease. 4. Viewing Tools and Graphics Tools • Rasmol (http://www.umass.edu/microbio/rasmol/) • VMD (http://www.ks.uiuc.edu/Research/vmd/) • Molscrip (http://www.avatar.se/molscrip/) 6. The use of molecular dynamics techniques for drug discovery using NAMD (http://www.ks.uiuc.edu/Research/namd/). Tutorials are at http://www.ks.uiuc.edu/Training/Tutorials/ . 7. Docking of small molecules to protein targets using Autodock	24 hours

	<p>(http://autodock.scripps.edu/). Tutorials are at http://autodock.scripps.edu/faqshelp/tutorial/using-autodock-4-with-autodocktools.</p> <p>3) Patents</p> <ul style="list-style-type: none"> i) Prior Art Search on Target Drug (Any 2) ii) Patent Filing procedures (Any two case studies) 	8 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-510

Title of the Course: Laboratory Course in Quality Control and Quality Assurance

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the analysis of pharmaceuticals at TYBSc. Level.	
<u>Course Objective:</u>	To learn quality control analysis of drugs using analytical instruments. To learn to perform quality assurance experiments	
<u>Course Outcome</u>	A student will be able to use UV spectrophotometer dissolution apparatus high performance liquid chromatograph (HPLC) and Infra Red spectrophotometer. For quality control analysis of drugs. A student will be able to perform quality assurance experiments.	
<u>Content:</u>	<p>I) Quality Control Analysis Experiments</p> <p>Spectrophotometric Analysis</p> <ol style="list-style-type: none">1) Determination of % purity of a given sample of Chloramphenicol capsules IP.2) Determination of % purity of a given sample of Furosemide injection IP.3) Determination of % purity of a given sample of Allopurinol tablets IP.4) Determination of % purity of a given sample of Propranolol HCl tablets IP. <p>Dissolution Analysis (Any 2)</p> <ol style="list-style-type: none">1) Dissolution rate study of sustained release Theophylline tablets IP.2) Dissolution rate study of sustained release Diclofenac tablets IP.3) Analysis of Diclofenac sodium and paracetamol in combined dosage form. <p>Chromatographic Techniques in Pharmaceuticals:</p> <ol style="list-style-type: none">1) To identify the given drug amongst the paracetamol, aspirin and caffeine citrate with the help of thin layer chromatography and calculate its <i>R_f</i> value.2) To identify the given sulpha drug among the sulphadiazine, sulphamethoxazole and trimethoprim with the help of thin layer chromatography and calculate its <i>R_f</i> value.3) To perform the Separation of amino acids by paper chromatography.4) To identify the given sample of sugar with the help of ascending paper chromatography and calculate its <i>R_f</i> value.5) To demonstrate high Performance liquid chromatography and analyse Diazepam Tablets by High Pressure Liquid Chromatography.	<p>16 hours</p> <p>12 hours</p> <p>24 hours</p>

	6) To develop and validate the analytical method of any one drug using high performance liquid chromatography. 7) To analyze the given tablets of paracetamol/ibuprofen-paracetamol combination HPTLC method. 8) Separation of mixture of o-nitroaniline and p-nitroaniline using column chromatography. Infrared Spectroscopic analysis Demonstration of Instrumentation and Interpretation of Representative Spectra a) To differentiate between analgesic-NSAIDs :Aspirin, Ibuprofen, Paracetamol. b) To differentiate between Acetophenone, p-Nitroacetophenone, Benzamide. c) To interpret the I.R. spectra of the following compounds: Benzyl alcohol, Benzaldehyde, Acetanilide, Ethylacetate, Ethyl methyl ketone, m-nitroaniline.	8 hours
	II) Quality Assurance Experiments (Any 9) 1) Evaluation of Riboflavin/Ibuprofen tablets I .P. to characterize and evaluate the effect of different concentrations of binders and disintegrant. 2) Design and fabrication of theophylline sustained release formulation and comparison of its release profile with the conventional dosage form. 3) Formulation and evaluation of micronized disperse system for parenteral delivery of drugs including test for pyrogens and sterility testing etc. 4) Preparation of solid dispersions of poorly water soluble drugs using different carriers and to study the release profile and compare with conventional dosage forms. 5) Disintegration and dissolution of per oral tablets. 6) Influence of vehicle on drug availability from topical dosage forms in-vitro. 7) Design and preparation of a suspension and its evaluation. 8) Development of moisture resistant coating formulation for Amoxicillin tablets/ Ranitidine tablets. 9) Quality control of paper, Plastic and glass container. 10)Quality control of labels and label adhesives. 11)Microbial limit test in oral products. 12)Validation of sterilization equipments e.g. Hot air oven, Autoclave. 13)Validation of Analytical procedure.	36 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations and case studies will be given to students.

Programme: M. Sc. Part-II (Chemistry)

Course Code: CGO-501

Title of the Course: Selected Experiments in Chemistry

Number of Credits: 8

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the theory and practical courses in Analytical, Inorganic, Organic and Physical Chemistry at MSc-I level so as to have basic knowledge of experiments in chemistry.	
Course Objectives:	<p><i>This course is in lieu of Dissertation (8 credits) and is to be opted by those students who are not opting the dissertation at part-II level. Consequently, the course will be taught over two semesters (III and IV, 4 credits in each semester). The objectives and outcomes are thus defined considering the requirements of experimental Analytical, Inorganic, Organic and Physical Chemistry.</i></p> <ol style="list-style-type: none">1. Introduction of various instrumental techniques for analysis.2. Learning data analysis, handling and interpretation of spectra.3. To learn techniques of crystallization of ligands and synthesis of coordination compounds.4. To learn characterization of compounds using different instruments.5. To introduce analysis of ores for metal content.6. To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.7. To train the students in application of theoretical concepts related to organic spectroscopy by interpreting various spectra (UV, IR, NMR, Mass, 2D NMR etc.) of organic compounds.8. To impart experimental knowledge regarding computational and theoretical concepts in physical chemistry.9. To introduce synthesis methods of nanomaterials and nanoporous materials.10. To introduce computational techniques in physical chemistry.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to use different instruments for qualitative and quantitative analysis.2. To gain experience with some statistics to analyse data in lab.3. Students will be able to understand the methods of syntheses and characterization of coordination compounds4. Students will be in a position to synthesis, characterize and measure the solid state properties of oxide materials.5. Students shall gain the understanding of:<ol style="list-style-type: none">i. Stoichiometric requirements during organic syntheses.ii. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.iii. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of	

	<p>microwave, photochemistry, low temperature synthesis etc.</p> <p>iv. Use of organic spectroscopic techniques in monitoring the organic syntheses.</p> <p>6. Students should be in a position to understand mathematical and theoretical methods in chemistry.</p> <p>7. Students will be able to understand different methods for syntheses and characterization of nanomaterials and nanoporous materials.</p> <p>8. Students will understand the concepts of phase rule and adsorption.</p>	
Content:	<p>Unit-I: Analytical Chemistry- Instrumental methods of analysis. (Minimum 08 experiments to be performed.)</p> <ol style="list-style-type: none"> Potentiometric determination of dissociation constant of Cu-ammonia complex. Potentiometric titration of Zn^{2+} against $[Fe(CN)_6]^{4-}$ and determination of the empirical formula of the complex formed. To record and interpret the cyclic voltammogram for potassium ferricyanide $[K_3Fe(CN)_6]$ Kinetic investigation for Fe^{2+}/Fe^{3+} system using cyclic voltammetry To study the fluorescence spectroscopy by recording spectra for following compounds (Quinine sulphate and Anthracene) and compare the data of two compounds Quantitative determination of amount of anthracene/quinine sulphate using fluorescence spectroscopy Fractionation (based on polarity) of given mixture by Solvent extraction protocol followed by recovery of separated analyte using rotary evaporator and determination of purity by TLC analysis Separation of a mixture of o- and p- nitro anilines on an alumina column chromatography and recovery, reuse of mobile phase using rotary evaporator. Calibration of IR spectrophotometer using polystyrene film and to check the performance of the instrument. Estimation of aspirin and caffeine from APC tablet by UV-Visible spectrophotometry. <p>Unit-II: Inorganic Chemistry</p> <p>Group-1: Preparation of ligands (including distillation/ recrystallization) / metal-ligand compounds / inorganic compounds / crystal structure analysis: (Any 4 experiments)</p> <ol style="list-style-type: none"> Preparation of Schiff base and characterization. Preparation of substituted benzoic acids and characterization. Preparation of acetylacetonate complexes of Co(II) and Co(III) and estimation of cobalt. Preparation of a polyoxometallate and characterization Preparation of aluminium(III)tris(acetylacetonate) and estimation of aluminium. Preparation of potassium dihydroxodioxalatotitanate(IV) and estimation of titanium. 	<p>48 hours</p> <p>24 Hours</p>

	<ul style="list-style-type: none"> ii. Benzidine from hydrazobenzene (benzidine rearrangement). iii. Methyl orange/red from sulphanilic acid/anthranilic acid (diazotization). iv. Benzil to hydrobenzoin (NaBH_4 reduction). v. Photochemical transformation of benzophenone to Benzpinacol. vi. 2-(4-Methyl benzoyl) benzoic acid from phthalic anhydride and toluene (F-C reaction). vii. 2-(4-Methyl benzoyl) benzoic acid to methyl anthraquinone (PPA cyclisation). viii. Resolution of racemic phenyl ethylamine using tartaric acid. ix. Trans-Stilbene by Wittig reaction. x. Enamine alkylation :2- methyl cyclohexanone pyrrolidine enamine with CH_3I. <p>Unit IV: Physical Chemistry</p> <p>I. Computational Chemistry (Any Three Experiments.)</p> <ul style="list-style-type: none"> 1. Plotting various types of graphs viz. straight lines, exponential, Gaussians, orbitals, first and second derivative plots. 2. Working with molecular coordinates: Distance matrix, center of mass, bond angles, dihedral angles, bond lengths, moment of inertia. 3. Electronic Structure of Diborane using the nwchem default density functional and basis sets. 4. Vibrational Spectroscopy of Transition Metal Nitrosyls complexes using ab initio calculations. <p>II. Experimental physical chemistry (Any Five Experiments)</p> <ul style="list-style-type: none"> 1. Preparation of a transition metal oxide (ZnO / NiO) by three different precursors and their characterization by IR and XRD. 2. Synthesis of a photo catalyst (TiO_2 / ZnO) by two different precursors and study kinetics of adsorption and photocatalytic degradation of a suitable azo dye as pollutant. 3. Adsorption studies on the porous adsorbents and fitting the adsorption data using Freundlich and Langmuir adsorption isotherms. 4. To study the thermodynamics of the adsorption process and to determine thermodynamic parameters such as ΔS and ΔG of the adsorption process. 5. Synthesis of spherical and rod shaped colloidal silver nanoparticles and to perform stability and surface plasmon resonance (SPR) analysis using UV-vis spectrophotometer. 6. To study the three component system such as chloroform, acetic acid and water and to obtain tie lines and plait point. Plotting the composition of mixture on a ternary phase diagram. 	<p>18 hrs</p> <p>30 hrs</p>
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Note: The course would be taught over entire academic year with practicals from any two specializations in odd semester (III) and remaining two in the even (IV) semester. The ISA and SEA would be conducted in each of the semesters and final marks will be computed only at the end of even semester. Thus, students opting the course will be divided in to four batches and two of them together will undertake practicals in two specializations in one semester and remaining two in the next semester.

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the spectroscopic techniques such as UV-Vis, IR at FY B Sc, S Y B Sc or T Y B Sc levels so as to have basic knowledge of spectroscopy and basic principles.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction of various concepts in molecular and atomic spectroscopy. 2. Learning data analysis, handling and interpretation of spectra 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to use spectroscopic methods for qualitative and quantitative analysis. 2. Evaluate the utility of UV/Vis spectroscopy as a qualitative and quantitative method. 3. Identification of functional group based on IR spectra 4. Students should be in a position to predict the structure based on IR, NMR, MS data. 	
Content:	<p>1.Introduction to spectrochemical methods</p> <p>1.1. Interaction of Electromagnetic Radiation with Matter: electromagnetic spectra, Regions of Spectrum; Numericals.</p> <p>1.2 Electronic spectra and Molecular structure: kinds of transition, Chromophores and auxochrome; absorption by isolated chromophores, conjugated chromophores, aromatic compounds, inorganic chelates.</p> <p>1.3. Infrared absorption and molecular structures: IR spectra, overtones and bands-basis of NIR absorption</p> <p>1.4. Spectral Databases: Identification of unknown; Application of UV-Vis and IR spectroscopy for identification of unknown compounds</p> <p>1.5. Solvents for spectrometry: Choices and effect of solvents on UV-Vis and IR spectra.</p> <p>1.6. Quantitative Calculations: The Lambert-Beer's Law; Mixtures of absorbing species-laws of additivity of absorbance; calibration curve for calculation of unknown; Spectrometric errors in measurement; Deviation from Lambert-Beer's law-chemical deviation, instrumental deviation; Quantitative measurement from IR spectra; Numericals for quantitative analysis using UV-VIS spectroscopy.</p> <p>1.7. Spectrometric Instrumentation of UV-Vis and IR (brief introduction only): Sources, monochromators, sample cells, Types of instruments; detectors; Instrumental wavelength and absorption calibration. (Chapter 16: Analytical Chemistry, G.D. Christian, 6thEd.)</p> <p>2. Molecular Luminescence: Fluorimetry, Phosphorimetry and Raman Spectroscopy</p> <p>2.1. Introduction,</p> <p>2.2. Fluorimetry : Theory and basic principle; Quenching; Spectrofluorimeters and applications</p> <p>2.3. Phosphorimetry: Theory and basic principle; phosphorimeters and application</p> <p>2.4. Raman Spectroscopy: Theory and Structural analysis using Raman Spectra (Chapter 6: Instrumental Methods of Chemical Analysis, G.W. Ewing, 5thEd)</p> <p>3. Atomic Spectroscopy</p> <p>3.1. Principles of emission</p> <p>3.2. Atomic Emission spectroscopy (AES)</p> <p>3.3. Flame Emission spectroscopy (FES)</p>	<p>12 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>3.4. Atomic absorption Spectroscopy (AAS) 3.5. X-Ray Fluorescence Spectroscopy (XRF) (Introduction, principles and applications of above techniques shall be discussed; Chapter 13: Analytical Chemistry Principles, J.H. Kennedy, 2nded)</p> <p>4.Spectrometric Identification of Organic compounds 4.1 Ultraviolet and visible Spectroscopy : Brief Revision of UV/VIS Spectroscopy ;Instrumentation and Sampling ; Applications of Electronic Spectroscopy:Conjugated Dienes, Trienes, polyenes, α, βunsaturated carbonyl compounds, aromatic hydrocarbons (Assignment based on BSc. Syllabus for calculating λ_{max}) (Kemp – Chap4) 4.2 Infrared Spectroscopy: Introduction to IR spectroscopy; Basic IR spectra interpretation; Frequencies of functional group. (Kemp – Chap2). 4.3 Proton and Carbon NMR Spectroscopy: Theory of NMR ; Chemical shift; factors influencing chemical shift ; Solvents used in NMR; Theory of spin-spin splitting and simple spin systems;Coupling constant calculation; Factors influencing coupling constant (Assignment based on BSc. Syllabus) (Kemp - Chapter 3) 4.4 Mass Spectrometry : Basic PrinciplesandInstrumentation: Problem solving in structure elucidation based on MS (Kemp - Chapter 5) 4.5. Conjoint Spectrometry Problems: Structural elucidation of organic molecules using UV, IR, NMR (¹H, ¹³C), MS, (Silverstein)</p> <p>(Note:Assignment based on BSc. syllabus for all above spectrometric structure should be given to student. <i>More weightage of lectures shall be given for solving IR and NMR data for structur elucidation</i>)</p>	14 hr
Pedagogy:	Mainly lectures and tutorials. Seminars / term papers /assignments / presentations / self-study or a combination of some of these can also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACC-402

Title of the Course: Laboratory Course in Analytical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied practical chemistry courses at F.Y B.Sc, S.Y. B .Sc & T Y B Sc levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	Introduction of various experimental techniques for analysis. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	Students should be in a position to use standardized material to determine an unknown concentration. To gain experience with some statistics to analyse data in laboratory Students should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p><i>This course consists of 6 units of experiments in various areas of Analytical chemistry. Minimum 12 experiments shall be carried out and at least 02 experiment from each unit shall be conducted.</i></p> <p>UNIT 1: STATISTICS 1.Calibration of apparatus (balance, volumetric flasks, pipettes and burettes) and preparation of standard solutions and standardisation</p> <p>UNIT 2: COLORIMETRY AND UV-VISIBLE SPECTROPHOTOMETRY 2.Estimation of Iron from Pharmaceutical sample (capsule) by thiocyanate method 3. Estimation of lead/nitrate in water sample 4. Estimation of KNO_3 by UV spectroscopy and $\text{K}_2\text{Cr}_2\text{O}_7$ by Visible spectroscopy 5. Simultaneous determination and Verification of law of additivity of absorbances ($\text{K}_2\text{Cr}_2\text{O}_7$ and KMnO_4) 6.Estimation of phosphoric acid in cola drinks by molybdenum blue method</p> <p>UNIT 3: FLAME SPECTROPHOTOMETRY 7.Estimation of Na 8.Estimation of K or Ca</p> <p>UNIT 4: VOLUMETRY 9.Estimation of Ca in pharmaceutical tablet. 10.Estimation of Al and/or Mg in antacid tablet</p> <p>UNIT 5: ION EXCHANGE CHROMATOGRAPHY & SOLVENT EXTRACT ION 11.Separation and Estimation of Zn and Cd 12.Separation and Estimation of chloride and bromide 13.Extraction of Cu as copper dithiocarbamate (DTC) using solvent extraction and estimation by spectrophotometry</p>	

	UNIT 6: INTERPRETATION EXERCISES 14. Thermal studies: TGDTA and Isothermal weight loss studies of various hydrated solids like $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$, $\text{Ca}_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$, $\text{Fe}_2\text{C}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ 15. X-ray powder diffractometry: Calculation of lattice parameters from X-ray powder pattern of cubic system such as NiMn_2O_4 , CoFe_2O_4 etc.	
Pedagogy:	Prelab exercises / assignments / presentations / lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ACO-401

Title of the Course: Analytical Techniques

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different analytical techniques used for qualitative, quantitative estimation	
Course Outcomes:	3. Students should be in a position to understand principle behind different analytical techniques 4. With the knowledge basic techniques used for qualitative and quantitative estimation students should be in a position to choose for appropriate technique for particular analysis 5. Students should be in a position to select the separation techniques for purification of analytes.	
Content:	<p style="text-align: center;">Section A</p> <p>1 Analytical Objectives, Data Handling and Good Laboratory Practice (GLP) Scope of analytical science and its literature, qualitative and quantitative analysis, ways to express accuracy and precision, types of errors and their causes; significant figures, control charts, confidence limit, test of significance, rejection of a result- the Q-test. Introduction to significant analytical procedure such as GLP- standard operating procedures, quality assurance, quality control and analytical method validation.</p> <p>2 Sampling and Calibration Methods Sampling and sample preparation, general steps in chemical analysis, calibration of glass wares. Finding the best straight line-least square regression, correlation coefficient; Calibration curves, standard addition technique and internal standards. Chemical concentrations.</p> <p>3 Electroanalytical techniques Introduction to electroanalytical techniques, electrochemical cells, electrode potentials, voltammetry and polarography, cyclic voltammetry, coulometry, controlled potential coulometry and coulometric titrations, Stripping voltammetry, ion-selective electrodes and sensors; Evaluation and Calculation; Application to Inorganic and Organic Trace analysis</p> <p style="text-align: center;">Section B</p> <p>1. Extraction Techniques Liquid-liquid extraction/solvent extraction: partition coefficient, distribution ratio and percent extraction; choice of solvents; Solvent extraction of metal ions-ion association complexes and metal chelates; multiple batch extraction, Craig's counter-current distribution; Introduction to green analytical extraction methods: Supercritical Fluid Extraction (SFE); Pressurized Liquid Extraction (PLE); Ultrasound Assisted Extraction (UAE); Microwave Assisted Extraction (MAE);</p>	<p>7 hr</p> <p>5 hr</p> <p>6 hr</p> <p>4 hr</p>

	<p>Enzyme Assisted Extraction (EAE); Solid Phase Microextraction (SPME); Solid Phase Extraction (SPE)</p> <p>2. Basic Principles in Chromatographic Methods Principles of chromatography, classification of chromatographic techniques based on mechanism of retention, configuration, mobile and stationary phase. Efficiency of separation- plate theory (theoretical plate concept) and rate theory (Van Deemter equation). Principles and applications of Paper chromatography, thin layer chromatography, HPTLC, Size exclusion and Ion exchange chromatography. Counter-current chromatography for isolation of natural products.</p> <p>3. Gas and Liquid Chromatography Introduction; Instrumental Modules; The Separation System; Choice of Conditions of Analysis; Sample Inlet Systems; Detectors; Practical Considerations in Qualitative and Quantitative Analysis; Coupled Systems-introduction to GCMS, LCMS; Applicability-interpretation and numerical problems; Recent and Future Developments</p> <p>4. Radioanalytical techniques Theory and principles of radio analytical technique, detection of nuclear radiation, radiation detectors, pulse height analysis, counting error, analytical application of radioisotopes, neutron activation analysis and isotope dilution analysis.</p>	<p>4 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / presentations/ self-study or a combination of some of these can also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Title of the Course: General Inorganic Chemistry

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in Chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.BSc. levels so as to have basic knowledge of Inorganic Chemistry and basic principles.	No. of lectures
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce atomic / molecular structure and symmetry. 2. To provide fundamental knowledge of solid state chemistry. 3. To introduce basic aspects of coordination / organometallic / bioinorganic chemistry. 4. To provide the concepts of acids and bases. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand atomic and molecular structure and the importance of symmetry. 2. Students should be able to understand molecular shapes. 3. Students should be in a position to understand concepts in i) solid state chemistry, ii) coordination chemistry, iii) organometallic chemistry, iv) bioinorganic chemistry. 	
Content:	<p>1. Atomic structure, molecular structure and bonding</p> <p>1.1 Atomic Structure: Structures of hydrogenic atoms: some principles of quantum mechanics. Many electron atoms: penetration & shielding, building up principle, classification of elements. spectroscopic terms. Atomic/ionic radii, ionization energy, electron affinity, electronegativity, polarizability.</p> <p>1.2 Molecular Structure & bonding: Lewis structures, VSEPR model, the basic shapes. Valence bond theory: the hydrogen molecule, homonuclear diatomic & polyatomic molecules; hybridisation. molecular orbital theory: approximation, bonding & antibonding orbitals. Homonuclear diatomic & Heteronuclear diatomic molecules.</p> <p>2. Molecular Symmetry:</p> <p>2.1 Symmetry elements</p> <p>2.2 Symmetry operations, equivalent symmetry elements and equivalent atoms, symmetry point groups with examples, point groups of higher symmetry, systematic procedure for symmetry classification of molecules and illustrative examples,</p> <p>2.3 Dipole moment, optical activity and point groups.</p> <p>3. Solid state chemistry</p> <p>3.1 Structures of solids: crystal structures, lattices & unit cells, close packing of spheres, holes in closed-packed structures.</p> <p>3.2 Structures of metals & alloys: polytypism, nonclosed-packed structures, polymorphism of metals, atomic radii of metals, alloys, substitutional solid solutions, interstitial solid solutions of non-metals, intermetallic compounds.</p> <p>3.3 Ionic solids: Basic characteristic structures of ionic solids, the rationalization of structures, ionic radii, radius ratio, structure maps, the energetics of ionic bonding, lattice energy.</p>	<p>9 hr</p> <p>4 hr</p> <p>6 hr</p>

	<p>4. Coordination Chemistry</p> <p>4.1 Introduction, representative ligands, nomenclature,</p> <p>4.2 Constitution & geometry, low coordination numbers, intermediate coordination numbers, higher coordination numbers, polymetallic compounds.</p> <p>4.3 Isomerism & chirality in square planar & octahedral complexes, ligand chirality.</p> <p>4.4 Thermodynamics of complex formation: formation constants, chelate & macrocyclic effects, steric effects & electron delocalization.</p> <p>4.5 Electronic properties of metal complexes: CFT applied to octahedral and tetrahedral complexes, magnetic moments/CFSE. Electronic spectroscopy: basic concepts, interpretation of spectra of d^1 & d^2 ions (Orgel diagram for octahedral and tetrahedral complexes).</p> <p>5. Organometallic Chemistry</p> <p>5.1 Introduction to organometallic chemistry, nomenclature, stability and inert gas rules (neutral atom and donor pair electron count methods).</p> <p>5.2 Ligands CO & phosphines, homoleptic carbonyls/synthesis/properties/ oxidation-reduction of carbonyls/ basicity/reactions of CO/spectroscopic properties of metal carbonyls.</p> <p>5.3 Oxidative addition and reductive elimination.</p> <p>6. Basic Bioinorganic Chemistry</p> <p>6.1 Macronutrients/micronutrients. Role of elements in biology. Metal ion transport role.</p> <p>6.2 Definition of metallobiomolecules / metalloporphyrins, structure of porphine and heme group, examples of metalloenzymes of copper and zinc.</p> <p>7. Acids and Bases</p> <p>7.1 Brönsted Acidity, proton transfer equilibria in water, solvent levelling, solvent system definition if acids & bases, characteristics of Brönsted acids,</p> <p>7.2 Periodic trends in aqua acid strengths, non-aqueous solvents, Lewis acidity, hard & soft acids and bases, solvents as acids & bases, superacids & superbases.</p>	<p>5 hr</p> <p>4 hr</p> <p>3 hr</p> <p>5 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

---	--	--

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels so as to have basic knowledge of experimental chemistry.	No. of lectures
Course Objectives:	Students shall be trained in the preparation of coordination compounds / double salts, understanding of redox chemistry, determination of metal content and degree of hydration, and determination of the formula of synthesized compounds. Students will be given hands-on experience in using colorimeter / UV-Vis spectrophotometer while performing instrumental analysis.	
Course Outcomes:	1. Students should be in a position to: i) set up and perform inorganic synthesis ii) isolate and purify crystalline product. iii) develop skills for compound characterization iv) determine the metal content by titrimetry / gravimetry /colorimetry.	
Content:	<p>Synthesis of inorganic compounds (any six)</p> <ol style="list-style-type: none"> 1. $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ 2. $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ 3. $[\text{Co}(\text{NH}_3)_3(\text{NO}_2)_3]\text{Cl}_3$ 4. $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 5. $\text{K}_3[\text{Cr}(\text{SCN})_6] \cdot 4\text{H}_2\text{O}$ 6. $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot 3\text{H}_2\text{O}$ 7. $[\text{Cr}(\text{OAc})_2]_2 \cdot 2\text{H}_2\text{O}$ 8. Potash alum from scrap aluminium 9. Zinc iodide (Redox synthesis) <p>Quantitative estimations/determinations (any six)</p> <ol style="list-style-type: none"> 1. Estimation of Ni in $[\text{Ni}(\text{NH}_3)_6]\text{Cl}_2$ titrimetry/gravimetry 2. Estimation of Co in $[\text{Co}(\text{en})_3]\text{Cl}_3 \cdot x\text{H}_2\text{O}$ volumetrically 3. Estimation of oxalate in $\text{K}_3[\text{Al}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ or $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ 4. Estimation of nitrite by redox titration 5. Estimation of calcium in calcite ore 6. Estimation of copper in gun metal alloy or Devarda's alloy iodometrically 7. Estimation of Cr in chrome alum and $\text{K}_3[\text{Cr}(\text{C}_2\text{O}_4)_3] \cdot x\text{H}_2\text{O}$ to determine degree of hydration. 8. Colorimetric determination of Cr or Ni 	<p>24 hr</p> <p>24 hr</p>
Pedagogy:	Students should be given suitable pre-lab and post-lab assignments and explanation revising the theoretical aspects of laboratory experiments prior to the conduct of each experiment. Each experiment should preferably be done individually by the students.

Programme: M. Sc. Part-I (Chemistry)

Course Code: ICO-401

Title of the Course: Topics in Inorganic Chemistry & Environmental Chemistry

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Student should have studied the courses in chemistry at F.Y. B.Sc., S.Y.B.Sc. and T.Y.B.Sc. levels and / or CHIC-401 course so as to have basic knowledge of Inorganic / environmental chemistry.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To provide fundamental aspects of transition & inner transition metals & their compounds.2. To provide knowledge of main group elements of the periodic table & their compounds3. To introduce various global phenomenon's of atmosphere & environment, follow directive of the Supreme Court in 1993 to introduced environmental education at all levels, have a fair knowledge on the various global activities to justify permissible or adverse, so that future generation are not adversely affected.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in position to understand fundamentals / usefulness of transition & inner transition metals.2. Students should be in position to understand chemistry main group elements.3. Students shall be aware of the maintenance of healthy living atmosphere on the globe.	
Content:	<p style="text-align: center;">SECTION-I</p> <p>1. Chemistry of transition & inner transition elements</p> <p>1.1 Transition elements: IUPAC definition of transition elements, occurrence, physical & chemical properties, noble character, metal oxides & oxido complexes, examples of metal-metal bonded clusters.</p> <p>1.2 Inner transition elements: Lanthanides, occurrence, properties, oxidation states, electronic structure, colour and spectra, magnetic properties, lanthanide contraction, compounds of lanthanides. Actinoid chemistry, general trends.</p> <p>2. Main group elements and their compounds</p> <p>2.1 Boron group: Compounds of boron:- borazine and boron nitride, synthesis, properties, structure & bonding. Borates: classification, structures & examples.</p> <p>2.2 Carbon group: Allotropes of carbon including C₆₀, intercalation compounds of graphite, carbides. Compounds of silicon: silicates, zeolites & silicones.</p> <p>2.3 Nitrogen group:- Introduction: oxides & oxyacids of nitrogen. 2.4 Oxygen group: oxyacids & oxohalides of S, S₄N₄ ring compounds: synthesis, properties, structure & bonding.</p>	<p>9 hr</p> <p>9 hr</p>

	<p style="text-align: center;">SECTION-II</p> <p>1. Atmosphere Structure and properties of the atmosphere, composition of atmosphere and vertical temperature behaviour, lapse rate and temperature inversion.</p> <p>2. Air Pollution Classification of air pollutants and photochemical reactions in the atmosphere Common air pollutants (e.g. CO, NO_x, SO₂, hydrocarbons and particulates) (a) sources (b) physiological and environmental effect (c) monitoring, d) various remedial & technological measures to curb pollution. Air quality standards.</p> <p>3. Water pollution Importance of buffer & buffer index in waste water treatments. Chemical, physical & biological characteristics of water pollution, specific & non-specific characterization of water. DO, BOD, COD, and chlorine demand, typical water treatment & waste water treatment (Municipal).</p> <p>4. Treatment of Industrial wastes Electroplating industry, fertilizer industry and pharmaceuticals industries.</p> <p>5. Biogeochemical cycles: Carbon and Nitrogen cycles nature</p>	<p>2 hr</p> <p>7 hr</p> <p>5 hr</p> <p>2 hr</p> <p>2 hr</p>
Pedagogy:	Mainly lectures / tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCC-401

Title of the Course: Structure, reactivity, stereochemistry and reaction mechanism

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	3. Introduction of various concepts based on molecular orbital theory. 4. Introduction of topicity, prostereoisomerism and chemo-, regio- and stereoselectivity in organic reactions. 5. Learning mechanistic aspects of various type of reactions in organic synthesis.	
Course Outcomes:	5. Students should be in a position to evaluate effect of delocalization of electrons & presence or absence of aromaticity in organic compounds. 6. Students should be in a position to apply various concepts in stereochemistry to understand stereochemical output in a reaction. 7. Students shall be in a position to understand/propose plausible mechanism of organic reactions.	
Content:	1. Molecular orbitals and delocalized chemical bonding: Qualitative description of Molecular orbitals of simple acyclic and monocyclic Systems, Frontier molecular orbitals, Conjugation, cross conjugation, resonance, hyperconjugation and tautomerism (types and examples), Aromaticity: Origin of Huckel's rule, examples of aromatic, non-aromatic and antiaromatic compounds; concept of Mobius aromaticity. 2. Structure & Reactivity: Acidity, basicity and pKa of organic compounds; Acid and base strengths; HSAB concept & Factors affecting it, Effect of structure & medium on acid and base strength, Concept of superacids and superbases, Electrophilicity & Nucleophilicity, Examples of ambident nucleophiles & electrophiles. (Including revision of aromatic electrophilic and nucleophilic substitution) 3. Stereochemistry: Brief revision of configurational nomenclature: R & S; D & L; E & Z; cis & trans and <i>syn</i> & <i>anti</i> nomenclature. Chirality in molecules with two and more chiral centres. Conformational analysis of open chain compounds (Butane, 2, 3-butane diol, 2,3-dibromobutane etc.). <i>Erythro</i> and <i>threo</i> nomenclature. Topicity and Prostereoisomerism: Topicity of ligands and faces-homotopic, enantiotopic and Cram's rule / diastereotopic ligands and faces. Introduction to chemoselective, regioselective and stereoselective reactions. Stereochemistry of <i>cis</i> - and <i>trans</i> -decalins, conformation and reactivity of cyclohexane and substituted cyclohexanes, cyclohexene / cyclohexanone. 4. Reaction Mechanism: Brief revision of carbocations, carbanions, free radicals, carbenes and nitrenes with reference to generation, structure, stability and reactivity; Types of mechanisms, types of reactions, thermodynamic and kinetic control. The Hammond postulate and principle of microscopic reversibility, Methods of determining reaction mechanisms like- 1) Identification of products,	06 hr 06 hr 08 hr 06 hr

	<p>2) Determination of the presence of intermediates (isolation, detection, trapping and addition of suspected intermediate, 3) Isotopic labelling, 4) Stereochemical evidence, 5) Kinetic evidence and 6) Isotope effect (at least two reactions to exemplify each method be studied)</p> <p>5. Aliphatic Nucleophilic substitution: Brief revision of nucleophilic substitutions with respect to Mechanism, Various factors affecting such reactions; The Neighbouring Group Participation (NGP)/ Anchimeric assistance: General approach to various NGP processes; NGP by unshared/lone pair of electrons; NGP by π-electrons; NGP by aromatic rings (formation of phenonium ion intermediate); NGP by sigma bonds with special reference to bornyl and nor-bornyl system (formation of non-classical carbocation)</p> <p>6. Elimination reactions: The E2, E1 and E1cB mechanisms. Orientation of the double bond, Saytzeff and Hofmann rule. Effects of changes in the substrate, base, leaving group and medium on 1) overall reactivity, 2) E1 vs. E2 vs. E1cB and 3) elimination vs substitution, Mechanism and orientation in pyrolytic <i>syn</i> elimination (various examples involving cyclic and acyclic substrates to be studied).</p>	<p>06 hr</p> <p>04 hr</p>
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-I (Chemistry)

Course Code: OCO-401

Title of the Course: Synthetic Organic Chemistry I

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses / topics in Organic Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels as well as the course CHOC-401 so as to have basic knowledge of organic nomenclature and basic principles.	
Course Objectives:	1. Introduction to concepts of functional groups and their interconversion 2. Learning mechanistic concepts of carbon-carbon bond making by nucleophilic addition to carbonyl group 3. Learning mechanistic aspects of various oxidation & reduction processes used in organic syntheses.	
Course Outcomes:	1. Students should be in a position to choose appropriate oxidizing agent for oxidation of a particular functional group. 2. Students should be in a position to choose appropriate reducing agent for reduction of a particular functional group. 3. Students shall be in a position to understand/propose plausible mechanism of organic reactions. 4. Student should be able to choose appropriate nucleophilic addition reaction for making carbon-carbon bond.	
Content:	<p>1. Oxidation reactions: Oxidation of organic compounds using chromium (PCC, PDC) and manganese compounds, Oppenauer oxidation, Swern oxidation, ozonolysis. Other methods of oxidation such as selenium dioxide, Pb(OAc)₄, HIO₄, peracids, peroxides, OsO₄, RuO₄, DMSO (Swern) sodium bromate / CAN & NaOCl, DDQ, Prevost's reagent and Woodward Conditions; Catalytic oxidation over Pt, Photosensitised oxidation of alkenes, oxidation with molecular oxygen, aromatization, silver based reagents.</p> <p>2.Reduction reactions: Reduction of organic compounds using hydride-transfer reagents and related reactions : MPV reduction, NaBH₄, Trialkylborohydrides, LAH & lithium hydridoalkoxyaluminates, mixed LAH-AlCl₃ reagents, DIBAL and reduction with borane and dialkylboranes, Enzymatic reduction involving liver alcohol dehydrogenase/NADH & Bakers' yeast, catalytic hydrogenation, Dissolving metal reductions including acyloin condensation, Clemmensen reduction and Birch reduction, Other methods of reduction: Wolff-Kishner, Raney Ni desulphurisation, di-imide.</p> <p>3.Halogenation: Formation of Carbon Halogen bonds: Substitution in saturated compounds, alcohols, carbonyl compounds, substitution at allylic and benzylic compounds, bromodecarboxylation (Hunsdiecker reaction), Finkelstein reaction, iodolactonisation.</p>	<p>11 hrs</p> <p>9 hrs</p> <p>5 hrs</p>

	4. Esterification, amide preparation and hydrolysis: (study of different mechanisms and reagents)	6 hrs
	5. Name reactions: Knoevenegel Reaction, Claisen, Darzen, Stobbe, Perkin, Aldol, Benzoin, Pechmann condensation.	5 hrs
Pedagogy:	Mainly Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent.

Number of Credits: 03

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in chemistry at F.Y B.Sc, S.Y B.Sc & T.Y B.Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	6. Introduction of various concepts on thermodynamics. 7. Introduction of electro chemistry and kinetics. 8. Learning quantum chemistry.	
Course Outcomes:	8. Students should be in a position to understand various concepts in physical chemistry. 9. Students should be in a position to apply these concepts during the lab course in physical chemistry. 10. Students shall be in a position to answer the NET/SET examination questions based on these topics.	
Content:	<p>1.Thermodynamics</p> <p>1.1 Thermodynamic properties: Gas laws, Real gasses, Boyle temperature, Critical temperature, State and path properties. Intensive and extensive properties. Exact and inexact differentials. Internal energy, enthalpy, entropy, free energy and their relations and significances. Maxwell relations. Thermodynamic equations of state.</p> <p>1.2 Joule-Thomson effect. Joule-Thomson coefficient for van der Waals' gas. Joule-Thomson effect and production of low temperature, adiabatic demagnetization, Joule-Thompson coefficient, inversion temperature.</p> <p>1.3 The third law of thermodynamics. Need for the third law. Apparent exceptions to third law. Application of third law. Use of thermodynamic functions in predicting direction of chemical change. Entropy and third law of thermodynamics.</p> <p>1.4 Phase equilibria: Phase rule, Discussion of two component systems forming solid solutions with and without maximum or minimum in freezing point curve. Systems with partially miscible solid phases.</p> <p>1.5 Three component systems: Graphical representation. Three component liquid systems with one pair of partially miscible liquids. Influence of temperature. Systems with two pairs and three pairs of partially miscible liquids. The role of added salts.</p> <p>2.Electrochemistry</p> <p>2.1 EMF series, decomposition potential and overvoltage, electronegativity, basic principles, completeness of deposition, Separation with controlled potentials, constant current electrolysis, composition of electrolyte, potential buffers, physical characteristics of metal deposits.</p> <p>2.2 Electroplating and electroless plating, electrosynthesis.</p> <p>2.3 Concepts of acid-base aqueous and non-aqueous solvents, hard and soft acid-base concept and applications.</p>	<p>10 hrs</p> <p>06 hrs</p>

	3.Chemical Kinetics 3.1 General introduction to various types of order of reaction including fractional order, Molecularity of the reaction. 3.2 Introduction to reversible and irreversible reactions and reactions leading to equilibrium. Van'tHoffs equation and analysis of Gibbs free energy of equilibrium reactions. 3.3 Collision Theory and Maxwell Boltzmann distribution of energies of colliding molecules(derivationnotrequired). The concept of collisional cross section and reactive cross section and its significance. 3.4 Comparative study of transition state and collision state theory (derivation not required). 3.5 Free radical reactions, Complex reactions such as acetaldehyde decomposition and reaction between H ₂ and Br ₂ , Homogeneous reactions and acid-base catalysis. 3.6 Elementary enzyme reactions.	07 hrs
	4. Quantum Chemistry 4.1 Operators, Functions, Eigen value equations, Postulates. 4.2 Schrodinger equation, application to simple system viz. free particle, particle in one dimensional, two dimensional and three dimensional box (quantization, separation of variables, degenerate wave functions). 4.3 Hydrogen like atoms, Schrodinger equation and its solutions, atomic orbital wave functions and interpretation. 4.4 Hückel MO theory, Secular equations, Secular determinant, delocalization energy, charge density, π-bond order, free valence, applications to C ₂ H ₄ , C ₃ H ₅ (radical), C ₄ H ₆ , C ₄ H ₄ , C ₆ H ₆ , C ₆ H ₈	13 hrs
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers /assignments / presentations / self-study or a combination of some of these may be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-I (Chemistry)

Course Code: PCC-402 Title of the Course: Laboratory Course in Physical Chemistry

Number of Credits: 02

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Chemistry at F Y B Sc, S Y B Sc & T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various concepts on thermodynamics. 2. Introduction of electro chemistry and kinetics.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry by conducting experiments. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	1. To study the kinetics of hydrolysis of ethyl acetate and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 2. To study the kinetics of the reaction between Potassium persulphate (K ₂ S ₂ O ₈), and Potassium iodide (KI), and to determine a) Energy of activation b) Entropy of activation and c) Free energy change. 3. To determine the order of reaction between potassium persulphate and potassium iodide by graphical, fractional change and differential methods. 4. To determine the degree of hydrolysis of salt of weak base and strong acid using conductometer. 5. To determine the composition of a mixture of acetic acid, dichloroacetic acid and hydrochloric acid by conductometric titration. 6. To determine the dissociation constants of a dibasic acid and obtain derivative plot to get equivalence point. 7. To determine the dissociation constants of a tribasic acid (Phosphoric acid) obtain derivative plot to get equivalence point. 8. To determine formal redox potential of Fe ²⁺ /Fe ³⁺ and Ce ³⁺ /Ce ⁴⁺ system obtain derivative plot to get equivalence point. 9. To study the three component system such as toluene, ethanol and water. 10. To study the three component system such as acetic acid, chloroform; and water and obtain tie line. 11. To determine the molecular weight of polyvinyl alcohol by viscosity measurement. 12. To determine the molecular weight of polystyrene by viscosity measurement.	48 hrs
Pedagogy:	Lectures / tutorials / seminars / term papers / assignments / presentations / self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.	
References/ Readings	1. A. Finlay & J.A. Kitchener, " <i>Practical Physical Chemistry</i> ", Longman 2. F. Daniels & J.H. Mathews, " <i>Experimental Physical Chemistry</i> ", Longman. 3. A.M. James, " <i>Practical Physical Chemistry</i> ", 4. D.P. Shoemaker & C.W. Garland, " <i>Experimental Physical Chemistry</i> ", McGraw-Hill.	

Effective from AY: 2018-19

Prerequisites for the course:	Should have studied the courses in Physical Chemistry at F Y B Sc, S Y B Sc and T Y B Sc levels so as to have basic knowledge of Physical Chemistry and basic principles.	
Course Objectives:	1. Introduction of various mathematical concepts for Chemistry. 2. Introduction of topics viz. magnetic materials and properties, photochemistry, Nano materials.	
Course Outcomes:	1. Students should be in a position to understand various concepts in physical chemistry. 2. Students should be in a position to apply these concepts during the lab course in physical chemistry. 3. Students shall be in a position to answer the NET / SET examination questions based on these topics.	
Content:	<p>1.Mathematical Preparations:</p> <p>1.1 Introduction to various functions and function plotting (exponential, logarithmic, trigonometric etc.), functions of many variables. Complex numbers and complex functions.</p> <p>1.2 .Linear equations, vectors, matrices and determinants.</p> <p>1.3 Basic rules of differentiation and integration, Partial differentiation, location and characterization of critical points of a function, Regression methods, curve fitting.</p> <p>1.4 Introduction to series, convergence and divergence, power series, Fourier series, Fourier transformations and Numerical methods</p> <p>2.Magnetic Properties</p> <p>2.1 Types of magnetism (dia, para, ferro, antiferro and ferrimagnetism) Magnetic susceptibility and its determination.</p> <p>2.2 Magnetization curves and hysteresis, magnetic anisotropy, magnetic exchange interactions, Neel temperature and magnetic transition.</p> <p>2.3 Ceramic magnetic materials, Applications of magnetic Materials</p> <p>3.Photochemistry:</p> <p>3.1 Absorption and emission of radiation of photochemical interest. Einstein's equation.</p> <p>3.2 Jablonskii's diagram illustrating fluorescence and phosphorescence.</p> <p>3.3 Prompt and Delayed Fluorescence. Factors affecting Fluorescence life time and quantum yield.</p> <p>3.4 Flash photolysis and lasers. Photosensitised reactions and photosynthesis.</p> <p>4. Nanomaterials:</p> <p>4.1 Introduction, Chemical synthesis and methods of structural characterization.</p>	<p>18 hrs</p> <p>08 hrs</p> <p>06 hrs</p> <p>04 hrs</p>

	4.2 Areas of application, Societal health and environmental impact.	
Pedagogy:	Mainly lectures & tutorials. Seminars / term papers / assignments / self-study / or a combination of some of these can be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-501

Title of the Course: Fundamentals of Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge about difference between analytical chemistry and chemical analysis, role of analytical chemist, differences between conventional method of analysis and instrumental methods.	
Course Objectives:	<ol style="list-style-type: none">1. Introduction to the various chemical method of analysis, details of underlying principle of chemical methods, advantages and limitations2. Application of chemical methods for qualitative and quantitative estimation	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand basic principle behind different conventional method of analysis.2. Student should understand the limitation of method of analysis, should be in a position to choose for appropriate chemical method for particular analysis3. Students should be in a position to understand the basic chemistry on which the method of analysis based on.	
Content:	<p>1 Acid-Base Titrations Theory of acid-base indicators for Acid-Base titrations; colour change; range of indicator; selection of proper indicator; indicator errors; neutralization curves for strong acid-strong base, weak acid-strong base and weak base-strong acid weak acid-weak base titrations; poly functional acids and bases; titration curves for poly functional acids and bases; titration curves for amphoteric species; determining the equivalence point; feasibility of acid - base titrations; magnitude of the equilibrium constant; effect of concentration; typical applications of acid-base titrations.</p> <p>2 Precipitation titrations Introduction; feasibility of precipitation titrations; titration curves; effect of titrant and analyte concentration on titration curves; effect of reaction completeness on titration curves; titration curves for mixture of anions; indicators for precipitation titrations; the Volhard, the Mohr and the Fajans methods</p> <p>3 Complexometric titrations The complex formation reactions; stability of complexes; stepwise formation constants; organic complexing agents; amino carboxylic acid titration; EDTA; acidic properties of EDTA; EDTA complexes with metal ions; equilibrium calculations involving EDTA in solution; condition of formation constants; EDTA titration curves; effect of other complexing agents on EDTA; factor affecting the titration curves; completeness of reaction; indicators for EDTA titrations; theory of common indicators; titration methods using EDTA- direct titration, back titration and displacement titration; indirect determinations; titration of mixtures; selectivity, masking and demasking agents; applications of EDTA titrations- hardness of water; magnesium and Al in antacids; magnesium, manganese and zinc in a mixture.</p>	<p>10 hrs</p> <p>3hrs</p> <p>8hrs</p>

	4. Basic concepts in Electrochemical Titrations Faradic and non-Faradic currents; reversible and irreversible cells; EMF series; standard electrode potential; Nernst equation; calculation of cell potential; effect of current; ohmic potential; polarization; decomposition potential; over voltage; concentration polarization; mechanism of mass transport; introduction to potentiometric methods 5. Redox titrations Redox Titrations: Equilibrium constants for redox reactions- electrode potentials in equilibrium systems; calculation of equilibrium constants; redox titration curves- formal redox potentials; derivation of titration curves; factors affecting the shape of titration curves concentration; completeness of reaction; titration of mixtures- feasibility of redox titrations; detection of end point and redox indicators; structural aspect of redox indicators; specific and nonspecific indicators; choice of indicator; potentiometric end point detection; sample preparation- pre-reduction and pre-oxidation. 6. Radioimmunoassay Radioimmunoassay; its principle and applications; instrumentation for radio bioassay; clinical application of the radioimmunoassay of insulin, estrogen and progesterone; receptor techniques of breast cancer; enzyme- linked immunosorbent assay; principles; practical aspects; applications. 7. Gravimetric analysis Introduction; properties of precipitates and precipitating reagents; completeness of precipitates; super saturation and precipitate formation; particle size and filterability of precipitates; colloidal precipitates; crystalline precipitates; purity of the precipitate; co-precipitation, post precipitation; conditions for precipitation; fractional precipitation; precipitation from homogenous solution; organic reagent as precipitants-dimethyl gloxime, oxine, cupferon, salicyldoxime, washing of precipitates; drying and ignition of precipitates; calculation of results from gravimetric data; applications.	3 hrs
		4 hrs
		3 hrs
		5hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Title of the Course: Techniques in Chemical Analysis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques such as colorimetry, pH-metry, emission techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
<u>Course Objectives:</u>	1. Introduction of various experimental techniques for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
<u>Course Outcomes:</u>	1. Students should be in a position to differentiate between various analytical techniques based on their theory and sensitivity achieved. 2. Exposure to various electrochemical and optical techniques for its application to qualitative and quantitative estimation at trace level.	
<u>Content:</u>	1. Principles and practise of optical analytical techniques –Part-1 1.1. Nephelometry and Turbidimetry: Introduction to principle, instrumentation and application of nephelometry, turbidimetry. Factors affecting measurement, choice between nephelometry and turbidimetry; turbidimetry and colorimetry; nephelometry and fluorimetry; applications of nephelometry and turbidimetry. 1.2. Introduction, principle and Instrumentation of Polarimetry; application of optical rotation method in rate constant determination; acid- catalyzed muta rotation of glucose; inversion of cane sugar; relative strengths of acids. Introduction to terms such as optical rotatory dispersion (ORD), plan curves, cotton effect curves, circular dichroism, octant rule for ketones.	10hrs
	2. Principles and practise of optical analytical techniques –Part-2 2.1. Principles and practices of Spectrophotometric Analysis: Introduction; law of absorption; absorbance and transmittance spectrum; technique for colour comparison; spectrophotometer instrumentation- single and double beam spectrophotometer; applications 2.2. Principles of Emission Techniques: Theory; excitation techniques; electrodes and their shapes; Quantitative and qualitative application, brief introduction to ICP-MS	10hrs
	3. Principles and practise of electro analytical and thermal techniques 3.1. Introduction to Ion selective electrodes; construction, application and selectivity coefficient of Ion selective electrode; pH measurement; buffer solution; glass electrode; instrument for pH measurement. 3.2. Thermoanalytical Methods: Thermogravimetry, Differential Thermal Analysis (DTA), and Differential Scanning Calorimetry: DSC 3.3. Basic aspects of conductometric titration; types of conductometric titration; advantages and disadvantages of conductometric titration;	16hrs

	<p>Introduction; theory; instrumentation; advantages, disadvantages and applications of High frequency titrations.</p> <p>3.4. Karl Fischer Titration: Introduction; theory; instrumentation; advantages, disadvantages and applications; Karl Fischer reagent- Introduction; determination of water content in industrial samples.</p>	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2019-20

Prerequisites for the course:	Should have knowledge of basic analytical techniques such as chromatography, electro-analytical techniques and data handling at MSc part-I level.	
Course Objectives:	1. Introduction of various statistical approach used in analytical data handling 2. Introduction of different separation techniques used for qualitative, quantitative estimation	
Course Outcomes:	1. Students should be in a position to understand principle behind different purification techniques. 2. Students should be in a position to select the separation techniques for purification of analytes from interferents. 3. To understand the HPLC method development and application in qualitative and quantitative analysis	
Content:	<p>1. Basic Separation Technique:</p> <p>1.1. General aspects of separation techniques-role of separation technique in analysis;</p> <p>1.2. Separating the analyte from interferents</p> <p>1.3. General theory of separation efficiency: Separation factor</p> <p>1.4. Classifying separation techniques: Separations based on Size; Separations based on mass or density, Separations based on complexation reactions (Masking); Separations based on a change of state; Separations based on a partitioning between phases. (Note: Following techniques shall be discussed as representative example)</p> <p>1.5. Basic principles of distillation; theory of vacuum, steam, azeotropic and fractional distillation.</p> <p>1.6. Fractionation by solvent extraction: based on chemical nature and based on polarity of analyte.</p> <p>1.7. Centrifugation techniques: Sedimentation velocity, Analytical and preparative centrifugation; Density gradient centrifugation; applications in separation.</p> <p>2. Chromatographic Methods:</p> <p>2.1. Introduction to chromatography: definitions, theories, principles of chromatographic technique, terms and parameters used in chromatography, classification of chromatographic methods, Partition versus adsorption chromatography, development of chromatograms, qualitative and quantitative analysis by chromatography;</p> <p>2.2. Planar Chromatography (Paper and thin layer):</p> <p>2.2.1. Paper Chromatography- introduction, principle, theory, types (ascending, descending, circular, two dimensional paper chromatography); techniques; choice of solvent; multiple development, qualitative and quantitative measurement applications;</p> <p>2.2.2 Thin Layer Chromatography (TLC)- definition; mechanism; efficiency of thin layer plates; methodology (technique); criteria</p>	<p>6 hrs</p> <p>24hrs</p>

	<p>for selection of stationary and mobile phases (numerical to calculate elution strength of mixed solvents used as mobile phase); choice of adsorbents; preparation of plates; spotting (spot capacity); development of chromatogram; identification and detection using physical and chemical methods; reproducibility of R_f values and improving resolution; Two-dimensional TLC; comparison of TLC with paper chromatography, column chromatography, thin layer ionophoresis and electrophoresis; Qualitative, quantitative evaluation and applications;</p> <p>2.3. High-performance TLC (HPTLC): introduction, principle, theory, classification (classical, high performance, ultra, preparative HPTLC); Difference between TLC and HPTLC with respects to the parameters; scanning densitometer; Quantitative analysis using TLC-densitogram and applications.</p> <p>2.4. Gas Chromatography (GC): Instrumentation, selection of operating condition, choices of GC column, methods to prepare derivatives of samples (silylation, acylation, alkylation), working principle of GC detectors such as TCD, ECD, FID, Analysis of GC data and quantification methods such as normalizing peak area, internal std., external std, standard addition.</p> <p>2.5. Column Chromatography- definition; types (conventional, flash, LPLC, Dry column vacuum chromatography); principle; packing, loading, eluting and collecting eluent in the column chromatography and experimental requirements; theory of development; migration rates of solutes; band broadening and column efficiency; variables that affect column efficiency; Van Deemeter equation and its modern version; scale-up and thump rule for conventional column, qualitative and quantitative analysis; applications.</p> <p>2.6. Liquid-liquid partition chromatography (HPLC)- Introduction; selection of stationary and mobile phase; types of bonded phase chromatography-NPC and RPC and stationary phases used; reversed phase partition chromatography; steps in HPLC method development in partition chromatography- elution techniques (isocratic and gradient, ion pairing agents, buffer agents, organic modifiers); optimization of capacity factor, gradient selectivity factor and column plate numbers; numerical on method development using Snyder's polarity index. Preparative vs analytical HPLC; Chiral chromatography- Pirkle stationary phases, examples of enantiomer separation such as ibuprofen, calculation of enantiomeric excess. Choosing detectors- working principle of RI, UV-Vis, conductivity and ELSD.</p> <p>2.7. Size Exclusion Chromatography: definition; theory; principle; types; stationary phases in gel chromatography; physical and chemical characteristics of gel, mechanism of gel permeation chromatography (GPC); instrumentation of GPC; applications of GPC- determination of molecular weight of polymer with numericals.</p> <p>2.8. Supercritical-Fluid Chromatography: introduction; important properties of supercritical-fluids; instrumentation and variables, SFC column vs other column, applications.</p>	
--	---	--

	3. Electrophoresis: 3.1. Theory of electrophoresis; Type of electrophoresis- Free solution and supporting medium electrophoresis, paper electrophoresis, capillary electrophoresis and gel electrophoresis. 3.2. Capillary electrophoresis-instrumentation, sample introduction in CE, types of CE methodology, electrophoretic mobility and electroosmotic mobility, total mobility, efficiency and resolution in CE column, numericals. 3.3. Gel electrophoresis - types of gel, Polyacrylamide gel electrophoresis PAGE, Agarose GE, factors affecting separation; 3.4. Staining and detecting electrophoresis band; 3.5. Separation of neutral molecule by MEKC; 3.6. Separation and determination of Vitamin B-complex by using CZE and MEKC.	6 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-504

Title of the Course: Spectral methods of analysis

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques at B. Sc. or M. Sc. Part I level for better understanding of the course content	
Course Objectives:	1. Introduction of various spectral methods for analysis. 2. Evaluate the utility of various analytical techniques as a qualitative and quantitative tool.	
Course Outcomes:	1. Students should be in a position to understand theory and instrumentation of various spectral methods of analysis. 2. Understanding application of studied methods for qualitative and quantitative estimation at trace level.	
Content:	1. Automation of Analytical Method: An overview of automated system; definition; distinction between automatic and automated system; advantages and disadvantages by automation; types of automated techniques. Discrete and continuous automation, Introduction to Flow injection analysis.	5 hrs
	2. X-ray Absorption, Diffraction; Neutron Diffraction and Fluorescence Spectroscopy: Introduction; origin of X-rays; interaction of X-ray with matter; X-ray spectrometer; theory of X-ray absorption; X-ray diffraction by crystal; comparison of X-ray absorption with X-ray diffraction; Bragg's law; interpretation of X-ray diffraction powder pattern; calculation of lattice parameters; neutron diffraction introduction; theory; instrumentation and applications; X-ray fluorescence- introduction; applications. Introduction to Mossbauer spectroscopy; theory and application.	10hrs
	3. Molecular Fluorescence, Phosphorescence and Chemiluminescence Spectroscopy: Introduction; meaning of luminescence and chemiluminescence; principles of fluorescence, chemical structure and fluorescence; theory of molecular fluorescence; instrumentation- single and double beam filter fluorimeters, relationship between intensity of fluorescence and concentration; spectrofluorometer; phosphorimeter; factors influencing fluorescence and phosphorescence; basic differences in measurement of fluorescence and phosphorescence; advantages; limitations and precautions; selection of excitation wavelength for analysis; reporting fluorescence spectra; applications of fluorimetric analysis. Chemiluminescence: Introduction; principle; types; chemiluminescence with Luminol, instrumentation; measurement of chemiluminescence; quantitative chemiluminescence; Introduction to gas phase chemiluminescence analysis, chemiluminescence titrations and electro-chemiluminescence.	12hrs
	4. Microscopy: Chemical microscopy- microscope; parts and optical path; numerical aperture and significance; applications and qualitative and quantitative study;	9 hrs

	Electron microscopy- principle, operation, sample preparation, replicas, shadowing, application to analysis; electron probe analyzer, ion microscope; metallography- metallurgy, microscopic examination; specimen preparation and examination; interpretation of micrographs; SEM, TEM, AFM. Introduction to Magnetic resonance imaging (MRI) technique and Photo acoustic spectroscopy ; theory and applications	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACC-505

Title of the Course: Experiments in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses in Analytical Chemistry Practicals at MSc-I levels so as to have basic knowledge of quantitative analysis.	
Course Objectives:	1. Introduction of various experimental techniques for analysis. 2. Learning data analysis, handling and interpretation of spectra	
Course Outcomes:	1. Students should be in a position to use standardized material to determine an unknown concentration. 2. To gain experience with some statistics to analyse data in lab 3. Student should be in position to use different techniques for qualitative and quantitative estimation	
Content:	<p>This course consists of 7 units of experiments in various areas of Analytical chemistry. Minimum 14 experiments shall be carried out and at-least 2 experiments from each unit.</p> <p>UNIT 1: Analysis of Pharmaceutical Tablets/Samples</p> <ol style="list-style-type: none">1. Estimation of streptomycin in tablet sample by Maltol method2. Estimation of Ibuprofen / Paracetamol3. Estimation of sulphadiazine / sulphonamide4. Determination of moisture content in tablet powder by Karl Fischer titration <p>UNIT 2: Planar and column Chromatography</p> <ol style="list-style-type: none">1. Separation of alpha amino acids by paper chromatography and to study effect of mobile phase on resolution.2. Thin layer chromatography analysis of commercial available analgesic and to identify the active ingredients.3. Purification and determination of amount of paracetamol from commercial tablet by column chromatography4. Separation of a mixture of benzoin and benzil on silica gel column <p>UNIT 3: Ion exchange Chromatography and Solvent Extraction Method</p> <ol style="list-style-type: none">1. To determine the capacity of a cation exchange resin2. To separate organic mixture (acidic+basic+Neutral) by extraction3. To separation and estimate the zinc and nickel ions using an anion exchange resin4. To determine the Fe ion as Fe-oxine complex <p>UNIT 4: HPLC Analysis:</p> <ol style="list-style-type: none">1. HPLC analysis of benzaldehyde and benzyl alcohol using isocratic elution2. To study HPLC method development by using linear and stepwise gradient elution for binary system3. To analyze a mixture (benzene and toluene, anthracene and naphthalene) by Reverse phase-HPLC4. HPLC analysis of Analgesics in a commercial sample/tablet, Ibuprofen to develop and validate the analytical method of any one drug using HPLC	

	<p>UNIT 5: Gas Chromatographic Analysis:</p> <ol style="list-style-type: none"> 1. Quantitative analysis of a mixture of chloroform and carbon tetrachloride 2. Gas chromatographic analysis for a mixture of gases like O₂, N₂ and CO₂ <p>UNIT 6: Spectrophotometry Method:</p> <ol style="list-style-type: none"> 1. To determine pk value of methyl red indicator at room temperature 2. To determine the stoichiometry and stability constant of ferric salicylic acid complex by Job's method and mole ratio method 3. To determine the amount of each caffeine and benzoic acid from the soft drink by UV spectrophotometry. 4. To record UV absorption spectrum of acetone in n-hexane and in water to identify the various transition. <p>UNIT 7: Electrochemical Method:</p> <ol style="list-style-type: none"> 1. pH-metric determination of hydrolysis constant of aniline hydrochloride 2. pH-metric determination of the acid-base dissociation constant and isoelectric point of amino acid 	
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-501

Title of the Course: Bioanalytical and Forensic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the analytical chemistry at T Y B Sc (Chemistry) and M Sc part-I (Chemistry) levels.	
Course Objectives:	1. The purpose of this course is to provide basic understanding of medical laboratory clinical chemistry and forensic chemistry 2. Identify various types of evidence that may be collected at a crime scene including procedures for identification, collection, and analysis for the purpose of investigating and prosecuting crimes.	
Course Outcomes:	1. Apply principles of safety, quality assurance and quality control in clinical and forensic chemistry. 2. The students should be in position to select methods required for forensic and clinical sample analysis. 3. The students will be in a position to understand the principal and applications of various analytical methods used in clinical and forensic laboratory.	
Content:	1. Clinical Chemistry: 1.1. Composition body fluid; detection of abnormal levels of certain constituents leading to diagnosis of diseases; sample collection and preservation of physiological fluids; 1.2. analysis of physiological fluids- blood, urine and serum; estimation of blood glucose, cholesterol, urea, haemoglobin; urine-urea, uric acid, albumin, globulins, barbiturates, acid and alkaline phosphates;	7 hrs
	2. Human-nutrition: Estimation of enzymes, carbohydrates, essential amino acids, proteins and lipids.	4 hrs
	3. Food Analysis, Processing and Preservation: 3.1. Analysis of food such as milk, milk products, tea, coffee and beverages (soft drinks, alcoholic drinks), Flour, starch, honey, jams and edible oils. Analysis of preservatives, coloring matter, micronutrients. 3.2. Food processing and food preservation: Refining milling, canning, concentration, freezing Drying, pasteurisation sterilization irradiation.	8 hrs
	4. Forensic Science: Chemistry, Narcotics and toxicology 4.1. Narcotics and Psychotropic Substances Act: psychotropic substance; prohibition control; regulation offence and penalties. 4.2. Forensic Chemistry: Its role in crime; Types of cases received for Analysis; Procedures for sample selection, collection, preservation, identification. 4.3. Forensic chemical analysis of samples using classical and modern instrumental techniques: Analysis of alcohol and other spurious liquor, Examination of Petroleum products, Construction material for adulteration; Examination of burnt remains in arson cases; Analysis of dyes chemicals seized in crime; Types of explosives; commonly used explosives; their handling; analysis and	17hrs

	<p>identification of explosive residues.</p> <p>4.4. Narcotics: Definition; Narcotic drugs and Psychotropic; substances; Problems of drug abuse; drug addiction.</p> <p>4.5. Classification of Narcotic drugs;</p> <p>4.6. Identification of narcotic drugs by spot tests and other classical Methods for following drugs. (a) Narcotics- heroin and cocaine. (b) Stimulants- caffeine, amphetamines; (c) Depressants- Barbiturates, Benzodiazepines. (d) Hallucinogens- LSD</p> <p>4.7. Extraction of Narcotic drugs from different matrices; Isolation, purification, identification and estimation.</p> <p>4.8. Examination of Narcotic drugs using modern instrumental methods</p> <p>4.9. Toxicology: Definition; Its role in crime; Classification of poisons; commonly used poisons; signs and symptoms of poisoning; Sample collection, Handling and packing.</p> <p>4.10. Analytical Toxicology; Extraction of poisons from various matrices including visceral samples; Isolation; Purification identification and interpretation of findings. Use of both Classical and Modern Instrumental methods of chemical analysis of poisons.</p>	
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-502

Title of the Course: Calibration and Validation in Analytical Chemistry

Number of Credits: 3

Effective from AY: 2019-2020

Prerequisites for the course:	Students should have studied the theory/ instrumentation and application of some of the basic analytical techniques and statistical calculations related to topic. Knowledge of M.Sc.-Part I analytical courses is essential for better understanding of the course content	
Course Objectives:	1. Introduction of various aspect of calibration and validation 2. Study validation parameters and qualification of instrument	
Course Outcomes:	Students should be able to understand about calibration/validation and how it can be applied to industry and thus improve the quality of the products. The subject covers the complete information about basics of calibration & validation, types, methodology and application, the qualification of various equipment's and instruments.	
Content:	1. Calibration Significance of calibration in analytical chemistry. Standardizing methods; standards used, certified reference material. Blanks and controls; types and significance Statistical evaluation of analytical results; relative error, standard deviation, knowledge of q test, test of significance, linear Least Squares estimation and coefficient of regression Errors in calibration, Modes and protocols of calibration; External standard method, Standard addition method, Spiking, Internal standard method and standard bracket method. Introduction to common apparatus used in analytical laboratory and their calibration; volumetric glassware, Analytical Balances, pH meter, Oven and lab Refrigerator Excel-charts for calibration plot.	13 hrs
	2. Validation and qualification Introduction to validation, Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Validation and qualification, Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment. Regulatory requirements for analytical method validation International conference on harmonization (ICH) guideline Q2A Introduction to QA / QC, Safety Practices in a Chemical Laboratory	11 hrs
	3. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation	12 hrs

	Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-503

Title of the Course: Advanced Mass Spectrometry

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. part-I (Chemistry) levels.	
Course Objectives:	1. Study of various theoretical concepts related to mass spectroscopic techniques. 2. Introduction of tandem mass spectrometry techniques. 3. Learning interpretational aspects of spectral data obtained from hyphenated techniques	
Course Outcomes:	1. Students should be in a position to understand principle behind different ionizations sources. 2. Students should be in a position to select mass analysers and ionization sources for analysis of particular type of analyte. 3. Students should be in a position to deduce structures of simple to moderately complex molecules/biomolecules by combining the spectral data obtained from hyphenated techniques.	
Content:	1. Introduction Mass spectrometry principle, general instrumentation, general interpretation procedure for mass spectra;	2 hrs
	2. Ionization methods: 2.1. Gas Phase ionization: electron ionization (EI), chemical ionization (CI), Field ionization and field desorption (FI, FD) 2.2. Particle Bombardment: Fast atom bombardment (FAB); Secondary ion mass spectrometry (SIMS) 2.3. Atmospheric pressure ionization: electrospray ionization (ESI), atmospheric pressure ionization (APCI) 2.4. Laser Desorption: MALDI 2.5. Inorganic ionization sources: thermal ionization; Spark source; Glow discharge, Inductively couple plasma (ICP)	10 hrs
	3. Mass analyzers: 3.1. Characteristics of analysers: nominal mass, mass accuracy, resolving power, resolutions, numericals to calculate nominal and accurate mass 3.2. Magnetic, electromagnetic and double focusing 3.3. Single Quadrupole and triple quadrupole 3.4. Time of flight analyser 3.5. Ion cyclotron resonance analyzer, 3.6. hybrid instrumentation 3.7. Detectors: electron multiplier, photon multiplier, Faraday cup (Note: instrumentation, working principles, characteristic features, advantages, practical consideration shall be discuss).	8 hrs
	3. Hyphenated Techniques: 3.1. Coupled techniques; Interface and their characteristic features; Importance of hyphenation of two analytical techniques; 3.2. Introduction and instrumentation of following techniques: GC-FTIR, GC-MS, LC-MS, MS-MS (tandem) mass spectrometry (use of	8 hrs

	<p>stable isotopes), ICP-MS, TG-MS.</p> <p>3.3. Analysis of chromatogram obtained from hyphenated techniques: Total ion chromatogram (TIC), Extracted Ion chromatogram (XIC).</p> <p>4. Tandem Mass spectrometry applications:</p> <p>4.1. Pharmacokinetic studies: Fate of drug in living organisms, metabolite identification, biotransformation of ziprasidone</p> <p>4.2. Tandem MS and fragmentation pattern of following drugs: Paracetamol, 2-mercaptopyruvic acid, Sulfasalazine, Narcotics-amphetamine,</p> <p>4.3. Analysis of biomolecules-Protein and peptides: structure and sequence determination using fragmentation, solve problems based on MS/MS data.</p>	8 hrs
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Effective from AY: 2018-19

Prerequisites for the course:	Students should have studied the Concepts in Analytical Spectroscopy), Analytical techniques at MSC Semester I and II so as to have basic knowledge of environmental chemistry and instrumental analysis.	
Course Objectives:	<ol style="list-style-type: none"> 1. Introduction to environmental application of chemistry 2. Studying pollution from chemical perspective. 3. Creating awareness about environmental acts of India 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Develop social concern for pollution based on various chemical process 2. Evaluate the use of various analytical techniques in environmental control and monitoring 	
Content:	<p>1. Water pollution</p> <ol style="list-style-type: none"> 1.1 Constituents of aquatic life 1.2 Nature and types of water pollutants: heavy metals, inorganic pollutants, organic pollutants, pesticides, soaps and detergents, radioactive pollutants; Water standards in India [IS 10500 (2012)] 1.3 Soaps and detergents pollutants: Analysis of Soaps and detergents, general scheme of analysis, active ingredients, Test for soap (fatty acid salts), test for synthetic detergents 1.4 Municipal water treatment 1.5 Treatment of water for industrial use 1.6 Water conditioning: principle of coagulation and flocculation, softening, disinfection, demineralisation, fluoridation, chlorination, ozone treatment, electrodialysis 1.7 Wastewater treatment: pH, aerobic and anaerobic water treatment 1.8 Mercury pollution and estimation of organomercurials; 1.9 Analysis of: Dissolved oxygen (polarography and oxygen electrode), Chemical oxygen demand, Biochemical oxygen demand; 1.10 case study -DDT, Kepone, Minamata (any other) <p>2 Air pollution</p> <ol style="list-style-type: none"> 2.1 Introduction to atmospheric chemistry 2.2 Photochemical processes (ozone depletion) 2.3 Chain reactions in atmosphere 2.4 Oxidation process in atmosphere 2.5 Acid-base reaction in atmosphere 2.6 Sources and sinks of air pollutants 2.7 Effect of air pollutants on living and non-living things 2.8 Methods for sampling air pollutants 2.9 Air pollution problems- world and India 2.10 Sources -analysis control of: oxides of carbon, nitrogen and sulphur, H₂S 2.11 Organic compounds in atmosphere 2.12 Air act of India 1981 2.13 Greenhouse gases and global warming 2.14 Radioisotopes in air 2.15 Methods to monitor and control air pollution: scrubbers, filters, gravity and cyclone separators, absorption, adsorption, condensation, 	<p>10 hrs</p> <p>10 hrs</p>

	<p>flare tower, gas sensing</p> <p>2.16 Noise pollution</p> <p>2.17 Case study-Bhopal gas tragedy, nuclear disasters-Chernobyl and Fukushima</p> <p>3 Soil pollution</p> <p>3.1 Soil macrostructure and microstructure,</p> <p>3.2 Micro and macronutrients of soil</p> <p>3.3 Inorganic and organic matter in soil</p> <p>3.4 Reactions in soil</p> <p>3.5 Fertilisers in soil; Analysis of fertilizer (N, P, K)</p> <p>3.6 Excessive use of agrochemicals</p> <p>3.7 Waste and pollutants in soil</p> <p>3.8 Type of pesticides, degradation of pesticides in soil (chemical, photochemical biochemical), Analysis of pesticides,</p> <p>3.9 Soil pollution Sources, prevention and control</p> <p>3.10 Biochemical effects of pesticides; analysis of pesticides</p> <p>3.11 Plastic pollution</p> <p>3.12 Municipal garbage treatment</p> <p>4. Instrumental Techniques in environmental chemical analysis.</p> <p>4.1 Neutron activation analysis</p> <p>4.2 Anodic stripping voltammetry, (Mixture: Cu, Pb, Zn, Cd)</p> <p>4.3 atomic absorption spectroscopy, (Cu, Co, Cr)</p> <p>4.4 Flameless atomic absorption, (Hg, Pb,)</p> <p>4.5 Inductively-coupled plasma-emission spectroscopy (B,W)</p> <p>4.6 X-ray fluorescence</p> <p>4.7 Infrared and non-dispersive infrared spectroscopy (nitrates, carbonate, CO)</p> <p>4.8 Chemiluminescence (NO_x)</p> <p>4.8 Gas and liquid chromatography(NO_x, CO, CO₂, VOC)</p> <p>4.9 Ion-selective electrodes, (F, Ag, S, Ca)</p> <p>4.10 Ion chromatography-(mixture: Ni, Co and Cu; chloride, nitrate and sulphate)</p> <p>Above techniques shall be discussed with minimum one environmental application</p>	<p>8 hrs</p> <p>8 hrs</p>
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-505

Title of the Course: Problems on combined Spectroscopy

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Study of various theoretical concepts related to organic spectroscopic techniques. 2. Introduction of commonly used 2D NMR techniques. 3. Learning interpretational aspects of spectral data pertaining to IR, PMR, CMR and MS.	
Course Outcome	1. Students should be in a position to deduce structures of simple to moderately complex molecules by combining the spectral data obtained using two or more spectral techniques. 2. Students should be in a position to apply various concepts in organic spectroscopy (PMR, CMR, MS and 2D NMR) and generate/ predict PMR, CMR, MS and 2D NMR spectral data based on given structures of simple molecules.	
Content:	1. Electronic and Infrared Spectroscopy: basic concepts; Application of electronic and IR spectroscopy in structural elucidation of organic compounds	04 hrs
	2. NMR Spectroscopy: Theory of Nuclear magnetic resonance, quantum description of NMR, classical description of NMR, Types of NMR spectra, environmental effects of NMR Spectra, the chemical shift, Applications of proton NMR in qualitative and quantitative analysis (in general).	05 hrs
	3. ^{13}C –NMR spectroscopy: Introduction, proton coupled and proton decoupled ^{13}C - spectra. Off- resonance decoupling, APT & DEPT techniques; ^{13}C chemical shifts – factors affecting the chemical shifts – Homonuclear (^{13}C - ^{13}C J) and heteronuclear (^{13}C – ^1H , ^{13}C – ^2H J) couplings.	06 hrs
	4. Two-dimensional NMR spectroscopy: Introduction to 2D-NMR, Classification of 2D experiments- 2DJ resolved spectroscopy; interpretation of spectra of simple organic compounds using following 2D-NMR techniques-COSY, NOESY, HSQC, HMQC, HMBC, TOCSY and INADEQUATE	07 hrs
	5. Identification of organic compounds using combined spectral methods: UV, IR, PMR, CMR, 2D NMR, Mass <i>(Note: More emphasis shall be given for solving combined spectroscopic data for structural elucidation)</i>	14 hrs
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/	

	presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Analytical Chemistry)

Course Code: ACO-506

Title of the Course: Chemometrics

Number of Credits: 3

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the spectroscopy topics at T. Y. B. Sc. (Chemistry) and M. Sc. Part-I (Chemistry) levels.	
Course Objective:	1. Introduction of various chemistry software used in quantification and calculations 2. Study validation parameters and qualification of instrument	
Course Outcome	Students should be able to understand about various software in chemometric and how it can be applied to analysis and thus improve the quality of the products. The subject covers the complete information about software and their application in quantifications.	
Content:	<p>1. Introduction to Data and Statistics: Introduction; Univariate Statistics Review, Probability, Variance and Sampling, Linear Regression and Calibration Data, Digitization, and the Nyquist Theorem, Detection Limit, S/N ratio, and Signal Filtering; Review of Linear Algebra: Scalars, Vectors, and Matrices, Matrix Notation and Matrix Operations Orthogonality, Analysis of Variance (ANOVA) - 1 Variable, Analysis of Variance - 2 Variables; Introduction to MatlabTM: Program Basics and Layout, Matrix Operations in MatlabTM The Diary Command and Examples, ANOVA in MatlabTM; Experimental Design: Factorial Design, Simple <i>versus</i> Complex Models, Factorial Design in MatlabTM ; Half-Factorial Design.</p> <p>2. Multivariate Methods I: Introduction to various multivariate methods; the Six Habits of a Chemometrician; Principle Component Analysis (PCA); data pretreatment- Mean Centering and Normalization; PCA in MatlabTM.</p> <p>3. Multivariate Methods II: Classical Least Squares (CLS), CLS in MatlabTM; Inverse Least Squares (ILS).</p> <p>4. Multivariate Methods III: Multiple Linear Regression (MLR); Principle Component Regression (PCR); Partial Least Squares, Examples in MatlabTM; Summary of Multivariate Methods; Pattern Recognition- Supervised versus Unsupervised Pattern Recognition, K Nearest Neighbours (KNN); Soft Independent Modelling for Chemical Analysis(SIMCA), Summary of Pattern Recognition.</p> <p>5. Computers in Chemistry: The students shall learn how to operate a PC and run standard programs and packages like MS-WORD, EXCEL, ORIGIN, SIGMA PLOT, and CHEM SKETCH; to solve Chemistry numerical (numerical taken preferably from Physical Chemistry for plotting first and second derivative curves, linear plots); numerical from Analytical Chemistry, Chemical Kinetics, Electrochemistry, Spectroscopy and other related topics; writing the structures of inorganic and organic molecules, chemical equations and other</p>	<p>10 hrs</p> <p>05 hrs</p> <p>04 hrs</p> <p>07 hrs</p> <p>10 hrs.</p>

	interesting applications will be taught.	
Pedagogy:	lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

M Sc-II Inorganic chemistry
Semester III and IV Courses (Academic year 2019-2020 onwards)

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits
ICC 501	Coordination and organometallic Chemistry	3	ICO 501	Bioinorganic Chemistry	3
ICC 502	Materials Chemistry	3	ICO 502	Catalysis: The Basic Chemical concepts	3
ICC 503	Group Theory and Spectroscopy	3	ICO 503	Chemistry of P-Block Elements	3
ICC 504	Selected Topics in Inorganic Chemistry - I	3			
ICC 505	Experiments in Inorganic Chemistry	3	General Optional Courses		
			CGO-500	Dissertation	8
			CGO-501	Selected Experiments in Chemistry	8

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-501

Title of the Course: Coordination and organometallic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To make understand the electronic structure of compounds of d-block elements.2. To provide sufficient knowledge of CFT and MOT in coordination and organometallic compounds.3. To understand interpretation of magnetic and electronic properties of coordination compounds.4. To understand fundamental concepts of inorganic chemistry reaction mechanisms5. To provide knowledge on applications of organometallic compounds in homogenous catalysis.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the electronic structure of coordination and organometallic compounds.2. They will be well equipped with knowledge of CFT and MOT3. They will be in position to understand the magnetic and electronic properties.4. The concepts of inorganic reactions will be clear to them.5. They will know the applications of organometallic compounds in industries	
Content:	<p>1. Electronic structure of coordination compounds:</p> <p>1.1 Crystal field theory and its applications: a) Octahedral compounds; b) tetrahedral compounds; c) square-planar compounds and other geometries; d) tetragonally distorted compounds (Jahn-Teller Effect); e) octahedral vs tetrahedral</p> <p>1.2 Ligand field theory: a) σ bonding; b) π-bonding</p> <p>2. Magnetic Properties coordination compounds</p> <p>a) diamagnetism, b) paramagnetism; c) ferromagnetism, d) antiferromagnetism, d) temperature dependence magnetism; Curie law, Curie-Weiss Law.; e) spin cross over phenomenon</p> <p>3. Spectra of coordination compounds</p> <p>3.1 Electronic structure of atoms: a) spectroscopic terms; b) classification of microstates and energies of the terms; d) Racah parameters</p> <p>3.2 Electronic spectra: a) ligand field transitions; b) selection rules; c) spectroscopic terms of complexed ion; d) correlation and Orgel diagrams; d) Tanabe-Sugano diagrams; e) Charge-Transfer bands: LMCT transitions and MLCT transitions; f) Luminescence</p> <p>4. Inorganic reaction mechanisms:</p> <p>4.1 Substitution reactions in coordination compounds; b)</p>	<p>8 hr</p> <p>2 hr</p> <p>8 hr</p> <p>8 hr</p>

	<p>thermodynamic considerations; c) kinetic considerations; d) substitution reactions in octahedral compounds; e) substitution reactions in square planar compounds.</p> <p>4.2 Electron transfer reactions: inner sphere and outer sphere mechanism, Frank Condon principle, Marcus equation</p> <p>5. Organometallic compounds and reactions Significance of 18 electron rule, metal carbonyls & nitrosyls, reactions of organometallic compounds, metal centered catalysis in complex compounds, homogenous catalysis such as hydrogenation, hydroformulations, coupling reactions and isomerization of alkanes. Asymmetric catalysis, stereochemically rigid molecules.</p>	10 hr
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICC-502

Title of the Course: Materials Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICC-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of Materials Chemistry	No. of Hours
Course Objective:	To provide basic and advanced knowledge about solid state chemistry	
Course Outcome	This course will give sufficient information about the preparation of different types of materials, their structures, reactivity and properties.	
Content:	<p>1. Introduction to Materials chemistry</p> <p>2. Structure and bonding in solid materials: Crystal lattice; unit cell; Miller indices and planes; X-ray diffraction method; metallic, covalent and ionic solids; structural classification of binary and tertiary compounds.</p> <p>3. Non-stoichiometry in material solids: Oxygen deficient oxides, metal deficient oxides and classification of non-stoichiometry.</p> <p>4. Crystal defects: Types of defects: Point defects; Dislocations: Line defects and Plane defects</p> <p>5. Materials preparation techniques: I) Ceramic method II) Different wet chemical methods: A) For Powder materials: Co-precipitation, Precursor, Combustion, Sol-gel, Spray roasting, Freeze drying. B) For Single crystals: i) Growth from melt ii) Flux method iii) Epitaxial growth of single crystal thin films: Chemical and Physical methods iv) Chemical vapour transport v) Hydrothermal method vi) Dry high pressure method. C) For Amorphous Materials D) For Nanomaterials</p> <p>6. Reactivity of Solid Materials: Tarnish reactions, decomposition reaction, solid-solid reactions, addition reactions, double decompositions reaction, electron transfer reaction, solid-gas reactions, sintering, factors influencing reactivity of solids.</p> <p>7. Phase Transformations in Solid Materials: Thermodynamic consideration, structural change in phase transformation, Martensite transformation, temperature and pressure induced transformations, order- disorder transitions,</p>	<p>1 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p> <p>7 hr</p> <p>3 hr</p> <p>3 hr</p>

	<p>electronic transition, transformation with a change in composition.</p> <p>8. Electrical Properties: Electrical conductivity, free electron theory, fermi energy, insulators, semiconductor and conductors, band theory of semiconductor, Brillouin zones, Hall effect, the Seebeck effect, Superconductivity, BCS theory, Meissner effect, high temperature superconductor.</p> <p>9. Semiconductor Devices: Diodes, transistors and Junction field effect transistor, light meter, photodiode, phototransistor, solar cells, light emitting diodes, laser materials.</p> <p>10. Optical and dielectric properties: Luminescence and phosphorescence, piezoelectric, ferroelectric materials and applications.</p> <p>11. Magnetic properties: Introduction to magnetism, behaviour of substance in a magnetic field, magnetic moments, diamagnetism, paramagnetism, experimental determinations of susceptibility, ferromagnetism, anti-ferromagnetism and ferrimagnetism.</p>	<p>4 hr</p> <p>4 hr</p> <p>2 hr</p> <p>3 hr</p>
Pedagogy:	Lectures/ tutorials/ self-study or a combination of some of these.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICC-504

Title of the Course: Selected topics in inorganic chemistry - I

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with MSc-I Chemistry are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To gain knowledge in selected topics in inorganic chemistry.2. To learn s-block elements, selected compounds of d-block and f-block elements.3. To understand the basic electrochemical processes in inorganic compounds.4. To study the applications of inorganic compounds in selected areas.	
Course Outcomes:	<ol style="list-style-type: none">1. Students will be able to gain knowledge regarding chemistry (abundance, preparation, properties) of s, d and f block elements.2. Students will be able to gain knowledge of fundamentals of inorganic electrochemistry and medicinal chemistry.	
Content:	<p>1. S-block elements and their compounds</p> <p>1.1 Hydrogen and hydrides: Electronic structure, position in periodic table, abundance, preparation, properties, isotopes, ortho and para hydrogen. Classification of hydrides, preparation & properties of hydrides; hydrogen ion, hydrogen bonding and its influence on properties.</p> <p>1.3 Group 1 Elements: Introduction, abundance, extraction, physical and chemical properties, solubility and hydration, solutions of metal in liquid ammonia, complexes, crowns and cryptands, electrides, alkalides, difference between lithium and the other group 1 elements, diagonal relationship between Li and Mg.</p> <p>1.4 Group 2 Elements Introduction, abundance, extraction, physical and chemical properties, solutions of metal in liquid ammonia, complexes, anomalous behaviour of beryllium, difference between beryllium and the other group 2 elements, diagonal relationship between Be and Al, preparation and properties Grignard reagent.</p> <p>2. Chemistry of d-block and f-block compounds</p> <p>2.1 Polyoxometallates; 1.2 metal sulphides and sulfido compounds; 1.3 Nitrido & alkylidyne compounds; 1.4 Metal-metal bonded compounds and clusters; 1.5 coordination & organometallic compounds of lanthanides; 1.6 Electronic spectra of lanthanides & actinide compounds; 1.6 Brief chemistry of thorium, uranium, neptunium, plutonium &</p>	<p>10 hr</p> <p>6 hr</p>

	<p>americium.</p> <p>3. Fundamentals of Inorganic Electrochemistry Basic aspects of electrochemistry, electron transfer reactions at electrode surface, potential and electrochemical cells, voltammetric techniques, linear voltammetry, cyclic voltammetry; reversible, irreversible and quasi-reversible processes; applications of cyclic voltammetry with reference to ferrocenes, transition metal complexes.</p> <p>4. Inorganic medicinal chemistry Anticancer agents: Platinum and Ruthenium complexes as anticancer drugs, Cancer chemotherapy, phototherapy, radiotherapy using borane compounds, Chelation therapy, Gadolinium and technetium complexes as MRI contrast agents, X-ray contrast agents, Anti-arthritis drugs, Anti-bacterial agents (Ag, Hg, Zn and boron compounds), Antiseptic and anti-biotic, Deodorants and anti-perspirants, Anti-viral agents (influenza, herpes, hepatitis and HIV viruses), Li drugs.</p> <p>5. Nuclear Chemistry Radioactivity, Decay processes and decay energy, half-life of radioactive elements, Nuclear fission and fusion processes, Nuclear reactor components and functions, Q values for nuclear reactions, Nuclear waste management, Radiation detection principles, Chemical separation techniques of radioactive elements, Radio-analytical techniques, Activation analysis.</p>	<p>4 hr</p> <p>8 hr</p> <p>8 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II Inorganic Chemistry

Course Code: ICC-505

Title of the Course: Experiments in Inorganic Chemistry

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses ICC-401, ICC-402 and ICO-401 at M. Sc.-I level	No. of lectures
Course Objectives:	1. To introduce to practical knowledge in Inorganic Chemistry. 2. To learn techniques of crystallization of ligands and synthesis of coordination compounds 3. To learn characterization of compounds using different instruments 4. To provide experience of synthesis and characterization of materials 5. To introduce analysis of ores for metal content	
Course Outcomes:	1. Students will be in a position to understand general aspects involved in purification of ligands and synthesis of coordination of compounds 2. Students will be able to understand the methods for characterization of coordination compounds. 3. Students will be in a position to understand the solid state material synthesis and characterization. 4. Students will be able to separate metal ions by ion exchange chromatography. They will also gain knowledge about the analysis of ores and alloys	
Content:	<p>EXPERIMENTS IN INORGANIC CHEMISTRY <i>Total sixteen experiments to be performed from the following.</i></p> <p>Group – 1: Experiments in coordination chemistry: Ligand and complex synthesis, metal analysis (Minimum 3)</p> 1) Purification (distillation / recrystallization) of ligands like acacH, en, carboxylic acids etc) 2) Preparation of manganic tris(acetylacetonate) and estimation of manganese 3) Preparation of tris(thiourea) copper(I) sulfate and estimation of copper 4) Preparation of isomers; <i>cis</i> & <i>trans</i> dichloro-(ethylenediamine)-cobalt(III) chloride and estimation of cobalt 5) Preparation and resolution of tris(ethylenediamine)cobalt(III) ion and estimation of chloride 6) Preparation of <i>cis</i> and <i>trans</i> - potassium dioxalatodiaquo-chromate(III) and estimation of chromium 7) Preparation of nitro and nitrito-penta aminecobalt(III)chlorides and estimation of cobalt 8) IR spectral characterization of free ligands and coordinated ligands	18

	<p>9) Single crystal structure analysis <i>NOTE: In complex synthesis, the student is expected to recrystallize the product, record IR spectra and carry out metal analysis. Spectral analysis can be carried over.</i></p> <p>Group –2 Experiments in Solid State Chemistry (Minimum 3) 1) Preparation of spinel oxides by precursor method and estimation of metals in precursors and oxides, 2) Characterization of precursors by thermal analysis and infrared analysis 3) X-ray diffraction studies of oxides 4) Electrical characterization: i) Direct current electrical resistivity of semiconductor (Ge/Si) by Four Probe 4) Curie temperature determination of dielectric material (PZT) by measurement of dielectric constant v/s temperature 5) Measurement of magnetization parameter: M_s, M_r and H_c, 6) Determination of Curie temperature of magnetic oxides by A.C. susceptibility studies.</p> <p>Group – 3: Instrumental methods / spectral analysis / ion exchange (Minimum 3) A) Determination of stability constant of complex ions in solution 1) Fe(III) – thiocyanate compound B) Determination of instability constant of complex ions in solution 2) Determination of instability constant for the reaction between Ag^+ and NH_3 3) Determination of instability constant for the reaction between Ag^+ and en 4) Determination of instability constant for the reaction between Cu^{2+} and NH_3 5) Determination of instability constant for the reaction between Cu^{2+} and en C) Ion exchange chromatography 6) Separation of Mg^{2+} and Co^{2+}/Zn^{2+} by anion exchange column 7) Separation of transition metal cations by anion exchange column</p> <p>Group – 4: Ore / Alloy/ commercial sample analysis (Minimum 3) 1) Analysis of Goan Iron ore: Hematite / magnetite 2) Analysis of Devardas alloy 3) Analysis of Solder (Pb and Sn) 4) Analysis of Calcite/ Dolomite 5) Analysis of Pyrolusite 6) Analysis of Nickel-Aluminium alloy 7) Analysis of Brass / Bronze</p>	<p>18</p> <p>18</p> <p>18</p>
Pedagogy	Pre-labs, practical / self-study or a combination of some of these could also be used to some extent.

Programme: **M. Sc. Part-II (Inorganic Chemistry)**

Course Code: **ICO-501**

Title of the Course: Bioinorganic Chemistry

Number of Credits: **03**

Effective from AY: **2019-20**

Prerequisites for the course:	The students who have done MSc-I Chemistry core courses are eligible to attend	No. of lectures
Course Objectives:	1. To introduce, describe and highlight the role of inorganic elements especially metal ions in biology. 2. To describe the role of small molecular weight model compounds.	
Course Outcomes:	In addition to knowing the essential elements in biology the students will be able to understand the role played by metal ions in vital processes like i) oxygen storage and transport and ii) electron transfer.	
Course Content:	1. Essential elements in biology, distribution of elements in biosphere, bio-availability, bio-stability, building blocks of the biosphere; carbohydrates, nucleic acids and proteins, Biological importance of water, and brief review of the chemistry of biopolymers. Metallobiomolecules: classification of metallobiomolecules, metalloproteins (enzymes), metal activated proteins (enzymes), metal functions in metalloproteins, Principles of coordination chemistry related to bioinorganic research, physical methods in bioinorganic chemistry	6 hr
	2. Introduction, biological importance of the alkali and the alkaline earth cations, Cation transport through membranes (ion pumps). Photosynthesis, Hill reaction, Chlorin macrocycle and chlorophyll, Absorption of light by chlorophyll, role of metals in photosynthesis, in vitro photosynthesis.	6 hr
	3. Non redox metalloenzymes, zinc metalloenzymes like carboxypeptidase, carbonic anhydrase and alcohol dehydrogenase, Bio-functions of zinc enzymes, active site structure and model complexes.	6 hr
	4. Biochemistry of a few transition metals viz. Fe, Mo, Cu and Ni, Oxygen carriers and oxygen transport proteins, iron porphyrins (Haemoglobin and myoglobin). Haemocyanins and Haemerythrins, Synthetic models for oxygen binding haemproteins. cytochrome 'c', catalase peroxidase, and superoxide dismutase, blue copper proteins, vitamin B ₁₂ coenzymes, nitrogen fixation and iron-sulfur proteins, biological nitrogen fixation, nitrogenase and dinitrogen complexes, iron-sulfur proteins, synthetic analogues for Fe-S proteins, core extrusion reactions.	6 hr 6 hr

	<p>5. Metal transport and storage: A brief review of iron transport.</p> <p>6. Synthesis of simple ligands or isolation of S-containing amino acid or extraction of chlorophyll from green leaves (this will involve both collection of synthetic procedures from library, term paper presentation / discussion)</p>	
Pedagogy	Mainly lectures / tutorials / assignments /group discussion / self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. Part-II (Inorganic Chemistry)

Course Code: ICO-502

Title of the Course: Catalysis: The Basic chemical concepts

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	The students with Chemistry back ground are eligible for this course.	No. of lectures
Course Objectives:	<ol style="list-style-type: none">1. To understand fundamentals concepts of chemical reactions over the catalysts.2. To understand energy saving and making green processes in chemical reactions.3. To understand fundamentals concepts of chemical reactions for developing higher productivity, mechanisms and viability.4. To provide knowledge on applications of heterogeneous, homogenous and other catalytic processes.	
Course Outcomes:	<ol style="list-style-type: none">1. The students will be able to understand the green chemical processes.2. They will be well equipped with the knowledge of catalytic reactions.3. They will be in position to understand the reaction mechanism process.4. The concepts of catalytic reactions will be cleared to them.5. They will know the applications of catalyst compounds in chemical reactions and industries.	
Content:	<p>1. Origin and development of catalysis; Difference between heterogeneous, homogeneous, auto and photocatalysis, Importance of heterogeneous and homogeneous catalysts in chemical reactions.</p> <p>2. Heterogeneous Catalysis:</p> <ol style="list-style-type: none">i. Adsorptions: Physical and chemical adsorption, dissociative adsorptions, simple adsorptions isotherm, Langmuir adsorption and the BET adsorption isotherm.ii. Types of Catalysts; Preparations of the Catalysts, nano-materials, significance of zeolites and supported catalysts.iii. Characterization of solid catalysts: Surface area, structure and surface morphology, X-ray diffraction, SEM, TEM, X-ray absorption spectroscopy, XPS and Auger spectroscopy to surface studies.iv. Activity and life of the catalysts, active centers, promoters and poisons, catalyst deactivations.v. Heterogeneous reactions: Thermodynamic consideration in surface reactions, ammonia synthesis, oxidation reduction reactions (selected examples), mechanism of catalytic reactions, method of finding rate of the reactions and the rate determining steps.vi. Theories of Catalysis: Boundary layer theory, Catalysis by semiconductors, Wolkenstein theory, Balancing's approach,	<p>2 hr</p> <p>17 hr</p>

	<p>electronic factors is catalysis by metals.</p> <p>3. Homogeneous Catalysis: Intermediate stages in homogenous Catalysis, energy profile diagram, general scheme for calculating kinetics of reactions, decomposition of hydrogen peroxide, acid-base catalysis, hydrogenation, Mosanto acetic acid, Carboxylation reaction and Wacker reaction.</p> <p>4. Introduction to followings: Photocatalysis, catalytic polymerizations, phase transfer catalysis and biocatalysis with suitable examples.</p> <p>5. Catalysts for energy and environmental: Catalytic gasification, steam reforming, fuel cells and auto-industrial emission control.</p>	<p>7 hr</p> <p>6 hr</p> <p>4 hr</p>
Pedagogy	Mainly lectures / tutorials / assignments /self-study or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Inorganic Chemistry)

Course Code: ICO-503

Title of the Course: Chemistry of P-Block Elements

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the courses in Inorganic Chemistry at F Y B Sc, S Y B Sc, T Y B Sc and ICO-401 course at M.Sc. Part-I Chemistry so as to have basic knowledge of P-Block Elements	No. of Lectures
Course Objective:	To provide basic and advanced knowledge about P-Block elements, their compounds and complexes.	
Course Outcome	This course will give sufficient information about the periodic table in general and P-Block elements and their compounds in particular.	
Content:	1. General trends of different properties in groups and periods in periodic table	2 hr
	2. Chemistry of Group 13 Elements and their Compound 2.1 Introduction, physical properties, chemical reactions with oxygen, nitrogen, sulphur, halogens, HCl, NaOH, NH ₃ , mono-di-tri-chlorides, alums, organo-compounds of B and Al, difference between boron and other Gr. 13 elements, diagonal relationship. 2.2 Preparation, bonding and structure of diborane, higher boranes, borane anions, carboranes and metallocarboranes.	9 hr
	3. Chemistry of Group 14 Elements and their Compound 3.1 Introduction, physical properties, compound of Gr.14: Oxides, di & tetra halides, hydrides, sulphides, complexes of Gr. 14, organosilicon compounds (except silicones), cluster compounds of Ge, Sn and Pb. 3.2 Carbon dating, graphene, metallocarbohedrenes, freons.	5 hr
	4. Chemistry of Group 15 Elements and their Compound 4.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides; 4.2 Preparation, properties and structure of Phosphorous: Oxides, oxyacids, sulphides, oxosulphides; organophosphorous compounds. 4.3 Classification, preparation, properties and structures of phosphazenes.	5 hr
	5. Chemistry of Group 16 Elements and their Compound 5.1 Introduction, allotropes, physical properties, Preparation, properties and structure of: Hydrides, halides, oxohalides, oxides (except sulphur), oxyacids (except sulphur), classification of oxides. 5.2 Polyatomic sulphur cations, anionic polysulphides, compounds with sulphur as a ligand.	6 hr

	<p>6. Chemistry of Group 17 Elements and their Compound</p> <p>6.1 Introduction, physical properties; preparation, properties and structure of: Oxides, oxyacids, halides, oxohalides, hydrogenoxide fluorides and related compounds.</p> <p>6.2 Preparation, properties and structure of: Polyhalide anions, polyhalonium cations, halogen cations.</p> <p>7. Chemistry of Group 18 Elements and their Compound</p> <p>7.1 Introduction, physical properties; preparation, properties and structure of xenon compounds (fluorides and oxides); organoxenon compounds, coordination compounds.</p> <p>7.2 Preparation, properties and structure of compounds of other noble gases.</p>	<p>6 hr</p> <p>3 hr</p>
Pedagogy:	Mainly lectures/ tutorials/ assignments /seminars/ presentations/ self-study or a combination of some of these could be used to some extent. Sessions shall be fractionally interactive in nature.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-502

Title of the Course: Reaction Mechanisms, Stereochemistry and Asymmetric Synthesis

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry at T Y B Sc (Chemistry) and M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction to important principles of stereochemistry such as Baldwin's rules.2. Understand the importance of chirality in organic syntheses.3. Learn about non-catalytic asymmetric synthesis methods in the classical chemistry involving alkenes and carbonyl compounds.4. Analyse and understand mechanistic aspects for fundamental reactions studied at TYBSc/ MSc Part I levels.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in position to understand the importance of asymmetric synthesis in organic reactions.2. Students should be in position to understand to apply various principles of stereochemistry and understand the mechanistic aspects of fundamental reactions.	
<u>Content:</u>	<p>I. Reaction Mechanisms-</p> <p>1. Intramolecular Reactions (Baldwin's Rules)</p> <p>2. Molecular rearrangements and their synthetic applications</p> <p>2.1 Unifying principles and mechanisms of rearrangements taking place at an electron deficient and electron rich substrates.</p> <p>2.2 Rearrangements taking place at carbon: Arndt Eistert, Wagner Meerwein, benzil-benzilic acid, Pinacol, semipinacol, Tiffeneau Demjanov, dienone phenol, Wittig, Favorskii, Stevens, Wolff, Baker-Venkatraman rearrangement, Barton decarboxylation, Pummerer rearrangement.</p> <p>2.3 Rearrangements at nitrogen: Hofmann, Curtius, Lossen, Schmidt, Beckmann, Neber, Stieglitz rearrangement.</p> <p>2.4 Rearrangements at oxygen: Payne (including aza and thia Payne) rearrangement, hydroperoxide rearrangement, Criegee rearrangement.</p> <p>2.5 Aromatic rearrangements: Benzidine, Fries, Von Richter, Sommelet-Hauser, Smile's, Jacobsen. Rearrangement on aniline derivatives- Bamberger rearrangement, Fischer-Hepp, Orton, Hofmann-Martius,</p>	<p>02 hours</p> <p>07 hours</p>

	<p>Reilly-Hickinbottom, rearrangements of N-aryldiazanilines, Phenylhydrazines, Phenylhydrazones.</p> <p>2.6 Rearrangements involving fragmentations: Eschenmoser fragmentation.</p> <p>II Stereochemistry</p> <p>1.1 Stereoselectivity in cyclic compounds</p> <p>(1) Introduction</p> <p>(2) Stereochemical control in six membered rings</p> <p>(3) Reactions on small rings</p> <p>(4) Regiochemical control in cyclohexene epoxides</p> <p>(5) Stereoselectivity in bicyclic compounds</p> <p>1.2 Conformations, stability and reactivity of fused ring compounds</p> <p>1.2.1 Fused bicyclic systems with small and medium rings:</p> <p>(1) Bicyclo [4.4.0] decanes (cis- and trans-decalins)</p> <p>(2) cis- and trans- decalones and decalols</p> <p>(3) Octahydronaphthalins (octalins)</p> <p>(4) Bicyclo [4.3.0] nonane (cis- and trans-hydrindanes)</p> <p>1.3 Fused polycyclic systems</p> <p>(1) Perhydrophenanthrenes</p> <p>(2) Perhydroanthracenes</p> <p>(3) Perhydrocyclopentenophenanthrene system (steroids, triterpenoids and hormones). Conformations and reactivity towards esterification, hydrolysis, chromium trioxide oxidation, ionic additions (of X_2) to double bonds, formation and opening of epoxide ring, epoxidation by peroxy acids.</p> <p>1.4 Spirocyclic compounds</p> <p>1.5 Reactions with cyclic intermediates or cyclic transition states</p> <p>2. Conformation of bridged ring compounds</p> <p>2.1 Bicyclo [2.2.1] heptane (norbornane)</p> <p>(1) Geometry and topic relationship of hydrogens.</p> <p>(2) Solvolysis of bicyclo[2.2.1]heptyl systems, formation, stability and reactivity of norbornylcation.</p> <p>(3) Relative stability and the rate of formation of <i>endo</i> and <i>exo</i> isomers in both bornane and norbornane systems.</p> <p>2.2 Bicyclo [2.2.2] octane system</p> <p>(1) Geometry and topic relationship of hydrogens</p> <p>(2) Solvolysis of bicyclo[2.2.2]octyl system.</p> <p>2.3 Other bridged ring systems: starting from bicyclo[1.1.1]pentane to bicyclo[3.3.3] undecane</p> <p>2.4 Bicyclo system with heteroatom: the relative stabilities of</p>	<p>8 hours</p> <p>4 hours</p>
--	---	-------------------------------

	<p>tropine, pseudotropine and benzoyl derivatives of norpseudotropine.</p> <p>3. Dynamic Stereochemistry: Stereoselective Reactions</p> <p>3.1 Stereoselectivity: classification, terminology and principle. Selectivity in chemistry– substrate and product selectivity.</p> <p>3.2 Stereoselective reaction of cyclic compounds: Introduction, reactions of four, five and six-membered rings. Conformational control in the formation of six-membered ring.</p> <p>3.3 Diastereoselectivity: Introduction, making single diastereoisomers using stereospecific reactions of alkenes.</p> <p>3.4 1,2-Addition to carbonyl compounds: Predicting various addition outcomes using different predictive models such as, Cram Chelate, Cornforth, Felkin-Anh. Specific reactions: allylation/crotylation by Brown, Roush, BINOL catalyzed.</p> <p>3.5 Stereoselective reaction of acyclic alkenes: The Houk model</p> <p>4. Asymmetric synthesis</p> <p>4.1 Chiral pool (chiron approach)</p> <p>4.2 Chiral auxiliary approach Oxazolidinone & norephedrine-derived chiral auxiliary controlled Diels-Alder reaction and alkylation of chiral enolates and aldol reaction, Alkylation using SAMP and RAMP</p> <p>4.3 Chiral Reagents (Use of (-)-sparteine)</p> <p>4.4 Asymmetric catalysis CBS catalyst, Ruthenium catalyzed chiral reductions of ketones, Catalytic asymmetric hydrogenation of alkenes, Asymmetric epoxidation (Sharpless and Jacobson), Sharpless asymmetric dihydroxylation reaction Organocatalysed aldol reaction (Use of proline)</p> <p>5. Stereoisomerism due to axial chirality, planar chirality and helicity.</p> <p>5.1 Stereochemistry and configurational (R/S) nomenclature in appropriately substituted allenes, alkylidenecycloalkenes, spiranes, adamantoids, biaryls, trans-cycloalkenes, cyclophanes and ansa compounds.</p> <p>5.2 Atropisomerism in biphenyls and bridged biphenyls.</p>	<p>6 hours</p> <p>6 hours</p> <p>3 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-503

Title of the Course: Synthetic Methods in Organic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. Part-I (Chemistry) levels.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Study of various concepts related to making carbon-carbon bonds.2. To understand designing of organic synthesis to make molecules of interest.3. To plan total synthesis based on protection-deprotection strategy.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to understand how a carbon-carbon bond can be constructed.2. Students should be in a position to apply various reactions in constructions of simple to complex molecules.	
<u>Content:</u>	<p>1. Formation & reactions of enols and enolates.</p> <p>1.1. Keto-enol tautomerism: introduction, acidity, basicity concepts & pKa scale, neutral nitrogen and oxygen bases. Formation of enols by proton transfer, requirements for and mechanism of enolisation 51pprox.51d by acids & bases, types of enols & enolates, kinetically & thermodynamically stable enols, consequences of enolisation, stable enolate equivalents, preparation and reactions of enol ethers.</p> <p>1.2. Formation of Enolates: Introduction, preparation & properties, non-nucleophilic bases, E / Z geometry in enolate formation, kinetic vs. thermodynamic control, other methods for the generation of enolates, issue of enolate ambidoselectivity.</p> <p>1.3. Alkylation of enolates: diverse reactivity of carbonyl groups, alkylation involving nitriles and nitroalkanes, choice of electrophile for alkylation, lithium enolates of carbonyl compounds and alkylation, specific enol equivalents to alkylate aldehydes and ketones, alkylation of β-dicarbonyl compounds, problem of regioselectivity during ketone alkylation and the remedy provided by enones.</p> <p>1.4. Reaction of enolates with aldehydes and ketones: introduction, aldol reaction including cross & intramolecular version, enolizable substrates which are not electrophilic in nature, controlling aldol reactions with specific enol equivalents, specific enol equivalents for carboxylic acids, aldehydes and ketones.</p> <p>1.5. Acylation at carbon: Introduction, the Claisen ester condensation (intramolecular and inter / crossed),</p>	18 hours

	<p>acylation of enolates by esters, preparation of keto-esters by the Claisen reaction, directed C-acylation of enols and enolates & acylation of enamines.</p> <p>1.6. Conjugate addition of enolates: Introduction, thermodynamic control vs. conjugate addition, utility of various electrophilic alkenes in conjugate addition, formation of six-membered rings <i>via</i> conjugate addition and nitroalkanes as versatile synthons.</p> <p>1.7. Examples pertaining to the application of following condensation reactions in organic synthesis: Mukaiyama reaction, Perkin reaction, Dieckmann condensation, Knoevenagel condensation & Doebner modification, Stobbe condensation, Darzen's glycidic ester condensation, Michael addition, Robinson annulation, and the Sakurai reaction.</p>	
	<p>2. Synthetic utility of the following name reactions / methodology with specific examples:</p> <p>2.1 Mannich Reaction, Nef Reaction, Mitsunobu and Appel Reaction, Baylis Hillman reaction, Mc. Murry coupling, vicarious nucleophilic substitution, Steglich and Yamaguchi esterification, Ring closing and cross metathesis: Grubb's various generation, Grubbs-Hoveya, Schrock catalysts- Scope and challenges in terms of ring sizes as well as FG tolerance.</p>	6 hours
	<p>3. The Ylids in Organic Synthesis.</p> <p>3.1. Phosphorus Ylids: Nomenclature and Preparation. Wittig olefination: mechanism, stereoselectivity, cis- and trans-selective reactions, Wittig reagents derived from α-halo carbonyl compounds,</p> <p>3.2 Modified Wittig, Horner – Wadsworth – Emmons, Stille-Gennari modification with achiral and chiral substrates, Peterson reaction, Julia Olefination.</p> <p>3.3. Sulfur Ylids: sulfonium & sulfoxonium ylids in synthesis, diphenylcyclopropyl sulfonium ylids & their reactions with carbonyl compounds / Michael acceptors.</p>	6 hours
	<p>4. Protecting Groups in Organic Synthesis.</p> <p>4.1. Introduction, when are Protecting Groups needed? Effective use of protective groups. Umpolung of reactivity & protecting groups.</p> <p>4.2. Common protective groups namely acetals & ketals, ditho acetal/ketals, trialkylsilyl, TBDMS, THP, -OMPM, MOM, MTM, MEM, SEM & benzyl ether, methyl ether, benzyl amine, Cbz, t-Boc, Fmoc, t-butyl ester and methods for deprotection. Examples of multistep synthesis using</p>	6 hours

	protection-deprotection procedures.	
<u>Pedagogy:</u>	Lectures & tutorials. Seminars / assignments / presentations / self-study or a combination of some of these could also be used to some extent

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-504

Title of the Course: Pericyclic and Organic Photochemical Reactions.

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses/topics in Synthetic Organic Chemistry & organic spectroscopy at M Sc Part-I level.	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of various concepts in pericyclic chemistry based on molecular orbital theory.2. Introduction of analysis of pericyclic reactions using theoretical concepts.3. Learning mechanistic aspects of pericyclic & photochemical reactions in organic synthesis.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict course of given pericyclic reaction using the theoretical concepts.2. Students should be in a position to apply various to understand stereochemical output in a reaction.3. Students shall be in a position to understand/propose plausible mechanism of pericyclic/photochemical reactions.	
<u>Content:</u>	<p>1. Pericyclic Reactions Theory of pericyclic reactions- a) Frontier Molecular Orbital (FMO) theory b) Transition state aromaticity (Möbius-Hückel theory) concept c) Orbital correlation diagram method Analysis of pericyclic reactions (including stereochemistry) using the above concepts a) Cycloaddition reactions b) Electrocyclic reactions c) Sigmatropic rearrangements (Note: Various important features to be discussed taking examples of well-known reactions of each type) Some synthetically useful reactions (theory and examples) a) 1, 3-dipolar additions (Application of FMO theory and examples) b) [3, 3] Shifts; Claisen and Cope rearrangements and fluxional molecules, c) ene reaction, retro-Diels-Alder reactions.</p> <p>2. Organic Photochemistry a) Principles of energy transfer, theoretical concepts in organic photochemistry w. r. t.</p>	<p>24 hours</p> <p>12 hours</p>

	<p>cycloadditions, electrocyclic reactions etc.,</p> <p>b) Some photochemical reactions of alkenes, dienes, carbonyl compounds and arenes including the following- Cis-trans isomerization and photostationary equilibrium; Paterno-Buchi reaction ; Norrish Type cleavages; Di-pi methane rearrangement; bicycle rearrangement</p> <p>c) Reactions involving singlet and triplet oxygen</p>	
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCC-505

Title of the Course: Organic mixture separation and identification

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M. Sc. Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic separations.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Separation of organic components based on solubility. 2. Separation of organic components based on functionality. 3. Separation of organic components based on boiling points. 4. Distillation, recrystallization and derivatisation. 5. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.	
<u>Content:</u>	Three component mixture separation based upon differences in the physical and the chemical properties of the components. Elemental and functional group analysis and determination of physical constants of the individual compounds. Derivative preparation, its recrystallization and m. p. of each component and characterization of each component and its derivative by m. p. comparison. (Minimum 12 experiments of 6h each.) Assessment to be done through a 6hr examination comprising of an experiment emphasizing separation of mixture, elemental analysis of all three components and preparation of derivative of any one component suggested by examiner and recording of the physical constants and an oral assessment.	72 hours
<u>Pedagogy:</u>	Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-501

Title of the Course: Chemistry of Natural Products

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on stereochemistry, spectroscopy and synthetic organic chemistry at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	1. To study the main classes of natural products. 2. To understand the different methods that are used in natural product chemistry, including extraction, isolation and structural elucidation. 3. To understand the key biosynthetic pathways for the biosynthesis of terpenes, alkaloids and steroids.	
<u>Course Outcome</u>	3. Students should able to identify different types of natural products, their occurrence, structure biosynthesis and properties. 4. Students should able to carry out independent investigations of plant materials and natural products.	
<u>Content:</u>	1. General methods of purification and structure elucidation of Natural Products 1.1 General methods of isolation-The modern distillation process, maceration, enfleurage, extraction by cold pressing and extraction with solvents. 1.2 Fractionation of the crude extracts and purification of the individual compounds from the respective fractions using chemical and chromatographic techniques such as Column Chromatography, TLC, Preparative TLC, HPLC, etc. 1.3 Chemical methods based on the functional groups present. Bicarbonate extraction, sodium bisulphite adduct formation, derivatization, etc. 1.4 General approach to structure elucidation of the isolated pure compounds using UV, IR, NMR spectroscopy, MS spectrometry, optical polarimetry.	5 hours
	2. Structure elucidation by classical chemical methods 2.1 Terpenoids: α -cedrene 2.2 Alkaloids: Morphine, thebaine and codeine 2.3 Steroids: Cholesterol, bile acids	6 hours
	3. Structure elucidation by combination of chemical and spectral methods 3.1 Terpenoids: α - and β -vetivones, Ishwarone 3.2 Hormones: Cecropia Juvenile hormone, brevicomin and frontalinal 3.3 Oxygen heterocycles: Aflatoxin-B1, rotenone	8 hours

	4. Structure elucidation involving stereochemistry, spectral and Chemical methods 4.1 Terpenoids: Menthol and hardwickiic acid 4.2 Alkaloids: Reserpene	4 hours
	5. Synthesis of selected Natural Products, planning and execution 5.1 Terpenoids: Longifolene (E J Corey), Caryophyllene (E J Corey) Nootkatone (A Yoshikoshi), Menthol (Tagasago) 5.2 Alkaloids: Reserpine (R B Woodward), Morphine (Marshall Gates) 5.3 Hormones: Cecropia JH (Edward), Progesterone 5.4 Prostaglandins: Prostaglandin E ₂ (E J Corey) 5.5 Antibiotics: Cephalosporin (R B Woodward)	8 hours
	6. Biogenesis and biosynthesis of Natural Products 6.1 Terpenoids and Steroids: General approach towards biosynthesis of mono-, sesqui-, di-, tri-, tetraterpenoids and steroids through mevalonate pathway with special reference to the biosynthesis of terpenoids and steroids included in topics 3 to 6 6.2 Alkaloids: The shikimate pathway formation of hydroxybenzoic acid derivatives, aromatic amino acids, L-phenylalanine, L-tyrosine, phenolic oxidative coupling, biosynthesis of thebaine, codeine and morphine.	5 hours
<u>Pedagogy:</u>	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-503

Title of the Course: Introduction to Medicinal Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the topics on Reaction Mechanisms, stereochemistry and spectroscopy at M. Sc. part-I (Chemistry) levels.	
<u>Course Objective:</u>	4. Study of drugs and drug development. 5. Introduction to the concepts and processes of drug discovery, delivery, absorption and metabolism. 6. It also provides brief introduction to pharmacology, pharmacokinetics and pharmacodynamics.	
<u>Course Outcome</u>	1. Understand the historical and advanced concepts of medicinal chemistry and its advantages 2. Identify the medicinal properties of different organic molecules.	
<u>Content:</u>	1. Introduction to Drugs 1.1. Requirement of an ideal drug 1.2. Sources of drugs 1.3. Important terms used in chemistry of drugs 1.4. Classification and nomenclature of drugs	5 hours
	2. Drug Design 2.1. Analogues and pro-drugs 2.2. Concept of lead compounds 2.3. Features governing drug design – The method of variation, drug design through disjunction, conjunction, tailoring of drugs 2.4. Cimetidine – a rational approach to drug design.	5 hours
	3. Drug Development and drug action 3.1. Screening of natural products, isolation and purification, structure determination 3.2. Structure-activity relationship, QSAR, Synthetic analogues 3.3. Natural Products as leads for new pharmaceuticals 3.4. Receptor theories 3.5. Oxaminiquine – a case study. 3.6 Mechanism of drug action. 3.6. Introduction 3.7. Enzyme stimulation 3.8. Enzyme inhibition 3.9. Sulfonamides	8 hours
	4. Study of the following class of major drugs: 4.1. Pharmacodynamic Agents. a) Local anaesthetics b) Analgesics: Narcotic and non-steroidal anti-inflammatory,	8 hours

	<p>narcotic antagonists (Mechanism of Action and Synthesis of Ibuprofen)</p> <p>c) Antiepileptic drugs</p> <p>d) Antiparkinsonism drugs</p> <p>e) Antihistaminics (SAR and synthesis of chlorpheniramine) f) Sedatives and hypnotics (Mechanism of Action of and synthesis of Phenobarbital)</p> <p>g) Antipsychotics</p> <p>h) Cardiovascular agents: Cardiovascular diseases, Antianginal agents and vasodilators, Antihypertensive agents, Antiarrhythmic drugs, Adrenergic blocking agents (Mechanism of Action of Methyl Dopa and synthesis of Propranolol)</p> <p>i) Antihyperlipidemic and antiatherosclerotic agents</p> <p>j) Anticoagulants, blood coagulation and anticoagulant mechanism</p> <p>k) Diuretics</p> <p>l) Drugs and diabetes: Synthetic hypoglycemic agents.</p> <p>5.1 Chemotherapeutic Agents.</p> <p>a) Sulfonamides (Mechanism of Action of sulphonamides) b) Antitubercular and Antilepral agents (Mechanism of Action of p-Aminosalicylic acid and Dapsone) SAR of Dapsone</p> <p>c) Antiamoebics (Mechanism of Action of Metronidazole) d) Anthelmintics</p> <p>e) Antimalarials</p> <p>f) Antiviral agents</p> <p>g) Antineoplastic Agents</p> <p>Synthesis of Dapsone sulphacetamide Isoniazid Metronidazole</p> <p>5.2. Antibiotics : General information, mode of action and application of:</p> <p>a) β-Lactam antibiotics: Penicillins and Cephalosporins</p> <p>b) Aminoglycosides: Streptomycin, Neomycin</p> <p>c) Tetracyclines</p> <p>d) Macrolides: Erythromycin, Rifamycin</p> <p>e) Lincomycin</p> <p>f) Polypeptides: Bacitracin</p> <p>g) Unclassified antibiotic: Chloramphenicol (SAR and Synthesis)</p>	<p>4 hours</p> <p>6 hours</p>
Pedagogy:	Lectures/ tutorials/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-505

Title of the Course: Heterocyclic Chemistry

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the synthetic organic chemistry at M. Sc. part-I (Chemistry) levels, part II organic level CHOC-501, 502, 503 and 504 courses and must be simultaneously studying CHOO-503 and 504, courses.	
<u>Course Objective:</u>	1. Understand the fundamentals of heterocyclic chemistry 2. Knowledge of synthesis of heterocycles.	
<u>Course Outcome</u>	1. Understand the reactivity of heterocycles towards electrophilic, nucleophilic, reducing and oxidizing reagents. 2. Knowledge of synthesis of heterocycles.	
<u>Content:</u>	1. Introduction, classification and Nomenclature of mono- and bicyclic heteroaromatic molecules	04 hours
	2. Physical properties, dipole moment, acidity-basicity, Aromaticity electron density distribution and reactivity of- 2.1 Furan, Thiophene, Pyrrole, Indole 2.2 Pyridine, Pyridine-N-oxide 2.3 Quinoline and isoquinoline 2.4 Diazines and triazines 2.5. 1,3- and 1,2- azoles	20 hours
	3. Synthetic strategies based on retrosynthetic approach: General methods of synthesis of the following- 3.1 Furan, Thiophene, Pyrrole, Indole 3.2 Pyridine, Quinoline and isoquinoline 3.3 Chromones	12 hours
<u>Pedagogy:</u>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-506

Title of the Course: Introduction to Polymer Chemistry-I: Basic Concepts

Number of Credits: 03

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the courses in Organic Chemistry at T. Y. B Sc. and M. Sc. Part-I levels.	
<u>Course Objective:</u>	Introduction to various concepts in organic polymer chemistry.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the differences in structures and properties of small molecules and macromolecules.2. The students will be in a position to understand concepts involved in polymer synthesis and characterization.	
<u>Content:</u>	1. Brief history of natural and synthetic polymers: Classification & nomenclature of polymers, Functionality concept- linear, branched and cross-linked polymers. Introduction to biodegradable polymers.	07 hours
	2. Methods and Chemistry of polymerization: Bulk, solution, suspension, emulsion, addition, condensation polymerizations. Free-radical, Ionic and co-ordination polymerization reactions and copolymerization. Introduction to controlled free radical polymerization. Carothers equation in condensation polymerizations.	12 hours
	3. Some properties of polymers: Number and weight average molecular weights, Molecular weight distribution, polydispersity, Glassy state and glass transition temperature, crystallinity in polymers. Introduction to characterization of polymers.	10 hours
	4. Additives in polymers: Lubricants, plasticizers, stabilizers, antioxidant, fire retardants, blowing agents, fillers, colorants, crosslinking agents, UV-Vis degradants etc., (properties and examples)	07 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-507

Title of the Course: Introduction to Polymer Chemistry-II: Synthesis of Polymers and Processing

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the course entitled- Introduction to polymer Chemistry-I: Basic Concepts	
<u>Course Objective:</u>	Introduction to various concepts involved in the synthesis and processing of organic monomers and polymers.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. The students will be in a position to understand the synthetic methodology and applications of various monomers and polymers.2. The students will be in a position to understand concepts involved in polymer processing.	
<u>Content:</u>	<ol style="list-style-type: none">1. Resources for monomers, manufacture of some important monomers and reagents: Ethylene, propylene, butadiene, isoprene, styrene, divinyl benzene, acrylates, acrylonitrile, vinyl chloride, formaldehyde, adipic acid, urea, bisphenol-A, melamine, terephthalic acid, phthalic anhydride, dimethyl terephthalate, glycol, glycerol, ethylene oxide, epichlorohydrin, ϵ-caprolactum, di-isocyanates, pentaerythritol, allylic carbonate monomers.	14 hours
	<ol style="list-style-type: none">2. Synthesis, properties and applications of certain polymers: Vinyl polymers- LDPE, HDPE, PVC, PVA, polyvinyl acetate, polyacrylates, methacrylates, polystyrene, teflon, ABS, SBR, SAN. Condensation polymers- Nylons, polyesters, polyurethanes, polycarbonates. Thermoset polycarbonates like CR-39 Cellulose esters- cellulose acetate, nitrates and acetate-butyrates. Natural rubber, Thermoset resins- phenol-formaldehyde, resols and novolacs, melamineformaldehyde, urea-formaldehyde, epoxy resins - their curing.	14 hours
	<ol style="list-style-type: none">3. Polymer processing – Introduction to compounding, and processing techniques like calendaring, casting, moulding and spinning in polymer processing.	08 hours
<u>Pedagogy:</u>	lectures/ tutorials/ project work/ vocational training/viva/ seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. (Chemistry)

Course Code: OCO-508

Title of the Course: Selected Experiments in Organic Chemistry-I

Number of Credits: 4

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the relevant theory and practical courses in Organic Chemistry at M Sc Part-I levels.	
<u>Course Objective:</u>	To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.	
<u>Course Outcome</u>	Students shall gain the understanding of: 1. Stoichiometric requirements during organic syntheses. 2. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents. 3. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of microwave, photochemistry, low temperature synthesis etc. 4. Use of organic spectroscopic techniques in monitoring the organic syntheses.	
<u>Content:</u>	(Group A: minimum 8 experiments) 1. Dimedone from mesityl oxide (Dieckmann condensation). 2. 1,2,3,4-tetrahydrocarbazole from cyclohexanone (Fisher indolisation reaction). 3. o-Chlorobenzylidene rhodanine (Perkin reaction). 4. Diels- Alder reaction of anthracene and maleic anhydride using microwave irradiation. 5. Oxidation of a primary / secondary alcohol to carbonyl compound by polymer supported chromic acid (Amberlyst A - 26, chromate form). 6. Phenytoin from benzil and urea. 7. Use of protecting groups: Synthesis of 1,1-diphenylbut-1-en-3-one 1) Ethyl acetoacetate ethylene acetal. 2) 1,1-Diphenyl -1-hydroxy-3- butanone ethylene acetal. 3) 1,1-Diphenyl -1-hydroxy- 3-butanone. 4) 1,1-Diphenylbut-1-en- 3 -one. 8. Isoborneol from camphor (NaBH ₄ reduction) 9. 3 -Methyl -2-phenyl-2-butanol from 2-bromopropane and acetophenone 10. Friedel- Crafts acylation of anisole.	48 hours

	<p>11. Diethyl 4- butyl malonate by malonic ester condensation</p> <p>(GROUP B: minimum 8 experiments)</p> <ol style="list-style-type: none"> 1. Epoxidation of cholesterol or related compounds 2. 2,2 - dichloro bicyclo (4.1.0) heptane from cyclohexene and dichloro cabene using PTC. 3. Reduction of Nitrobenzene to aniline by Sn / HCl. 4. 2 - methyl benzimidazole from o-phenylene diamine. 5. Benzophenone oxime to benzanilide (Beckmann rearrangement). 6. Ferric chloride oxidative coupling of 2-naphthol: 2,2'- dihydroxy dinaphthyl 7. Dicoumarol from coumarin derivative. 8. LAH reduction of Anthranilic acid. 9. Norborneol to norcamphor using chromiurn trioxide/sulfuric acid 10. Halogenation using NBS: preparation of 9-bromoanthracene (or benzylic bromides) 11. Benzhydrol from benzaldehyde (Grignard reaction) 12. Ethyl n-butyl acetoacetate by acetoacetic ester condensation <p>Note: Students are expected to use techniques like TLC, IR, GC for monitoring/ establishing purity, identity of the synthesized compounds.</p>	48 hours
<u>Pedagogy:</u>	<p>Lectures/ pre-lab and post-lab exercises/ laboratory work /assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.</p> <p>The students are required to undertake pre-lab. and post – lab. assignment as instructed by the concerned teacher and the same may be evaluated by according suitable weightage as an ISA component while prescribing the mode of assessment.</p>

Programme: M. Sc. (Chemistry, Part-II)

Course Code: OCO-509

Title of the Course: Chemistry of Life

Number of Credits: 3

Effective from AY: 2019-20

<u>Prerequisites for the course:</u>	Should have studied the basic of amino acid, fatty acid and types of carbohydrates at BSc (Chemistry)	
<u>Course Objective:</u>	<ol style="list-style-type: none">1. Introduction of types of amino acid and proteins2. Introduction of carbohydrates and lipids3. Understanding characteristics of proteins, carbohydrates & lipids and their applicability in daily life4. Understanding chemicals used in food production through food processing, storage and cooking.5. Understanding food analysis and the chemistry of the digestion of food and the energy provided by food.	
<u>Course Outcome</u>	<ol style="list-style-type: none">1. Students should be in a position to predict type of proteins, lipids and carbohydrates available in food.2. Students should be in a position to apply knowledge role of cooking in daily food.3. Students shall be in a position explore the chemical structure and functionality for the macronutrient categories like carbohydrates, lipids, and protein in food4. Student will be able to design experiments through an inquiry-oriented, food chemistry focused laboratory program.5. The students should be able to identify the essential chemical components of food and have knowledge of their analyses, gained a working knowledge of the chemistry of lipids, carbohydrates and proteins	
<u>Content:</u>	<p>1. Chemistry and Functionality of Proteins Major food proteins Structure, physical function in food Analysis: Proteins</p> <ol style="list-style-type: none">a) Introduction of amino acid and role of polar, non-polar, acidic and basic side chains and also their properties, and Isoelectric pointb) Introduction of peptide, dipeptides and proteins.c) Types of proteins (primary (1°), secondary (2°), tertiary, (3°) and Quaternary (4°)<ul style="list-style-type: none">• Hydrogen bonding between side chains• Salt Bridges between side chains• Hydrophobic - non-polar interactions• Disulfide linkaged) Protein folding, denaturation, functional properties of proteins.e) Food Proteins – Source of Nutrients and Analysis of proteins and amino acidsf) Other Methods used in the Study of Food Proteins <p>2. Chemistry and Functionality of Major Components of Food: Carbohydrates</p> <p>Introduction of Mono, di and oligosaccharides, starch, Dietary fibre and gums, their reactions and physical function in food and their analysis.</p>	<p>12 hours</p> <p>12 hours</p>

	<ul style="list-style-type: none"> a) Content in common foods b) Discuss Fischer projections, Haworth Projections, stereoisomerism c) Major reactions d) Sugars: Hydrolysis, thermal degradation, Maillard reaction (non-enzymic browning reaction between reducing carbohydrates and proteins) e) Starch retrogradation (staling of bread) f) Mutarotation g) Decomposition of sugars: Maillard Reaction (Maillard Browning), Amadori Rearrangement and Analysis of Sugars h) Discuss Fischer projections, Haworth Projections, stereoisomerism <p>3. Chemistry of Major Components of Food: Lipids</p> <ul style="list-style-type: none"> a) <i>Fats: Fats in nutrition to be discussed</i> b) <i>Classes of lipids, fatty acids,</i> c) <i>monoglycerides,</i> d) <i>diglycerides,</i> e) <i>triglycerides, polar</i> f) <i>lipids</i> g) <i>Reaction of fats- Oxidative and hydrolytic rancidity</i> h) <i>Analysis</i> i) <i>Fats in food- for e.g. Chocolate</i> j) Other Methods Used in the study of food lipids to be discussed 	12 hours
<u>Pedagogy:</u>	lectures/ tutorials seminars/ term papers/assignments/ presentations/ self-study/ Case Studies etc. or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Thermodynamics and Reaction Kinetics

Course Code: PCC-502

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce to classical & non-equilibrium thermodynamics. To introduce advances in reaction kinetics.	
Course Outcomes:	Students should be in a position to understand various concepts of thermodynamics and kinetics. Students should be in a position to apply the knowledge of thermodynamics and kinetics for their lab course in physical chemistry, dissertation and research work.	
Content:	2. Equilibrium Thermodynamics 1.1 Thermodynamic state functions. Exact and inexact differentials; partial derivatives. Maxwell relations. 1.2 Thermodynamic equations of state. Temperature and pressure dependence of Gibbs function. Gibbs-Helmholtz equation. Partial molar quantities. Free energy change accompanying a chemical reaction, chemical potential, Gibbs-Duhem equation. Duhem-Margules equation. 1.3 Entropy of mixing for gases and liquids. Gibbs paradox. 1.4 Thermodynamic derivation of phase rule.	9 hours
	2. Non-equilibrium Thermodynamics 2.1 Concept of internal entropy and spontaneity of a process in relation to free energy. Chemical affinity and extent of a reaction. Mass and energy balance equations. Entropy production in heat flow, chemical reactions and open system. 2.2 Postulates and methodologies, linear laws, Gibbs equations, Onsager's reciprocal theory. Validity of Onsager's equation and its verification. Application to thermo-electric and electro-kinetic phenomena.	9 hours
	3. Reaction Kinetics 3.1 Collision theory of reaction rates and treatment of unimolecular reactions. Theory of absolute reaction rates and its applications to reactions in solution. Thermodynamic study from reaction kinetics, comparison of results with Eyring and Arrhenius Equations. Solvent and salt effects; influence of ionic strength and solvent on the rates of reaction, primary and secondary salt effects. 3.2 Mechanism of photochemical, chain, coupled and Reversible reactions. Oscillatory reactions. Chemical Hysteresis in Belousov-Zhabotinskii reaction. 3.3 Fast reactions and study by stopped flow technique, relaxation method, pulse radiolysis, flash photolysis and magnetic resonance methods. 3.4 Homogeneous catalysis and Michaelis-Menten kinetics. Kinetic	18 hours

	<p>rate law for autocatalytic reactions. Kinetics of heterogeneous reactions, heterogeneous catalysis, inhibition, product induced and non-reactive inhibition.</p> <p>3.5 Potential energy surfaces and introduction to molecular reaction dynamics, theoretical calculation of energy of activation, chemical lasers.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<ol style="list-style-type: none"> 1. P.W. Atkins & J. De. Paulo, <i>Atkins' Physical Chemistry</i>, Oxford Univ. Press, 2007, 8th Ed. 2. J. Rajaram, J.C. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Electrochemistry and Surface Studies

Course Code: PCC-503

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce electrochemical processes such as ion-ion and ion solvent interactions. To introduce thermodynamics of electrochemical processes, kinetics of electrochemical reactions, electrochemistry of fuel cells, batteries and super capacitors.	
Course Outcomes:	Students should be in a position to understand various concepts of electrochemistry. Students should be in a position to apply the knowledge of electrochemistry for their dissertation and research work. Students should be in a position to apply these concepts during the lab course in physical chemistry.	
Content:	3. Electrolyte Solutions 1.1 Ion-solvent interactions. Born Theory, validity and limitations. 1.2 Difference between solvation number and coordination number. 1.3 Ion-ion interactions and Debye-Huckel theory of ion cloud. 1.4 Concept of ionic strength and activity coefficient. 1.5 Debye-Huckel limiting law and its modifications. 1.6 Transport of ions in solution. Relaxation and Electrophoretic effects. 1.7 Debye-Huckel-Onsager equation, validity and limitations.	8 hours
	2. Electrified Interfaces 2.1 Formation of an electrified interface and its structure. 2.2 Polarizable and non-polarizable interfaces. 2.3 Concepts of outer potential, surface potential, inner potential and relationship between them, chemical and electrochemical potentials. 2.4 Concept of surface excess, Electro-capillary curves, Condition for thermodynamic equilibrium at electrified interface. 2.5 Generalized Gibbs equation, Lippmann equation and capacity of the double layer. 2.6 Models of the electrified interface. 2.7 Surface phase and Gibbs adsorption equation. Surface tension and adsorption on solid. Determination of surface excess.	8 hours
	3. Electrode Kinetics and Corrosion 3.1 Disturbance of electrode equilibrium, cause of electron transfer, fast and slow systems and their current-potential relationship. 3.2 Butler-Volmer equation and its low and high field approximations. 3.3 Nernst equation as a special case of B-V equation. 3.4 Tafel plots for anodic and cathodic processes. 3.5 Study of pH-potential diagrams.	8 hours

	<p>3.6 Pourbaix diagram for corrosion of iron.</p> <p>4. Colloids and Mircoemulsions.</p> <p>4.1 Charge and Stability of Sols. DLVO theory</p> <p>4.2 Electrokinetic phenomena: Electroosmosis, streaming potential and current, electrophoresis. Zeta potential.</p> <p>4.3 Donnan membrane equilibria.</p> <p>4.4 Micelles and reverse micelles: solubilisation, and bilayers.</p> <p>4.5 Microemulsions</p> <p>5. Electrochemical Energies</p> <p>5.1 Thermodynamics of electrochemical energy conversion.</p> <p>5.2 Batteries: basic principles; rating and shelf life. Zinc-manganese dioxide: Leclanche and alkaline batteries. Lithium ion batteries and recharge ability.</p> <p>5.3 Fuel cells: Principle of a hydrogen-oxygen fuel cell. Classification of fuel cell systems based on types of electrolytes/temperature. Direct methanol-polymer electrolyte fuel cell and electro-catalysts - a case study. Reactions occurring in various fuel cells and calculation of their electrode and cell potentials</p> <p>5.4 Super capacitors: Introduction: Origin of supercapacitance. Aqueous systems – ruthenium oxide/carbon with sulphuric acid and or solid polymer electrolytes.</p>	<p>6 hours</p> <p>6 hours</p>
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Group Theory and Spectroscopy

Course Code: PCC-504

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures
Course Objectives:	To introduce concepts in Group Theory and its applications to chemistry. To introduce some advanced topics in spectroscopy.	
Course Outcomes:	Students should be in a position to understand various concepts of Group Theory. Should be able to apply character table to solve various problems. Students should be in a position to apply the knowledge of spectroscopy for their dissertation and research work.	
Content:	<p>4. Elements of Group Theory</p> <p>1.1 Symmetry elements and symmetry operations, Concept of group and group multiplication tables, order of the group, classes and subgroups in a group, Different types of groups (cyclic, abelian and non-abelian groups).</p> <p>1.2 Point groups, Matrix representations of a group, Reducible and Irreducible representations groups, Great Orthogonality Theorem, Properties of Irreducible representations, Mulliken symbols for Irreducible representations, Character tables.</p> <p>1.3 Standard reduction formula, Direct products of representations and its applications Quantum Chemistry and spectroscopy: Vanishing of integrals, Selection rules. Applications of group theory for hybridization of atomic orbitals. Projection operator and Symmetry adapted linear combinations (SALCs), MO treatment (within Huckel Molecular Orbital Theory) of large molecules with symmetry. Applications of group theory to Infra-red and Raman spectroscopy.</p> <p>2. Microwave, IR and Raman Spectroscopy</p> <p>2.1 Theoretical treatment of Rotational and Vibrational spectroscopy.</p> <p>2.2 Principle of Fourier Transform (FT) spectroscopy, FTIR spectroscopy Theory, instrumentation and applications.</p> <p>2.3 Quantum theory of Raman effect, Raman shift, Instrumentation, Resonance Raman spectroscopy, Complementary nature of IR and Raman spectroscopy in structure determination, Applications.</p> <p>3. NMR Spectroscopy</p> <p>3.1 Basic principles of NMR.</p> <p>3.2 Theory of pulse NMR and Fourier analysis, FT-NMR.</p> <p>3.3 Solid state NMR, magic angle spinning (MAS), dipolar decoupling and cross polarization, applications of solid state NMR.</p> <p>3.4 Double resonance, NOE, Spin tickling, Solvent and shift reagents, Structure determination by NMR.</p> <p>4. ESR Spectroscopy</p>	<p>18 hours</p> <p>6 hours</p> <p>8 hours</p> <p>4 hours</p>

	<p>4.1 Theory and experimental techniques, Identification of odd-electron species (methyl and ethyl free radicals) and radicals containing hetero atoms.</p> <p>4.2 Spin trapping and isotopic substitution, Spin densities and McConnell relationship, Double resonance techniques.</p>	
Pedagogy:	Mainly lectures/ tutorials /assignments/ presentations/ self-study or a combination of these could also be used. Sessions shall be interactive in nature to enable peer group learning.

Programme: M. Sc. Part-II (Chemistry)

Course Code: PCO-503

Title of the Course: Solid State Chemistry II: Characterization of solid materials

Number of Credits: 03

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course Solid State Chemistry I : Concepts and Application, so as to have basic knowledge of solids state chemistry.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none">1. To introduce solid state characterization methods and techniques.2. To provide fundamental knowledge of principles and instrumentation involved in selected techniques.3. To provide comparative evaluation of data obtained from various techniques and its use in elucidating the chemical and morphological structure of solid materials	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to understand the design of the instrumental techniques, data acquisition and storage.2. Students should be able to understand the fundamental principles governing the technique, data interpretation and analysis to elucidate structural information of solid materials3. Students should be in a position to understand and apply the concept learned to make the best choice of a characterization technique(s) for elucidation of unknown solids under investigation.	
Content:	<p>1. Thermal Analysis</p> <p>1.1 Thermogravimetric analysis, Differential Thermal Analysis</p> <p>1.2 Differential scanning calorimetry</p> <p>1.3 Application to characterization of materials</p> <p>2. X – Ray Diffraction:</p> <p>2.1 The powder X-ray diffraction experiment, instrumentation</p> <p>2.2 Intensities: scattering of X-Rays and factors that affect intensities, powder x-ray pattern</p> <p>2.3 Introduction to single crystal x-ray diffraction.</p> <p>2.3 Applications of high temperature powder diffraction.</p> <p>2.4 Identification of crystal phases and evaluation of lattice characteristics</p> <p>3. Microscopic Techniques</p> <p>3.1 Introduction to Electron Microscopy: Generation of electron beam, elastic and inelastic scattering of electrons by atoms</p> <p>3.2 Scanning Electron Microscopy (SEM): Instrumentation, optics, resolution and compositional imaging, acquisition and data storage. Preparation of specimen, crystallographic information from SEM and environmental scanning electron microscopy</p>	<p>5 hours</p> <p>10 hours</p> <p>6 hours</p>

	<p>3.3 High Resolution Transmission Electron Microscopy (HR-TEM): Instrumentation, contrast mechanism, high voltage and scanning transmission microscopy, preparation of specimen and data interpretation.</p> <p>4. Selected Spectroscopic Techniques</p> <p>4.1 Vibrational spectroscopy: IR and Raman spectroscopy, fundamental principle, instrumentation and design, applications to ferroelectric materials such as LiNbO_3 and LiTaO_3.</p> <p>4.2 Visible and UV spectroscopy of solids: Fundamental principle, diffuse reflectance measurement, instrumentation and design, structural studies of transition metal oxides, glass and laser materials.</p> <p>4.3 X ray Spectroscopy: XRF, XANES and EXAFS: Absorption coefficient, absorption edges, resonance emission, extended absorption and photoelectron scattering. Instrumentation and design, characterization of transition metal oxides.</p> <p>4.4 Mössbauer Spectroscopy: Mössbauer effect, recoil free absorption and emission in solids, isomer shift, quadrupole splitting, magnetic splitting, instrumentation and design, characterization of Iron compounds.</p>	15 hours
Pedagogy:	Mainly lectures, tutorials, assignments and presentations or a combination of some of these could also be used to some extent.

Effective from AY: 2019-20

Prerequisites for the course:	Students should have studied the course PCC- 401, PCO- 401 in Semester I/II, so as to have basic knowledge of reaction kinetics.	No. of lectures/hours
Course Objectives:	<ol style="list-style-type: none"> 1. To introduce concepts of reaction kinetics and dynamics 2. To provide fundamental knowledge of theories that govern chemical reactions 3. To introduce newer classes of reaction types and their kinetics 4. To introduce latest developments in the advance instrumental techniques and methods for monitoring reaction kinetics and dynamics. 	
Course Outcomes:	<ol style="list-style-type: none"> 1. Students should be in a position to understand the concept of reaction kinetics and its significance. 2. Student will be able to differentiate between different reaction types, their kinetic analysis and its significance 3. Students should be able to apply these kinetic concepts to perform laboratory experiments in reaction kinetics. 3. Students should be in a position to apply these concepts of real life applications such as combustion engines, photochemical systems and atmospheric chemistry research. 	
Content:	<ol style="list-style-type: none"> 1.0 Theories of reaction rates <ol style="list-style-type: none"> 1.1 Generalized kinetic theory and extended collision theory. Concept of collisional number, collisional frequency factor, collisional and reactive cross section, steric factor, microscopic rate constant. Assumptions and limitations of collision theory 1.2 Conventional transition state theory, equilibrium hypothesis and derivation of reaction rates. Thermodynamic formulation of transition state theory. Arrhenius temperature dependent and independent activation energy and its significance. Assumptions and limitations of transition state theory. Introduction to extended transition state theory and microscopic reversibility. 1.3 Lindemann-Hinshelwood theory of thermal unimolecular reactions. Statistical energy dependent rate constant. Introduction to RRK and RRKM Theory and its applications. 2.0 Elementary reactions in solutions <ol style="list-style-type: none"> 2.1 Collisional kinetics in solution, effect of solvent polarity solvent cohesion energy, influence of ionic strength and ion-dipole and dipole-dipole reactions on reaction rates. Comparison of gas phase and solution reactions. 3.0 Homogeneous and surface reactions 	<p>8 hr</p> <p>3 hr</p> <p>8 hr</p>

	<p>3.1 Homogeneous kinetics, enzymatic reactions and Michaelis-Menten, Lineweaver-Burk and Eadie Analysis</p> <p>3.2 Autocatalytic and inhibition reactions. Product induced competitive and non-competitive inhibition reactions.</p> <p>3.3 Adsorptions: competitive, non-ideal and dissociative adsorptions</p> <p>3.4 Mechanism of surface reactions, kinetic effects of surface heterogeneity and interactions.</p> <p>3.5 Eley-Rideal, Langmuir Hinshelwood and Mars van Krevelen kinetic models of surface reactions</p> <p>4.0 Composite reactions</p> <p>4.1 Types of composite mechanisms, rate equation for composite mechanisms, simultaneous and consecutive reactions</p> <p>4.2 Decomposition reactions of ozone and acetaldehyde</p> <p>4.3 Gas phase combustion reactions, hydrogen – oxygen combustion, introduction to shock tube method and its use in combustion analysis.</p> <p>4.4 Polymerization kinetics, stepwise and chain polymerization.</p> <p>5.0 Fast Reactions</p> <p>5.1 Photochemical fast reactions: primary photochemical processes, reactions of electronically excited species and photochemical equivalence.</p> <p>5.2 Pulsed laser photolysis, multiphoton excitation processes and its use in monitoring fast reactions.</p> <p>5.3 Radiation-chemical reactions: radiation chemical primary processes, kinetic measurements in radiolysis method.</p> <p>5.4 Comparison of relaxation method and stopped flow technique.</p> <p>6.0 Reversible, Irreversible and Oscillatory reactions.</p> <p>6.1 Kinetics of reversible, irreversible reactions and graphical analysis</p> <p>6.2 Voltera-Lotka hypothesis of oscillatory reactions. The significance of bi-stability in the Briggs-Rauscher Reaction and Belousov-Zhabotinskii reaction.</p> <p>7 Reaction Dynamics</p> <p>7.1 Reactive collisions, chemiluminescence and laser induced fluorescence.</p> <p>7.2 Introduction to potential energy surfaces, internal coordinates and modes of vibration with suitable examples.</p> <p>7.3 Introduction to molecular reaction dynamics, investigation of reaction dynamics with ultrafast lasers.</p>	<p>4 hr</p> <p>5 hr</p> <p>4 hr</p> <p>4 hr</p>

Programme: M. Sc. Part-II (Chemistry)
Title of the Course: Colloids and Surface Science
Course Code: PCO-505
Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/ hours
Course Objectives:	To Introduce surface properties of materials and forces at different interfaces. To introduce the concept of micelles, microemulsions. To introduce different adsorption models.	
Course Outcomes:	Students should be in a position to understand surface phenomenon and properties of interfaces. Students should be in a position to understand electrochemical phenomenon at interfaces. Students should be in a position to apply these concepts during the lab course in physical chemistry	
Content:	<p>1. Liquid Surfaces and Interfaces</p> <p>1.1 General Introduction. Microscopic picture of liquid surface. 1.2 Surface tension and its measurement. Curved liquid surfaces. 1.3 The Kelvin equation and capillary condensation. 1.4 Nucleation Theory. 1.5 The surface excess. Gibbs energy and surface tension. The surface tension of pure liquids. Gibbs adsorption isotherm.</p> <p>2. Electrokinetic Phenomena and Surface Forces</p> <p>2.1 Electrocapillarity – theory and measurement. 2.2 Charged surfaces such as mercury, silver iodide and oxides. Measurement of surface charge densities. 2.3 Electrokinetic phenomena: concept of zeta potential. 2.4 Surface forces – Van der Waals forces between molecules. Surface energy and Hamaker constant. 2.5 Measurement of surface forces. The DLVO theory and beyond. 2.6 Contact angle and its measurements. The line tension. Wetting and wetting transitions.</p> <p>3. Solid Surfaces</p> <p>3.1 Surface stress and surface tension. Determination of surface energy. Surface steps and defects 3.2 Solid – solid interfaces 3.3 Microscopy of Solid surfaces: Optical microscopy, Electron Microscopies, Scanning Probe Microscopy (STM, AFM). 3.4 Diffraction Methods.</p> <p>4. Adsorption</p> <p>4.1 Types of adsorption and adsorption times. Classification of adsorption isotherms. 4.2 Thermodynamics of adsorption.</p>	<p>7 hr</p> <p>9 hr</p> <p>6 hr</p> <p>6 hr</p>

	<p>4.3 Adsorption Models. The potential theory of Polanyi. 4.4 Experimental aspects of adsorption from gas phase. 4.5 Adsorption on porous solids. 4.6 Adsorption from solution.</p> <p>5. Surfactants, Micelles, Emulsions and Thin films 5.1 Classification of surfactants. 5.2 Spherical micelles: cmc and influence of temperature. Thermodynamics of micellization. Structure of surfactant aggregates 5.3 Macroemulsions: properties, formation and stabilization. Evolution and aging. Coalescence and demulsification. 5.4 Microemulsions: size of droplets. Elastic properties of surfactant films. Factors influencing the structure of microemulsions.</p>	8 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.	
Text Books/ Reference Books	<p>Text Book</p> <ol style="list-style-type: none"> 1. H J Butt, K. Graf and M. Kappl, Physics and Chemistry of Interfaces, Wiley-VCH, 2006. 2. A.W. Adamson and A.P. Programme: M. Sc. Part-II (Chemistry)

Title of the Course: Nanoscience: Concepts and Applications

Course Code: PCO-506

Number of Credits:03

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the courses PCC-401, PCC-402 and PCO-401. Should have basic knowledge of Physical Chemistry.	No. of lectures/hours
Course Objectives:	1. Introduction of various concepts for nanoscience. 2. Introduction of various synthesis methods of nanomaterials. 3. Introduction of various characterisation techniques and application study of nanomaterials	
Course Outcomes:	Students will learn different techniques of synthesis and characterisation of nanomaterials. Students should be in a position to understand magnetic, electrical, optical and catalytic properties of materials at nanoscale level. Students should be in a position to apply the knowledge of subject for their dissertation and research work.	
Content:	1. Essential concepts and definitions Nanoscale, interdisciplinary nature of nanoscience, quantum effects, colours from colloidal gold, Surface to volume ratio of nanoparticles, surface effects and surface energy on nanoparticle surface. 2. Electronic and Electrical properties Chemistry of solid surfaces, Zero dimensional systems: nanoparticles One dimensional systems: nanowires and nanorods Metallic nanowires and quantum conductance. 3. Fabrication of nanoscale materials: top-down vs bottom-up approach i. Physical nanofabrication methods for the two dimensional nanostructures such as Thin film deposition of metallic copper, aluminium, tungsten and semiconducting silicon and Gallium arsenide films; Epitaxial growth; chemical vapour deposition and molecular beam epitaxial methods for the synthesis of semiconducting thin films, ii. Plasma Lithographic, photolithography, e-beam lithographic techniques for the transfer of circuit and nanopatterns on thin films. Positive and negative photoresists, different etching methods for the final pattern transfer on thin films. iii. Synthesis of colloidal metallic nanoparticles using different stabilizing and complexing agents such as citric acid and use of surfactants. iv. Discussion of Self assembly growth modes for thin films and colloidal nanoparticles : Stransky-Krastinova and Ostwald ripening	5 hr 5 hr 8 hr

	<p>4. Investigation of important nanomaterials:</p> <p>Silica: discussion of sol-gel and liquid crystal synthesis method, self assembly of colloidal silica particles, photoluminescence property of opals, different surface functionalization methods and application study</p> <p>Gold: Different colloidal synthesis methods, self assembly methods, surface Plasmon resonance (SPR) of colloidal gold nanoparticles surface functionalization strategies and application study</p> <p>CdSe: Different synthesis methods, synthesis of coreshell particles, Study of CdSe excitons and CdSe quantum dots, functionalization and application study.</p> <p>Iron oxide, Different synthesis methods Superparamagnetism property of nanoparticles, Hysteresis and magnetisation of Fe₃O₄ nanomaterial, catalytic and Biomedical applications.</p> <p>Carbon: synthesis methods for carbon nanotubes, Graphene and Buckminster fullerene, structural study of these materials, electrical property study of these materials, surface functionalization strategies and application study</p>	10 hr
	<p>5. Characterisation of nanomaterials</p> <p>i. Beam probe methods: Instrumentation, physical principle and different modes of operations in electron microscopic techniques such as Transmission electron microscope Scanning electron microscope and <i>Energy-dispersive X-ray spectroscopy</i>.</p> <p>ii. Electron and Scanning probe methods: Instrumentation, physical principle and different modes of operations in scanning tunnelling microscopy (STM) and Atomic force microscopy.</p> <p>iii. Optical Microscopes: Instrumentation, physical principle and different modes of operations in <i>Stimulated emission depletion (STED) microscopy</i> STED, Single molecule microscopy and <i>Dynamic light scattering (DLS)</i> is a technique.</p>	4 hr
	<p>6. Applications of nanomaterials</p> <p>Polymer vesicles for drug delivery, interaction of nanoparticles with DNA, Biosensors, Heterogeneous catalysts for the synthesis of fine chemicals, use of nano TiO₂ and ZnO for water and air pollution control.</p>	4 hr
Pedagogy:	Mainly lectures / tutorials. Seminars/assignments/ presentations/ self-study or a combination of some of these could also be used to some extent. Sessions shall be interactive in nature to enable peer group learning.

M Sc-II Pharmaceutical Chemistry
Semester III and IV Courses (Academic year 2019-2020 onwards)

Compulsory courses			Optional courses		
Code	Title	Credits	Code	Title	Credits
HCC-501	Pharmaceutical Chemistry II	3	HCO-501	Pharmacological and Toxicological Screening Techniques	3
HCC-502	Drug Product Formulation And Development	3	HCO-502	Calibration and Validation	3
HCC-503	Drug Design And Development	3	HCO-503	Polymers in Pharmaceuticals and novel drug delivery systems	3
HCC-504	Drug Quality And Regulatory Affairs	3	HCO-504	Biopharmaceutics	3
HCC-505	Laboratory Course In Pharmaceutical Chemistry	3	HCO-505	Pharmaceutical Technology	3
			HCO-506	Pharmaceutical Stability	3
			HCO-507	Laboratory Course in Natural Product Analysis	3
			HCO-508	Laboratory Course in Drug Product Formulation and Development	4
			HCO-509	Laboratory Course in Drug Design, Molecular Docking and Patents	2
			HCO-510	Laboratory Course in Quality Control and Quality Assurance	4

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-501

Title of the Course: Pharmaceutical Chemistry II

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the course in Pharmaceutical Chemistry at T Y B Sc level.	
<u>Course Objective:</u>	To learn major classes of drugs and understand its SAR and Mechanism of action.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to identify the examples in different classes of drugs• Students should be able to write IUPAC names and Structure of drugs.• Students shall be in a position to understand the mechanism of action of selected classes of drugs.• The students will have a clear understanding of concepts on SAR analysis.• The students will be able to apply synthetic organic chemistry knowledge in devising a synthesis for a drug.	
<u>Content:</u>	<p>1. Cholinergic and Adrenergic Agents, General Anaesthetics and Hypotensive agents Drugs acting on cholinergic nervous system: Bethanechol, Methacholine\$, Neostigmine, Pyridostigmine, Parathion, Malathion, Atropine, Dicyclomine\$, Tropicamide\$, Papaverine, Drugs acting on adrenergic nervous system: Methyldopa (MA,\$), Guanethidine, Ephedrine, amphetamine, Tranylcypromine, Pragyline, Norepinephrine, Epinephrine, Pronetalol, Propanalol\$, Atenolol\$, Metoprolol. General Anaesthetics: Ether, Nitrous oxide, Halothane\$, Ultra short acting Barbiturates-Thiopental sodium \$. Hypotensive agents acting on vascular smooth muscles: Nitrites, Amyl nitrites, Glyceryl nitrite\$, Pentaerythritol tetranitrate, Isosorbide dinitrate.</p> <p>2. Drugs acting on the central nervous system: Hypnotics and sedatives: Chloral hydrate, Phenobarbital\$, Secobarbital, Thiopental\$, Nitrazepam, Drugs acting as anticonvulsants: Phenytoin\$, phenacemide, Clonazepam, Phensuximide, Phenobarbital, (Classification of Barbiturates), Primidone, Carbamazepine\$. Psychotherapeutic agents: Phenothiazines such as Chlorpromazine, Chlorodiazepoxide\$, Oxazepam, Diazepam, Imipramine, Nialamide, Tranylcypromine, Pargyline. CNS stimulants: Phenmetrazine, Nikethamide\$, Iproniazid, PicROTOXINES, Tetrazole, Amphetamine.</p> <p>3. Antihistaminics, antiemetic, antiulcer drugs, Drugs used parkinsonism and Alzhemeier's Diphenhydramine, Triprolidine, Cyclizine, Promethazine\$, Cimetidine, Omeprazole (MA),Ranitidine, Sumatriptan, Ondisiton.</p>	<p>10 hours</p> <p>10 hours</p> <p>05 hours</p>

	<p>Drugs used in Parkinsonism: Benztropine mesylate, Levodopa, Carbidopa, Amantadine hydrochloride. Drugs for Alzheimer's diseases: Serin, Velnacrine, Aniracetam.</p> <p>4. Cardiovascular drugs, antihypertensive agents, and antibiotics: Digitoxin, Quinidine, Procainamide, Verapamil. Antihypertensive agents which elicit their action through autonomous nervous system previously described under 1 and 2, clonidine, hydralazine, ACE inhibitors- Enalapril and related drugs vasodilators such as Nitroglycerine, Isosuprine, Nylidrin, Antibiotics: Penicillin and semisynthetic penicillins and Cephalosporins, Amoxicillin, Cloxacillin, Streptomycin, Chloromphenicol, Tetracycline and derivatives, Erythromycin.</p> <p>5. Analgesics, Antipyretics and Inflammatory agents: Analgesics, antipyretics and anti-inflammatory agents: Aspirin\$, Sodium salicylate, Acetaminophen\$, Phenacetin, Phenylbutazone, Oxyphenbutazone, Ibuprofen\$, Naproxen\$, Probenacid, Allopurinol, Profen, Diclofenac \$. Narcotic analgesic agents: Morphine, Codeine, Levarphanol, Meperidine, Methadone, Dextropropoxyphene. Non-narcotic analgesic agents: Dextropropoxyphene morphine antagonist n-allyl-nor morphine, Levallorphan.</p> <p>Note: \$- Synthesis to be studied.</p>	<p>05 hours</p> <p>06 hours</p>
<u>Pedagogy:</u>	Mainly Lectures & tutorials. Seminars/ assignments/ presentations/ self-study/group discussion or a combination of some of these could also be used to some extent.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-502

Title of the Course: Drug Product Formulation and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on drug formulations	
<u>Course Objective:</u>	To understand the concept of drug dosage forms types of formulations and pilot plant process. To study the drug formulation development with specific examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">Students should be able to formulate drugsStudents should be able to apply this knowledge for formulation experiments in laboratory.	
<u>Content:</u>	1. Introduction and Classification: Introduction to drugs, Dosage Forms & Drug Delivery system – Definitions of Common terms. Drug Regulation and control, pharmacopoeias-formularies, sources of drug, drug nomenclature, routes of administration of drugs products, need for a dosage form, classification of dosage forms & brief description, study of excipients.	08 hours
	2. Drug Product Development Preformulation studies, objectives, factors to be considered, study protocol. Brief discussion on various parameters to be investigated. formulation and development of the dosage form/drug delivery system-general consideration.	08 hours
	3. Pilot plant Scale up techniques, Benefits of pilot plant- Broad guidelines of process development. General Consideration. Industrial manufacturing method and flow charts of sulphamethoxazole, Rifampicin, Chloramphenicol maleate.	08 hours
	4. Pharmaceutical manufacturing operations Brief discussion on unit operations and types of equipments/ machines used. Unit operations like size reduction, mixing/blending, drying, compression etc.	06 hours
	5. Dosage forms-formulation components, manufacturing and QC Liquids-monophase & biophase including ENT preparation. Semisolid e.g. Ointment, creams, gels etc. Solid dosage forms, e.g. Tablets, capsules, granules & powders. Sterile dosage forms, e.g. Injectables and ophthalmic preparations.	06 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-503

Title of the Course: Drug Design and Development

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of the concept of drug design and the need for it.	
<u>Course Objective:</u>	To make the students well versed with theories of drug action. To make the students understand the Structure Activity Relationship studies with respect to various examples.	
<u>Course Outcome</u>	<ul style="list-style-type: none">• Students should be able to explain the theories of drug action.• Students should be able to apply Quantitative Structure Activity Relationship knowledge in drug designing• Students should be able to analyze the effect of different functional groups on the biological activity of drugs• The students will have a clear understanding of concepts on SAR analysis.• The students should be able to illustrate an example of drug designing by molecular modeling.• The students will be able to understand the terms in patents.	
<u>Content:</u>	1. Introduction to Drug design, Lead compounds and Pro-Drug Concept. Development of new drugs: Introduction, procedure followed in drug design, the search for lead compounds, molecular modification of lead compounds, prodrugs and soft drugs, prodrug; introduction, prodrug formation of compounds containing various chemical groups, multiple prodrug formation, soft drugs; design of soft drugs.	08 hours
	2. SAR and QSAR Studies in drug discovery Structure-Activity Relationship (SAR): Factors effecting bioactivity, resonance, inductive effect, isoterism, bioisosterism, spatial considerations, biological properties of simple functional groups. 4-5 illustrative examples depicting structural activity relationship studies. Theories of drug activity, occupancy theory, rate theory, induced-fit theory. Quantitative structure-activity relationship (QSAR): history and development of QSAR, drug receptor interactions, the additivity of group contributions, physico-chemical parameters, lipophilicity parameters, electronic parameter, ionization constants, steric parameters, chelation parameters, redox potential, indicator-variables, quantitative models.	08 hours
	3. QSAR Approaches in drug designing and modern methods in discovery Hansch analysis- Advantages and drawbacks. Free-Wilson	08 hours

	<p>analysis, Advantages and drawbacks. Their application, relationship between Hansch and Free-Wilson analysis (the mixed approach), non-linear relationship, Introduction to other QSAR approaches- Free Topliss Method-Postulates and Illustration. Introduction to molecular modeling using computers and docking, uses of molecular modeling manual use, further computer programming.</p> <p>4. Designing of Enzyme Inhibitors Structure-based drug design: Process of structure based drug design, deactivation of certain drugs necessary for T cell functioning, determination of the active site with special reference to chymotrypsin, design of inhibitors. Design of Enzyme Inhibitors, 9-alkylpurines, 9-mercaptopurines and allopurines, active site directed irreversible enzyme inhibition, suicide enzyme inactivators.</p> <p>5. Development of New drugs High throughput screening. Drug Design softwares and its applications. Intellectual property rights, patents, industrial designs, geographical indications, trademarks, trade secrets. Patentable inventions. Patentable drugs. Role of patents in Pharmaceutical industry. trade related aspects (TRIPS), international & regional agreements. Examples of new drugs developed.</p>	<p>06 hours</p> <p>06 hours</p>
Pedagogy:	Lectures assignments presentations and case studies will be acquired methods for learning.

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have the knowledge of drug quality management at TYBSc. Level	
<u>Course Objective:</u>	<p>To learn quality management concepts in pharmaceutical industries.</p> <p>To understand the roles of quality control and quality assurance in pharmaceutical industries.</p> <p>To understand quality control processes essential in pharmaceutical industries.</p> <p>To study the fundamentals of regulatory affairs.</p> <p>To learn the ICH guidelines for drug product efficacy and safety.</p>	
<u>Course Outcome</u>	<p>A student will be able to explain the role and responsibilities of quality management.</p> <p>A student will be able to analyze various quality control documentation procedures.</p> <p>Student will be able to apply the knowledge of regulatory affairs in understanding company rules and regulations.</p> <p>A student will be able to relate ICH guidelines to drug product efficacy and safety.</p>	
<u>Content:</u>	<p>1. Quality Management I</p> <p>Concept of Total quality management, Philosophy of c-GMP & GLPs. Organization and Personnel, Responsibilities, training, hygiene, personal records. Premises: Location, Design, Plant layout, construction, maintenance, sanitation, environmental control, utilities & services like gas, water, electricity, Maintains of sterile areas, control of contamination. Equipment; selection, purchase specifications Raw material; purchase specifications, stores, selection of vendors, controls on raw materials, Manufacture of and controls on dosage forms, documents, Master formula batch formula records, standard operating procedure, quality audits of manufacturing processes and facilities. In process quality controls on various dosage forms sterile & non sterile standard operating procedures for various operations like cleaning, filling, drying compression, coating polishing, sterilization Quality control laboratories responsibilities good laboratory practices. Data generation and storage. Quality control documentation, retention of sample records, audits of quality control facilities.</p> <p>2. Quality Management II</p> <p>Finished products release, Quality reviews, Quality audits, batch release documents Ware housing, good ware housing practices, Materials & Management. Distribution & selection of records, Handling of returned good, recovered materials & reprocessing.</p>	<p>08 hours</p> <p>08 hours</p>

	<p>Complaints & recalls, evaluation of complaints, recall procedures & selected record, documents, waste disposal, scrap disposal procedures & records. Pharmaceutical process validations. Quality Management of cosmetics i) Preparations for facial skin: - Vanishing cream, cold & moisturizing cream, face powder ii) Preparations for Oral hygiene: - Dentifrices, mouthwashes iii) Preparations for hair: - Shampoos, Hair dyes, & Conditioners.iv) Body cosmetics: - Antiperspirants & deodorants, talcum Powder</p> <p>3. Validation Procedures Qualification, Validation and calibration of equipment. Validation of process like mixing, granulation, drying, compression. Filtration filling etc. Validation of sterilization methods and equipment, Dry heat sterilization, Autoclaving, membrane filtration. Validation and audits of analytical procedures, Validation and personnel. Validation and security measures for electronic data processing.</p> <p>4. Fundamentals of Regulatory affairs International Conference On Harmonisation: Technical Requirements for Registration of Pharmaceuticals for Human Use: History, structure and process for harmonisation. ICH guidelines on quality: Stability Testing of New Drug Substances and Products Stability Testing: Photostability Testing of New Drug Substances and Products, Stability Testing for New Dosage Forms, Bracketing and Matrixing Designs for Stability Testing of New Drug Substances and Products, Evaluation of Stability Data, Impurities in New Drug Substances, Impurities in New Drug Products, Impurities: Guideline for Residual Solvents.</p> <p>5. Product efficacy and safety ICH guidelines on efficacy: ICH guidelines on clinical trial and Good Clinical Practice. ICH Guidelines on safety: Carcinogenicity Studies - Need for Carcinogenicity Studies of Pharmaceuticals and Testing for Carcinogenicity of Pharmaceuticals. Genotoxicity: A Standard Battery for Genotoxicity Testing of Pharmaceuticals. Detection of Toxicity to Reproduction for Medicinal Products & Toxicity to Male Fertility. Preclinical Safety Evaluation of Biotechnology-Derived Pharmaceuticals.</p>	<p>08 hours</p> <p>06 hours</p> <p>06 hours</p>
<u>Pedagogy:</u>	Lectures, assignments, presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCC-505

Title of the Course: Laboratory Course in Pharmaceutical Chemistry

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have undergone practical course in pharmaceutical chemistry at TYBSc. Level.	
<u>Course Objective:</u>	To apply the theoretical knowledge of pharmaceutical chemistry for synthesis.	
<u>Course Outcome</u>	A Student should be able to apply synthetic organic chemistry knowledge for synthesis of drug like compounds.	
<u>Content:</u>	1. Methods for synthesis of pharmaceutical compounds. a) Acetylation of p-aminophenol to acetanilide b) Esterification of salicylic acid c) Benzoylation of alanine/L-Cysteine d) Diazotisation of m-nitroaniline and coupling to give azo dye e) Schiff bases from 2-aminophenol and p-bromobenzaldehyde f) Sulphonylation of aniline/phenol	16 hours
	2. Synthesis of bioactive heterocycles a) 2-Methyl Benzimidazole from o-phenylene diamine b) 2,3-DiphenylQuinoxaline from Benzil c) Dilantin from Benzil and urea d) 7-Hydroxycoumarin from ethylacetoacetate e) Barbiturate from diethyl-n-butylmalonate f) Flavone from 2-hydroxyacetophenone g) Benzoxazole from 2-aminophenol h) Synthesis of Phenothiazine derivative	36 hours
	3. Synthesis of medicinal compounds a) Synthesis of Propranolol from α -Naphthol b) Synthesis of Sorbic acid from crotonaldehyde c) Synthesis of Dichloramine-T and Chloramine-T d) Synthesis of Eosin from Fluorescein e) Synthesis of Gramine from Indole	20 hours

<u>Pedagogy:</u>	Laboratory work well understood by pre-lab and post-lab assignments.	
<u>References/Readings</u>	<ol style="list-style-type: none"> 1. K.A. Connors, <i>Text book of Pharmaceutical analysis</i>, Wiley Interscience Publication 1990, 3rd Ed. 2. J. Bassett, J. Mendhan, R.C. Denny, <i>Vogel's Text Book of Quantitative Chemical Analysis</i> revised by G.H. Jeffery, Pearson Education Publication, 2007, 6th Ed. 3. Kar, <i>Advanced Practical Medicinal Chemistry</i>, New Age International Limited Publishers, 2004 	

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-501

Title of the Course: Pharmacological and Toxicological Screening Techniques

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of Biological Chemistry	
<u>Course Objective:</u>	To learn screening methods of biological Assay. To learn terms involved in Toxicology. To learn methods of analysis for Toxicology.	
<u>Course Outcome</u>	A student will be able to apply the role of various screening methods in bioassay. A student will be able to create various in vivo and in vitro assay methods for various targets. A student will be able to evaluate various effects of toxicology.	
<u>Content:</u>	1. Principles of Biological Standardisation, Screening methods Statistical treatment of model problems in evaluation of drugs-methods of biological assay, principles of biological assays-methods used in bioassay of vitamins, hormones, vaccines, cardiac drugs and other pharmacopoeial preparations. Organisation of Screening for the pharmacological activity of new substances. Anti-inflammatory agents-carrageenan induced paw oedema, cotton pellet method. Anticonvulsants: Convulsions induced by chemicals, induced by electroshock, combined procedures. Sympatomimetic agents: Mydriasis, the uterus and ascending colon of the rat.	12 hours
	2. Introduction to Toxicology: Definition and types of toxicology, Basic principles of toxicology, Carcinogenicity, mutagenicity, teratogenicity, acute, sub acute and chronic toxicity. Detailed toxicity(mild/moderate/severe toxicity wherever applicable) and treatment of drugs such as salicylates/ paracetamol, opium, quinine, ethyl alcohol, etc. Toxic chemicals in the environment, impact of toxic chemicals on enzymes. Biochemical effects of arsenic, lead mercury, cadmium, carbon monoxide, pesticides and carcinogens.	12 hours
	3. Essentials of Analytical Toxicology Physicochemical, biochemical & genetic basis of toxicity; Principles of toxicokinetics, mutagenesis and carcinogenesis – Behavioural, inhalation toxicity, hypersensitivity and immune response, range finding tests – Acute, subacute and chronic toxicity studies. Classification of Toxins: Acute toxicity tests, Determination of LD ₅₀ value, Subacute tests - Histopathological and biochemical estimations on toxicity induced in animal models – Modern methods of analysis for Toxins-Barbiturate poisoning, Amphetamine poisoning.	12 hours

<u>Pedagogy:</u>	Lectures, assignments, presentations and case studies will be acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-502

Title of the Course: Calibration and Validation

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied practical course involving calibration of analytical instruments	
<u>Course Objective:</u>	To learn principles of calibration and validation of analytical instruments. To learn validation procedures for analytical instruments. To learn qualification of various analytical instruments.	
<u>Course Outcome</u>	A student will be able to apply calibration techniques to analytical instruments. A student will be able to validate analytical instruments. A student will be able to evaluate qualifications of analytical instruments.	
<u>Content:</u>	1. Calibration and Validation of Analytical Instruments Validation and calibration of various instruments used for drug analysis such as UV-Visible Spectrophotometer, IR Spectrophotometer, Spectrofluorimeter, HPLC, HPTLC and GC. Regulatory requirements for analytical method validation. International conference on harmonization (ICH) guideline Q2A:	12 hours
	2. Validation of analytical procedures Linearity and range criteria and their role in instrumental method validation Detailed discussion on accuracy and precision role in the method validation Role of quantification limit and specificity -Limit of Detection (LOD) and Limit of Quantification (LOQ) Robustness & method validation Ruggedness of chromatographic method Ruggedness of sample preparation procedure Complete method validation package, analytical data, protocol, plan, revisions, and change controls.	12 hours
	3. Qualification of analytical instruments Overview of qualification of some instruments. Overview of installation, operation, and performance qualification (IQ, OQ, PQ) of analytical equipment.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and field visits will be the acquired methods for learning.	
<u>References/Readings</u>	1. WHO guidelines (2014-2018) 2. Michael E. Swartz, <i>Analytical Method Development & Validation</i> , CRC Press, 1997. 3. Loftus & Nash, <i>Pharmaceutical Process Validation</i> , Dekker Incorporated, Marcel, 1984.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-503

Title of the Course: Polymers in Pharmaceuticals and novel drug delivery systems

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the topic on polymers in the TYBSc. Level	
<u>Course Objective:</u>	To learn classification synthesis and properties of polymers. To learn the role of polymers in drug delivery systems. To learn new innovations in drug delivery systems.	
<u>Course Outcome</u>	A student will be able to identify the type of polymers that can be used for drug delivery systems. A student will be able to get the knowledge of innovative drug delivery systems and apply it for their lab project.	
<u>Content:</u>	1. Introduction and Types of Polymers in Pharmaceuticals Classification, General methods of synthesis, properties, characterization and evaluation: Biodegradable polymers - Classification - Mechanism of biodegradation in the body. Polymer processing with respect to novel formulation design: Applications of polymers in novel drug delivery systems. Introduction to Novel Drug delivery systems, drug delivery carriers, routes of administration.	12 hours
	2. Polymers as Novel Drug Delivery systems Recent advances in drug delivery systems. Theory of controlled release drug delivery systems. Microencapsulation – Methods of encapsulation. Transdermal drug delivery systems – Theory, formulation, production and evaluation. Targeted drug delivery systems – concept of drug targeting, importance in therapeutics.	12 hours
	3. Recent Innovations in drug delivery systems Recent innovations in conventional dosage form like tablets, capsules, sterile dosage forms, pellets, Mucoadhesive system, GRDDS, peptide drug delivery, supercritical fluid technique, PEGylation, Nanoparticulate drug delivery. Future opportunities and challenges.	12 hours
<u>Pedagogy:</u>	Lectures, assignments, presentations and mini-projects will be the acquired methods for learning.	

References/Readings	<ol style="list-style-type: none"> 1. U.S. Beans, A.K. Beckett & J.E. Caralem, <i>Advances in Pharm Sci</i>, Vol 1-4, Elsevier, 2009. 2. G.S. ----------------------------	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-504

Title of the Course: Biopharmaceutics

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the concepts of drug metabolism at T Y B Sc level.	
<u>Course Objective:</u>	To learn ADMET. Drug absorption drug distribution Drug Action Drug metabolism and excretion To learn how bioavailability is important understanding the efficacy of a drug product.	
<u>Course Outcome</u>	A student will be able to relate drug absorption to bioavailability. A student will be able to get an in-depth knowledge of drug metabolism concept.	
<u>Content:</u>	1. Drug absorption, Dissolution and Distribution Based on cell membrane Gastro-intestinal absorption of drugs, mechanisms of drug absorption, factors affecting drug absorption: Biological, physiological, physico-chemical and pharmaceutical. Noyes-Whitney's dissolution rate law, study of various approaches to improve dissolution of poorly soluble drugs, In-vitro dissolution testing models, In-vitro-in-Vivo correlation. Factors affecting drug distribution, volume of distribution, protein binding – factors affecting, significance and kinetics of protein binding.	12 hours
	2. Drug Metabolism and Excretion Metabolism of drugs, Xenobiotics, Drug metabolizing organs and enzymes (microsomal & nonmicrosomal), Chemical pathways - Phase I reactions (Oxidative, reductive and hydrolytic reactions) and Phase II reactions (Conjugation), Significance of cytochrome P ₄₅₀ oxidation – reduction cycle, Factors affecting biotransformation of drugs. Renal excretion – Glomerular filtration, Active tubular secretion, Active (or) passive tubular reabsorption. Factors affecting renal excretions of drugs. Non renal excretions – Biliary, pulmonary, salivary, mammary, skin/dermal, gastrointestinal and genital excretions of drugs (Any two types)	12 hours
	3. Bioavailability and Bioequivalency studies Objectives and considerations in bioavailability studies, Concept of equivalents, Measurements of bioavailability, Determination of the rate of absorption, Bioequivalence studies and its importance,. Biopharmaceutical classification of drugs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.

--	--	--

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-505

Title of the Course: Pharmaceutical Technology

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have some knowledge on pharmaceutical technology.	
<u>Course Objective:</u>	To learn unit processes involving various chemical reactions. To learn industrial synthesis of selected list of drugs. To learn the need for pilot plant in industry and also the flowchart on various manufacturing methods of drugs.	
<u>Course Outcome</u>	A student will be able to explain unit processes for various chemical reactions. A student will be able to apply industrial synthesis knowledge for the synthesis of drug like molecules in laboratory. A student will be able to apply the knowledge of effluent treatment methods.	
<u>Content:</u>	1. Unit Processes Concept of unit processes in systematization of chemical reactions, explanation of one example each for unit processes: Alkylation, amination, (by ammonolysis, reduction), carbonylation, carboxylation, condensation, dehydration, diazotization, disproportionation, esterification, halogenation, hydration, hydroformylation, hydrogenation, hydrolysis, hydroxylation, nitration, oxidation and reduction. 2. Industrial Synthesis Introduction to pharmaceutical manufacturing – raw materials, detailed manufacturing procedure, therapeutic function, common name, chemical name, structural formulae of the following drugs :Acyclovir, alprazolam, propranolol, naproxen, ibuprofen, aspirin, levodopa and cimetidine. Lidocaine, ethambutal hydrochloride, 5-fluorouracil, amoxycillin sodium. 3. Process Development & Process Optimization a) Pilot- plant – Introduction – Appraisal for the need of pilot – plant – pilot plant (Vs) Small scale plant – Benefits of Pilot plant – Broad guidelines of process development. b) Industrial manufacturing method and flow charts of Sulphamethoxazole, Ciprofloxacin, and Rifampicin. Environment Health & Safety: Introduction to industrial effluents. Classification of effluents. Classification of basic methods of purifying effluents.	12 hours 12 hours 12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group discussion will be the acquired methods for learning.	
<u>References/Readings</u>	1. B.K. Sharma, <i>Industrial Chemistry</i> , Narosa Publishing House, 1998, 1 st Ed. 2. B.K. Sharma, <i>Environmental Chemistry</i> . Narosa Publishing House , 1998, 1 st Ed

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-506

Title of the Course: Pharmaceutical Stability

Number of Credits: 3

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied some knowledge on stability of drugs	
<u>Course Objective:</u>	To learn to predict shelf life and half life of pharmaceutical formulations. To learn various stability protocols and also stability terminologies as given in ICH guidelines I To learn ICH guideline II that is thorough investigation into stability labs.	
<u>Course Outcome</u>	A student will be able to explain fundamentals of stability studies. A student will be able to determine stability requirements for OTC drug products. A student will be able to make a stability labs ready for FDA inspection.	
<u>Content:</u>	1. Fundamentals of Stability Basic concept and objectives of stability study. Fundamentals of stability testing requirements. Order of reaction and their applications in predicting shelf life and half-life of Pharmaceutical formulations.	12 hours
	2. ICH Guidelines-I Review ICH process and ICH updates on stability Common terminology and acronyms. Review current Q1A, Q1B, Q1D, Q1F, Q2, Q3 and Q6 guidelines Determine stability requirements for OTC products Stability SOPs Stability protocols and data Design of a compliant bracketing and matrixing.	12 hours
	3. ICH Guidelines-II ICH guidelines on bracketing and matrixing Stability testing laboratory Design and validation stability test procedures Stability data management system Investigation procedures of OOS stability results FDA inspection of stability labs.	12 hours
<u>Pedagogy:</u>	Lectures assignments presentations and group project will be the acquired methods for learning.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-507

Title of the Course: Laboratory Course in Natural Product Analysis

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the theory topics in natural products at TYBSc. Level.	
<u>Course Objective:</u>	To introduce the practical component in natural product analysis. To learn various methods involved in the analysis of natural products.	
<u>Course Outcome</u>	A student will be able to Isolate natural products. A student will be able to synthesize natural products. A student will be able to characterize natural products by physical methods of analysis.	
<u>Content:</u>	<ol style="list-style-type: none">1) Isolation of Caffeine from tea, coffee etc. and purification by microscale sublimation. Characterization of pure caffeine by IR.2) Isolation of Cinnamaldehyde from Cinnamon by microscale steam distillation. Characterization and interpretation of isolated Cinnamaldehyde by IR.3) Enzymatic reduction of ethylacetoacetate using Baker's yeast.4) Thin layer Chromatography for separation of mixtures of natural products/Market Formulations.5) Column chromatography of two component mixture of natural products/Market Formulations.6) Conversion of camphene to isobornyl acetate7) Hydrolysis of isobornyl acetate to isoborneol8) Oxidation of isoborneol to Camphor.9) Transformation of Benzaldehyde to Benzoin using thiamine B12 as a coenzyme.10) Isolation of cholesterol from gallstones11) Determination of Acid Value of Fixed Oil.12) Determination of Saponification Value of Fixed Oil.13) Determination of Eugenol in Clove Oil.14) Qualitative analysis of natural products (Comprises of amino acids, carbohydrates, proteins, alkaloids, glycosides, steriods, flavonoids)15) Isolation of piperine from black pepper powder. Characterization and interpretation of isolated Cinnamaldehyde by IR.16) Isolation of calcium citrate from lemon juice.	48 hours
<u>Pedagogy:</u>	Laboratory work.. pre-lab and post-lab exercises mini-projects will be given to students.	
<u>References/Readings</u>	1. D.W.Mayo, R.M. Pike & P.K. Trumper, <i>Microscale Organic laboratory</i> , John Wiley and Sons, 1994, , 3 rd Ed.

Effective from AY: 2018-19

Prerequisites for the course:	Should have knowledge of drug dosage forms and drug formulations	
Course Objective:	To learn preparations of variety of pharmaceutical formulations. To learn quality control evaluation methods of tablets. To learn the principle instrumentation and working of dissolution apparatus.	
Course Outcome	A student will be able to prepare various drug formulations and analyze them. A student will be able to evaluate tablets qualitatively using analytical instruments. A student will be able to handle dissolution apparatus and carry out various dissolution experiments to evaluate bioavailability.	
Content:	<p>1) Preparation of pharmaceutical dosage forms and Quality Control Analysis other than Assays:</p> <ul style="list-style-type: none"> i) Concentrated Dill Water ii) Aqueous Iodine Solution I. P iii) Merbromin solution NF 11 iv) Cresol with soap solution I.P. v) Calamine Lotion IP vi) Calamine Cream aqueous BPC. vii) Elixir, Paediatric B.P.C. and Pain balm viii) Cough Expectorant and Antacid suspension ix) Simple ointment IP and Sulphur Ointment IP x) Non-Staining Iodine Ointment BPC and Non-staining iodine ointment with methyl salicylate (BPC) xi) Liniment (BPC) <p>2) Quality Control Evaluation of Tablets and Capsules</p> <p>6 experiments using different types of tablets and capsules of 4 hours each</p> <p>3) Dissolution Experiments</p> <ul style="list-style-type: none"> i) Validation, qualification, Calibration of dissolution Test Apparatus. ii) Carbamazepine tablets iii) Paracetamol tablets iv) Diclofenac sodium tablets v) Combination drugs 	<p>42 hours</p> <p>24 hours</p> <p>30 hours</p>
Pedagogy:	Laboratory work. pre-lab and post-lab exercises mini-projects will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-509

Title of the Course: Laboratory Course in Drug Design, Molecular Docking and Patents

Number of Credits: 2

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have knowledge of structure drawing at T Y B Sc level.	
<u>Course Objective:</u>	To learn drug designing through drug discovery experiments (drug simulations) To learn to use molecular docking software packages. To learn about patenting in pharmaceuticals.	
<u>Course Outcome</u>	A student will be able to synthesize drug molecules carry out in vitro bioassay and drug simulation studies. A student will be able use various molecular docking softwares for designing certain drug targets. A student will be able to know the procedure to pharmaceutical patent can be filed.	
<u>Content:</u>	1) Drug Design and Discovery experiments 1. Synthesis of Aspirin and Oil of Winter green and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 2. Synthesis of Sulphacetamide and Sulphamethoxazole and its physical properties, <i>in vitro</i> biological assays and drug simulation studies. 3. Synthesis of acetanilide and paracetamol and its physical properties, <i>in vitro</i> biological assays and drug simulation studies.	16 hours
	2) Molecular Docking Experiments Use of software packages in chemistry for the following: To write a computer program to obtain a slope and intercept for linear data using least square fit. 1. Use of ChemDraw, ISISDraw for drawing structures, chemical reactions, equations. 2. Molecular docking softwares such as Hex software or autodocking. 3. Energy minimization of molecules and finding intermolecular interactions of small molecule with macromolecule such as inhibitor, thymidilate synthase, glycogen synthase, E.Coli protease. 4. Viewing Tools and Graphics Tools • Rasmol (http://www.umass.edu/microbio/rasmol/) • VMD (http://www.ks.uiuc.edu/Research/vmd/) • Molscrip (http://www.avatar.se/molscrip/) 6. The use of molecular dynamics techniques for drug discovery using NAMD (http://www.ks.uiuc.edu/Research/namd/). Tutorials are at http://www.ks.uiuc.edu/Training/Tutorials/ . 7. Docking of small molecules to protein targets using Autodock	24 hours

	<p>(http://autodock.scripps.edu/). Tutorials are at http://autodock.scripps.edu/faqshelp/tutorial/using-autodock-4-with-autodocktools.</p> <p>3) Patents</p> <ul style="list-style-type: none"> i) Prior Art Search on Target Drug (Any 2) ii) Patent Filing procedures (Any two case studies) 	8 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations will be given to students.

Programme: M. Sc. (Pharmaceutical Chemistry)

Course Code: HCO-510

Title of the Course: Laboratory Course in Quality Control and Quality Assurance

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	Should have studied the analysis of pharmaceuticals at TYBSc. Level.	
<u>Course Objective:</u>	To learn quality control analysis of drugs using analytical instruments. To learn to perform quality assurance experiments	
<u>Course Outcome</u>	A student will be able to use UV spectrophotometer dissolution apparatus high performance liquid chromatograph (HPLC) and Infra Red spectrophotometer. For quality control analysis of drugs. A student will be able to perform quality assurance experiments.	
<u>Content:</u>	I) Quality Control Analysis Experiments Spectrophotometric Analysis 1) Determination of % purity of a given sample of Chloramphenicol capsules IP. 2) Determination of % purity of a given sample of Furosemide injection IP. 3) Determination of % purity of a given sample of Allopurinol tablets IP. 4) Determination of % purity of a given sample of Propranolol HCl tablets IP.	16 hours
	Dissolution Analysis (Any 2) 1) Dissolution rate study of sustained release Theophylline tablets IP. 2) Dissolution rate study of sustained release Diclofenac tablets IP. 3) Analysis of Diclofenac sodium and paracetamol in combined dosage form.	12 hours
	Chromatographic Techniques in Pharmaceuticals: 1) To identify the given drug amongst the paracetamol, aspirin and caffeine citrate with the help of thin layer chromatography and calculate its <i>R_f</i> value. 2) To identify the given sulpha drug among the sulphadiazine, sulphamethoxazole and trimethoprim with the help of thin layer chromatography and calculate its <i>R_f</i> value. 3) To perform the Separation of amino acids by paper chromatography. 4) To identify the given sample of sugar with the help of ascending paper chromatography and calculate its <i>R_f</i> value. 5) To demonstrate high Performance liquid chromatography and analyse Diazepam Tablets by High Pressure Liquid Chromatography.	24 hours

	6) To develop and validate the analytical method of any one drug using high performance liquid chromatography. 7) To analyze the given tablets of paracetamol/ibuprofen-paracetamol combination HPTLC method. 8) Separation of mixture of o-nitroaniline and p-nitroaniline using column chromatography. Infrared Spectroscopic analysis Demonstration of Instrumentation and Interpretation of Representative Spectra a) To differentiate between analgesic-NSAIDs :Aspirin, Ibuprofen, Paracetamol. b) To differentiate between Acetophenone, p-Nitroacetophenone, Benzamide. c) To interpret the I.R. spectra of the following compounds: Benzyl alcohol, Benzaldehyde, Acetanilide, Ethylacetate, Ethyl methyl ketone, m-nitroaniline.	8 hours
	II) Quality Assurance Experiments (Any 9) 1) Evaluation of Riboflavin/Ibuprofen tablets I .P. to characterize and evaluate the effect of different concentrations of binders and disintegrant. 2) Design and fabrication of theophylline sustained release formulation and comparison of its release profile with the conventional dosage form. 3) Formulation and evaluation of micronized disperse system for parenteral delivery of drugs including test for pyrogens and sterility testing etc. 4) Preparation of solid dispersions of poorly water soluble drugs using different carriers and to study the release profile and compare with conventional dosage forms. 5) Disintegration and dissolution of per oral tablets. 6) Influence of vehicle on drug availability from topical dosage forms in-vitro. 7) Design and preparation of a suspension and its evaluation. 8) Development of moisture resistant coating formulation for Amoxicillin tablets/ Ranitidine tablets. 9) Quality control of paper, Plastic and glass container. 10)Quality control of labels and label adhesives. 11)Microbial limit test in oral products. 12)Validation of sterilization equipments e.g. Hot air oven, Autoclave. 13)Validation of Analytical procedure.	36 hours
Pedagogy:	Laboratory work.. pre-lab and post-lab exercises presentations and case studies will be given to students.

Programme: M. Sc. Part-II (Chemistry)

Course Code: CGO-501

Title of the Course: Selected Experiments in Chemistry

Number of Credits: 8

Effective from AY: 2019-20

Prerequisites for the course:	Should have studied the theory and practical courses in Analytical, Inorganic, Organic and Physical Chemistry at MSc-I level so as to have basic knowledge of experiments in chemistry.	
Course Objectives:	<p><i>This course is in lieu of Dissertation (8 credits) and is to be opted by those students who are not opting the dissertation at part-II level. Consequently, the course will be taught over two semesters (III and IV, 4 credits in each semester). The objectives and outcomes are thus defined considering the requirements of experimental Analytical, Inorganic, Organic and Physical Chemistry.</i></p> <ol style="list-style-type: none">1. Introduction of various instrumental techniques for analysis.2. Learning data analysis, handling and interpretation of spectra.3. To learn techniques of crystallization of ligands and synthesis of coordination compounds.4. To learn characterization of compounds using different instruments.5. To introduce analysis of ores for metal content.6. To translate certain theoretical concepts learnt earlier into experimental knowledge by providing hands on experience of basic laboratory techniques required for organic syntheses.7. To train the students in application of theoretical concepts related to organic spectroscopy by interpreting various spectra (UV, IR, NMR, Mass, 2D NMR etc.) of organic compounds.8. To impart experimental knowledge regarding computational and theoretical concepts in physical chemistry.9. To introduce synthesis methods of nanomaterials and nanoporous materials.10. To introduce computational techniques in physical chemistry.	
Course Outcomes:	<ol style="list-style-type: none">1. Students should be in a position to use different instruments for qualitative and quantitative analysis.2. To gain experience with some statistics to analyse data in lab.3. Students will be able to understand the methods of syntheses and characterization of coordination compounds4. Students will be in a position to synthesis, characterize and measure the solid state properties of oxide materials.5. Students shall gain the understanding of:<ol style="list-style-type: none">i. Stoichiometric requirements during organic syntheses.ii. Safe and Good laboratory practices, handling laboratory glassware, equipment and chemical reagents.iii. Common laboratory techniques including reflux, distillation, steam distillation, vacuum distillation, aqueous extraction, thin layer chromatography (TLC), reactions under dry conditions, use of	

	<p>microwave, photochemistry, low temperature synthesis etc.</p> <p>iv. Use of organic spectroscopic techniques in monitoring the organic syntheses.</p> <p>6. Students should be in a position to understand mathematical and theoretical methods in chemistry.</p> <p>7. Students will be able to understand different methods for syntheses and characterization of nanomaterials and nanoporous materials.</p> <p>8. Students will understand the concepts of phase rule and adsorption.</p>	
Content:	<p>Unit-I: Analytical Chemistry- Instrumental methods of analysis. (Minimum 08 experiments to be performed.)</p> <ol style="list-style-type: none"> Potentiometric determination of dissociation constant of Cu-ammonia complex. Potentiometric titration of Zn^{2+} against $[Fe(CN)_6]^{4-}$ and determination of the empirical formula of the complex formed. To record and interpret the cyclic voltammogram for potassium ferricyanide $[K_3Fe(CN)_6]$ Kinetic investigation for Fe^{2+}/Fe^{3+} system using cyclic voltammetry To study the fluorescence spectroscopy by recording spectra for following compounds (Quinine sulphate and Anthracene) and compare the data of two compounds Quantitative determination of amount of anthracene/quinine sulphate using fluorescence spectroscopy Fractionation (based on polarity) of given mixture by Solvent extraction protocol followed by recovery of separated analyte using rotary evaporator and determination of purity by TLC analysis Separation of a mixture of o- and p- nitro anilines on an alumina column chromatography and recovery, reuse of mobile phase using rotary evaporator. Calibration of IR spectrophotometer using polystyrene film and to check the performance of the instrument. Estimation of aspirin and caffeine from APC tablet by UV-Visible spectrophotometry. <p>Unit-II: Inorganic Chemistry</p> <p>Group-1: Preparation of ligands (including distillation/ recrystallization) / metal-ligand compounds / inorganic compounds / crystal structure analysis: (Any 4 experiments)</p> <ol style="list-style-type: none"> Preparation of Schiff base and characterization. Preparation of substituted benzoic acids and characterization. Preparation of acetylacetonate complexes of Co(II) and Co(III) and estimation of cobalt. Preparation of a polyoxometallate and characterization Preparation of aluminium(III)tris(acetylacetonate) and estimation of aluminium. Preparation of potassium dihydroxodioxalatotitanate(IV) and estimation of titanium. 	<p>48 hours</p> <p>24 Hours</p>

	<ul style="list-style-type: none"> ii. Benzidine from hydrazobenzene (benzidine rearrangement). iii. Methyl orange/red from sulphanilic acid/anthranilic acid (diazotization). iv. Benzil to hydrobenzoin (NaBH_4 reduction). v. Photochemical transformation of benzophenone to Benzpinacol. vi. 2-(4-Methyl benzoyl) benzoic acid from phthalic anhydride and toluene (F-C reaction). vii. 2-(4-Methyl benzoyl) benzoic acid to methyl anthraquinone (PPA cyclisation). viii. Resolution of racemic phenyl ethylamine using tartaric acid. ix. Trans-Stilbene by Wittig reaction. x. Enamine alkylation :2- methyl cyclohexanone pyrrolidine enamine with CH_3I. <p>Unit IV: Physical Chemistry</p> <p>I. Computational Chemistry (Any Three Experiments.)</p> <ul style="list-style-type: none"> 1. Plotting various types of graphs viz. straight lines, exponential, Gaussians, orbitals, first and second derivative plots. 2. Working with molecular coordinates: Distance matrix, center of mass, bond angles, dihedral angles, bond lengths, moment of inertia. 3. Electronic Structure of Diborane using the nwchem default density functional and basis sets. 4. Vibrational Spectroscopy of Transition Metal Nitrosyls complexes using ab initio calculations. <p>II. Experimental physical chemistry (Any Five Experiments)</p> <ul style="list-style-type: none"> 1. Preparation of a transition metal oxide (ZnO / NiO) by three different precursors and their characterization by IR and XRD. 2. Synthesis of a photo catalyst (TiO_2 / ZnO) by two different precursors and study kinetics of adsorption and photocatalytic degradation of a suitable azo dye as pollutant. 3. Adsorption studies on the porous adsorbents and fitting the adsorption data using Freundlich and Langmuir adsorption isotherms. 4. To study the thermodynamics of the adsorption process and to determine thermodynamic parameters such as ΔS and ΔG of the adsorption process. 5. Synthesis of spherical and rod shaped colloidal silver nanoparticles and to perform stability and surface plasmon resonance (SPR) analysis using UV-vis spectrophotometer. 6. To study the three component system such as chloroform, acetic acid and water and to obtain tie lines and plait point. Plotting the composition of mixture on a ternary phase diagram. 	<p>18 hrs</p> <p>30 hrs</p>
Pedagogy:	Prelab exercises/assignments/ presentations/ lab hand-out or a combination of some of these. Sessions shall be interactive in nature to enable peer group learning.

--	--	--

Note: The course would be taught over entire academic year with practicals from any two specializations in odd semester (III) and remaining two in the even (IV) semester. The ISA and SEA would be conducted in each of the semesters and final marks will be computed only at the end of even semester. Thus, students opting the course will be divided in to four batches and two of them together will undertake practicals in two specializations in one semester and remaining two in the next semester.

Bachelor of Library and Information Science (B.L.I.Sc.)

Goa University

Goa University Library, Taleigao Plateau
Goa PIN 403 206

Website: www.unigoa.ac.in

Tel: 0832-6519072/272/087, Fax: 0832-2451184

Bachelor of Library and Information Science (B.L.I.Sc.) Programme

Duration of the Programme : One Year Programme
(Credit based two semesters)

Objectives of the Programme :

- To train students for a professional career in Library and Information Services
- To produce a quality manpower for collection, compilation and dissemination of information products and services in and beyond conventional libraries and information centres

Number of seats : 25

Availability and Reservation of Seats

Total number seats available for admission are 25. University shall allocate seats as per State Government/University policy. Accordingly, the distribution of seats will be as follows.

Sl No	Category	Seats
1	OBC	7
2	SC	1
3	ST	3
4	Differentially abled	1
5	General	11
6	Other Universities	2
	Total	25

Qualification for admission :

Graduates in any faculty like Languages and Literature, Social sciences, Commerce, Natural Sciences, Life Sciences and Environment, Engineering, Medicine, etc with minimum 40% aggregate marks at their graduation from any recognized university in India or abroad are eligible to apply for the B.L.I.Sc.

Evaluation :

The assessment of the Programmes comprises of continuous Intra-Semester Assessment (ISA) and Semester End Assessment (SEA) and is done fully internally.

Fee details :

Item	For Goa University Students	For Outside Students
Tuition Fee	18900	18900
Reg. Fee (GU Students)	500	0
(Outside Students)	0	2300
Gym, Stud. Union, ID Card	410	410
Student Aid Fund	120	120
Computer Lab facility	810	810
Annual Internet Fee	230	230
Annual Library Fee	460	460
Caution Deposit (Refundable)	1750	1750
Total	23180	24980

Curriculum details :

Curriculum details for B.L.I.Sc. Programme are given in the table below. Semester wise syllabus is also provided.

Semester I					
Sl No	Course code	Course Title		Credits	Marks
1	BLC 101	Library Information and Society	T	3	75
2	BLC 102	Reference and Information Sources	T	3	75
3	BLC 103	Information Processing and Retrieval I- Classification	T	3	75
4	BLC 104	Information Processing and Retrieval II- Classification	P	2	50
5	BLC 105	Management of Library and Information Centers	T	5	125
6	BLC 106	Information Services and Systems	T	4	100
				20	500
Semester II					
7	BLC 201	Fundamentals of Information Technology (Theory)	T	5	125
8	BLC 202	Information Processing and Retrieval III- Cataloguing	T	4	100
9	BLC 203	Information Processing and Retrieval IV- Cataloguing	P	1	25
10	BLC 204	Information Technology (Practical)	P	2	50
11	BLC 205	Digital Content Development and e-publishing	T	4	100
12	BLC 206	Digital Information Management	T	4	100
				20	500

Credit based Semester Syllabus for
Bachelor of Library and Information Science (BLISc)
First Semester
BLC 101 - Library, Information and Society

(3 Credits / 75 Marks)

Unit -1

- Social and historical foundations of Library: Library as an institution and its evolution, History, Library as a socio and cultural institution.
- Library movement in India.
- Different types of Libraries - functions, objectives, and activities.
- Information - Definitions, Contributions of Belkin, Robertson, Derwin, Ingwersen, etc.
- Information, Information Science, Information as a resource/commodity, Information society.
- Information Transfer Cycle-Generation, Collection, Storage and dissemination.
- Role of Information in planning, Management, Socio-economic development, Technology transfer.
- Communication theories and models. Barriers to communication. Levels of communications – Intrapersonal, interpersonal and mass communication.

15 Hours

Unit -2

- Five laws of Library Science and their implications.
- Development of Libraries in India with special reference to Goa
- Library legislation – Need and purpose. Library legislation in India – problems and prospects.
- Overview of public Library acts in Indian States, Detailed study of Goa Public Library Act 1993.

- Delivery of Books (Public Libraries) and News paper Act, 1954 and 1956, Intellectual Property Rights (IPR) and Copyright Act, Right to Information Act.

15 Hours

Unit - 3

- Library and Information Profession: Attributes of a profession, Librarianship as a profession, Professional ethics and qualities, Professional education and research.
- Professional associations – Objectives and functions, Role of professional associations in Library development; Regional Library associations- KALA; National Library associations - ILA, IATLIS, IASLIC ; International Library associations – IFLA, FID,ALA, SLA, and LA.
- Promoters of Library and Information services: National level - RRRLF, International level – UNESCO. Public relations and extension activities.
- National Knowledge Commission (NKC) and its role.

15 Hours

Selected Readings:

1. Burahohan, A. (2000). Various aspects of librarianship and Information Science. New Delhi: ESS ESS.
2. Chapman, E.A. and Lynden, F.C. (2000). Advances in librarianship. 24th Vol. San Diego: Academic Press.

BLC 102 - Reference and Information Sources

(3 Credits / 75 Marks)

Unit -1

- Information sources: Meaning, Definition, Nature, Evolution, Characteristics, Functions, Importance, and Criteria for evaluation.
- Types of sources (Primary, Secondary & Tertiary (print and electronic), Human and Institutional sources)
- Primary sources- Structures and components journals; Patents; Technical Reports, Standards and Specifications; Conference proceedings; Trade literature; Theses and Dissertations.
- Electronic sources: Internet Information resources, Databases (Bibliographic, Numeric and Full text). E-books, Open Access Resources. List servers, Subject gateways.
- Study of the features and functionality of electronic resources (E.g. Dictionary. com, Encyclopedia Britannica, Wikipedia, ACM digital Library, IEEE / IEE Electronic Library Online (IEL), Emerald, EBSCO,

PsycINFO, Elsevier Science, PubMed Central, J-Gate , J-Store, Web of Science, SCOPUS, SciFinder Scholar, PLOS, DOAJ, RePEc, etc.)

15 Hours

Unit -2

- Secondary sources- Dictionaries, Encyclopedias, Yearbooks and Almanacs, Biographical sources, Geographical sources, Bibliographical sources, Abstracting and Indexing periodicals, Handbooks and Manuals, Current sources, and Statistical Information sources.
- Tertiary sources - Directories, Guides to reference sources, Bibliography of bibliographies, Monographs, Union Catalogues, Textbooks, etc. 15 Hours

Unit -3

- Human Sources: Technological gatekeepers, Invisible colleges, Information consultants, Experts/ Resource persons, Representatives of firms, Personal home pages, common men (priest, village head, postman, receptionist, etc.) and others.
- Institutional / Organisational Sources: Government, Ministries and departments, R& D organizations, Learned societies, Publishing houses, Press, Broadcasting stations, Museums, Archives, Data banks, Information analysis centers, Referral centers, Exhibitions & trade fairs. Institutional web sites, etc. 15 Hours

Selected Readings:

1. Alan P., Gwyneth T. and Goff S.(1999). The Library and Information Professional's Guide to the World Wide Web. London : Facet Publishing.
2. Chowdhury, G. G. and Sudatta Chowdhury(2001). Searching CD-ROM and Online Information Sources. London : Facet Publishing.
3. Chowdhury, G. G. and Sudatta Chowdhury(2001). Information Sources and Searching on the World Wide Web. London: Facet Publishing.

- 16.<http://www.infolibrarian.com>

BLC 103 - Information Processing and Retrieval - I: Classification

(3 Credits / 75 Marks)

Unit -1

- Classification – Meaning, Definition.
- Library Classification – Definitions, Need, Purpose and Functions. Understanding the developments in theory of Library Classification. Study of the contributions of E.C. Richardson, H.E. Bliss, W.C. Berwick Sayer, J.D. Brown, E.W. Hulme, CRG, and S.R. Ranganathan.
- Types of Classification schemes. Understanding the concept of and schemes in Knowledge Classification. Knowledge Classification vs. Library Classification. Understanding the Knowledge Classification Systems such as Vedic Classification, Greek Classification. General theory of Library Classification. 15 Hours

Unit-2

- Normative Principles of Classification, Three planes of work. Canons, Principles and Postulates. Devices, Mnemonics. Five fundamental categories and Notation.

- Universe of subjects – Concept, Definition, Structure, and Attributes of subjects. Spiral of Scientific Method; Modes of Formation of Subjects, Different types of subjects. Universe of Knowledge as mapped in different schemes of Classification. Call number and its structure. 10 Hours

Unit 3

- Fundamental categories: Facet analysis and facet sequence, Phase relations, Common Isolates.
- Notational system: Meaning, need, functions and types, mnemonics, Hospitality in array and chain, Devices.
- Classification schemes: Standard schemes of Classifications and their features: CC, DDC, and UDC.
- Classification Research Group (CRG).
- Design and development of schemes of Library Classification. 10 Hours

Unit 4

- Trends in Library Classification, Thesaurofacet, Classaurus, Automatic Classification, Classification in online systems, Web Dewey.
- Knowledge Organisation Systems: Concepts. Facet Ontologies, Folksanonomies, OWL, SKOS. Taxonomies, Authority Files. Knowledge Organisation in Digital Environment 10 Hours

Selected Readings:

1. Berwick Sayers, W.C.(1950). Introduction to Library Classification. London: Andra dautch.
2. Chernyi, A.I.(1973). Introduction to Information retrieval theory. London: ASLIB.
3. Dhyani, P.(1998). Library Classification: Theory and practice. New Delhi: Vishwa Prakashan.
4. Jennifer, E. R.(1987). Organising knowledge: An introduction to Information retrieval. Aldershot: Gower.
5. Krishan Kumar (1980). Theory of Library Classification, 2 Ed. New Delhi: Vikas.

6. Parkhi, R.S. (1977). Library Classification: Evolution of a dynamic theory. Bombay: Asia.

10. Ranganathan, S.R. (1999). The five laws of Library Science. Bangalore: Sarada Ranganathan Endowment for Library Science.
11. Rijsbergen, C.J. V.(1970). Information retrieval, 2nd ed., London: Butterworths.
12. Sinha, S.C. & Dhiman, A.K.(2002). Prolegomena to universe of knowledge. New Delhi: ESS ESS.
13. Srivastava, A.P.(1993). Theory of knowledge Classification in Libraries. New Delhi: Sage.

BLC – 104 Information Processing and Retrieval II - Classification
(Practice)

(2 Credits / 50 Marks)

Classifying the documents according to Dewey Decimal Classification (Latest edition)

Unit 1

- Classification of simple documents. 25 Hours

Unit 2

- Classification of documents using common auxiliary tables. 20 Hours

Unit 3

- Classification of documents using special auxiliary tables. 20 Hours

Unit 4

- Classification of complex documents.

25 Hours

Selected Readings:

1. Raju, A. A. N. (1985) Universal Decimal and Colon Classification
2. Chan, Lois mai and others: Dewey decimal classification. A practical guide. 2nd Edition, Albany, New York :OCLC.
3. Satija, M.P. and Comaromi, J. P. (1998). Exercises in the 21th Edition of Dewey Decimal Classification. New Delhi: Concept
4. Latest edition of Decimal Classification

BLC 105 - Management of Libraries and Information Centers

(5 Credits / 125 Marks)

Unit -1

- Management – meaning and definitions. Role, functions and principles of management. Schools of thought in management. Levels of management. Functions and principles of management; Application to Library and Information Centers. Organizational structure.

10 Hours

Unit -2

- *Functional units of Library and Information Centre.*
- Acquisitions section: Functions and procedures.
- Technical section: Functions and procedures.
- Circulation section: Functions. Methods of charging and discharging systems.
- Periodical section and its functions and activities.
- Reference and customer care service.

30 Hours

Unit -3

1. Collection development – Book selection policies and principles for print and electronic resources. Problems of Collection development for print and electronic

resources (including licensing). Online Bookstores – Identification, Advantages. Online book shops Vs. Traditional book shops.

2. Collection management: Stock rectification. Weeding of resources. Conservation and preservation of Library resources.

3.

10 Hours

Unit -4

- Financial management. Sources of finance. Mobilization of financial resources. Budgeting - methods and techniques. Budgetary Control, Out sourcing.
- Human Resource Management: Job Analysis and Description, Job Evaluation; Inter-personal Relations; Staff selection and recruitment; Motivation, Delegation, Decision Making; Education, Training and Development; Job evaluation and Performance Appraisal; Cost effectiveness and Cost benefit analysis (PERT & CPM) Leadership Qualities.

15 Hours

Unit -5

- Library Buildings and Equipments.
- Performance Evaluation of Library and Information Centers,
- Total Quality Management (TQM).
- Library committee. Library rules and regulations. Library statistics. Annual reports.

- 10 Hours

Selected Readings:

1. Beardwell, I. & Holden, L. Ed.(1996). Human resource management: Contemporary perspective. New Delhi: McMillan.
2. Bratton, J. and Gold, J. (1994). Human resource management: Theory and practice. Basingstoke: Mac Millan.
3. Brophy, P. and Courling K.(1997). Quality management for Information and Library managers. Bombay: Jaico.
4. Bryson, J.O. (1996). Effective Library and Information management. Bombay: Jaico.

5. Edward, E. G.(1982). Techniques for librarians. NY: Academic,
6. Evans, E.G. Ed.(1986). Management Information systems. New Delhi: S. Chand & Co.
7. IASLIC (1979). Application of management techniques in Library and Information systems. (Conference Papers). Kolkata : IASLIC.
8. Katz, W.A.(1980). Collection development selection of materials for Libraries. New York: HRW.
9. Krishna Kumar (1987). Library administration and management. Delhi: Viaks.
10. Kumar, P.S.G. (2003). Management of Library and Information Centres. Delhi: B. R. Publishing corporation.
11. Mahapatra, P.(1997). Library management. Calcutta: World Press.
12. Mittal, R.L. (1984). Library administration: Theory and practice. 4 Ed. New Delhi: Metropolitan.
13. Paliwal, P.K. (2000). Compendium of Library administration. New Delhi: ESS ESS.
14. Paranjpe, V. (1997). Strategic human resource management. New Delhi: Allied.
15. Parker, C. and Café, T.(1993). Management Information systems: Strategy and action. New York: McGraw Hill.
16. Pearson, R.J. Ed.(1983). Management process: Selection of readings for librarians. Chicago: ALA.
17. Ranganathan, S.R. (1954). Library administration. Bangalore: Sharada Ranganathan Endowment for Library Science.
18. Siwatch, A. S.(2004). Library management: Leadership style strategies and organizational climate. New Delhi: Shree.
19. Stuart, R.D. and Moran, B.B.(2004). Library and Information center management. Colorado: Libraries unlimited.

BLC 106 – Information Services and Systems

(4 Credits / 100 Marks)

Unit 1

- Information systems: Basic concepts, Meaning, Objectives and Functions.

- Components of Information System: Structure, Functions and Services, Libraries, Documentation Centres, Information centres, Data centres, Information analysis centres, Clearing houses, Data banks, Data Curation centres, Museums, Memories, Institutional Repositories, Open Archives, Referral, Translation Centres, and Publishing Houses.
- 15 Hours

Unit 2

- Understanding the different systems and their services. Understanding the user communities- Identification of user communities; Introduction to the user centered approach to Information seeking behavior. User Education - methods and techniques. User studies.
- 15 Hours

Unit 3

- Study of National Documentation Centres, Information Systems and programmes- NISCAIR, DESIDOC, NASSDOC.
 - Study of International Information Systems and programmes- CAS, INSPEC, AGRIS, BIOSIS, INIS, MEDLARS, ASINFO, COMPENDEX. ISI.
 - Resource Sharing and Networks: Consortia- Importance and objectives. Study of Information networks- OCLC, INFLIBNET, UGC-INFONET, DELNET, National Knowledge Resource Consortia (NKRC) and AICTE-INDEST Consortium.
 - Information policies and programmes. Planning, Design and Evaluation of Information systems.
- 15 Hours

Unit 4

- Information Services- Reference and Documentation Services: Introduction to references services, Examination of reference collection for various types of

Libraries. Current Awareness Services (CAS): SDI service. Abstracting service - Abstracting techniques, Types of abstract, abstracting writing (style, content) Abstracting bulletins. Indexing services. Alerting services- List Servs and other email based services. Survey of List servs in different disciplines. FAQs –Developing FAQs – methods and techniques.

- Virtual Reference Desk. VRD- Management, technology and resources. The evolution of VRD. Major VRD projects. Virtual Libraries. Developing portals and virtual Libraries. Data mining for Information. 15 Hours

Selected Readings:

1. Sunitha Asija(1998). Documentation services in India: A review of some selected documentation centres. New Delhi: Academic Publications.
2. Guha, B. (1983). Documentation and Information: Services, techniques and systems. Calcutta: World Press.
3. Gupta, B.M. and others(1991). Handbook of Libraries, archives, Information centres in India. New Delhi: Aditya Prakshan.
4. Krishan Kumar (1990). Reference service. New Delhi, Vikas.
5. Lucas, Amy. Ed.(1989). Encyclopaedia of Information systems and services. Detroit: Gale Research.
6. Neelameghan A. and Prasad, K.N. Eds. (2005).Information systems and services in India. Bangalore: SRELS.
7. Vickery, B.(1987). Information systems. London: Butterworths.

**Credit based Semester Syllabus for
Bachelor of Library and Information Science (B.L.I.Sc.)**

Second Semester

BLC-201 Fundamentals of Information Technology

(5 Credits / 125 Marks)

Unit 1

- Information Technology - Concepts, Definition, Components and applications
- Historical developments, Characteristics, Applications, Generations and Classification of computer.
- Components of a computer: Central Processing Unit, Input and Output devices, Internal and external storage devices.

- 15 Hours

Unit 2

- Data representation in computers: Number systems, Binary numbers: Binary addition (1's and 2's complement methods), Subtraction, Multiplication and Division. Representation of integers, Fractions. Character encoding standards – ASCII, EBCDIC, ISCII and UNICODE. Issues with respect to character collation and sorting.

- 15 Hours

Unit 3

- Computer software: Types and categories
- Programming concepts: system analysis, algorithms and flow charts, Open source and proprietary software.
- System software: Purpose, Operating systems; MS-DOS, Microsoft Windows, UNIX, Linux,.

- Application software: Word processors, Spreadsheets, Presentation packages and Database Management Systems, Internet browsers, Software suites, Anti-virus programs, Sharewares, Web design tools, HTML Editors.
- File organization: Sequential, Indexed Sequential and Direct file.

- 20 Hours

Unit 4

- Computer network: Types, and Topologies. Internet: Evolution, Importance and applications. WWW, Web 2.0 and Library 2.0 tools.
- An overview of Library software like KOHA, NewGenlib, LybSys etc

- 25 Hours

Selected Readings:

1. Arvind Kumar. Ed.(2006). Information technology for all (2 vols.). New Delhi: Anmol.
2. Bansal, S.K.(2005). Information technology and globalisation, New Delhi: A.P.H. Publishing corporation.
3. Basandra , S.K(2002). Computers today, New Delhi: Golgotia.
4. Carter, R.(1987). The Information technology hand book, London : Heinemann.
5. Croucher, P.(1996). Communications and networks. 2nd ed. New Delhi: Affiliated East West.
6. Curtin, D.P. & others: Information technology: The breaking wave. New Delhi: TMH, Latest Edition.
7. Decson, E.(2000). Managing with Information technology. Great Britan: Koganpage Ltd.
8. Dhiman, A.K.(2003). Basics of Information technology for librarians and Information scientists, Vol.1. New Delhi: ESS ESS.
9. Forrester W.H. and Rowlands, J.L.(2002). The online searcher's companion. London: LA.
10. Gupta, V. (2005). Rapidix computer course. New Delhi: Pustak Mahal.
11. Hunter & Shelly(2002). Computers and common sense, New Delhi:s Prentice-Hall.

12. Jain, V.K.(1994). O Level Module I: Computer fundamentals. Delhi: BPB Publications.
13. Johri, A. & Jauhari, B.S. (1993). Computers today. Vol.1, Mumbai: Himalaya.
14. Kashyap, M.M. (2003). Database systems. New Delhi: Vikas.
15. Keren, C & Perlmutter, L,Ed.(1995). The application of mini and micro computers in Information, documentation, and Libraries. Amsterdam: Elsevier.
16. Rajaraman, V. (1995). Fundamentals of Computers. New Delhi: PHI, 1995.

18. Satish Jain. Information Technology : 'O' Level made Simple. New Delhi: BPB, Latest Edition (All modules).
19. Satyanarayana, R. (2005). Information technology and its facets. Delhi: Manak.
20. Saxena, S.(2001). A first course in computers. New Delhi: Vikas pub. House.
21. Sinha, P.K.(1992). Computer fundamentals: concept, systems and applications. 2nd ed. New Delhi: BPB Publications, 1992.
22. Shrivastava, R.K.(2001). A: Text book of Information technology, Delhi: Dominant publishers.
23. Shroff, R.(2000). Computer systems and applications, Mumbai: Himalaya, 2000.
24. Williams, B, Sawyer, S. & Hutchinson, S.E. Using Information technology : A practical Introduction to computers and Communication. New Delhi:TMH, (latest edition)

BLC 202 - Information Processing and Retrieval III: Cataloguing

(4 Credits / 100 Marks)

Unit-1

- Resource description: Concepts and definition. Library Catalogue: Meaning, Definition, Need, Purpose, Objectives and functions. History and development of Catalogue codes and practices:
- Resource description standards: ISBD, AACR2R and FRBR.

- 15 hours

Unit-2

- Physical forms and Inner forms of Catalogues.
 - Kinds of entries (Card Catalogue to OPAC) their structure and uses. Filing rules and procedures.
 - Subject Cataloguing: Design and construction, SLISH and LSH.
- 15 hours

Unit-3

- Normative principles of Cataloguing: Canons, Laws, Principles.
 - Resource sharing of bibliographic data: Meaning and importance. Centralized Cataloguing, Co-operative Cataloguing, Cataloguing at Source, CIP, Union Catalogues
- 15 hours

Unit-4

- *Current developments: WebOPACs, and Z39.50,*
 - Metadata: Meaning, Definition, Purpose, Use and types. Metadata standards: MARC-21 & Dublin Core. TEI (Text Encoding initiative), METS, TEI, EAD VRA Core etc.
 - *Consortia approach to metadata- OAI-PMH.*
- 15 hours

Selected Readings:

1. Anglo American Cataloguing Rules (2002). 2nd Ed. Rev. New Delhi: Oxford.
2. Barbara, M W., Ed. (1997).Sears List of Subject Headings, New York: HW Wilson.
3. Byrne, D. J.(1998). MARC manual: Understanding and records. Chicago: ACA.
4. Maxwell, R.L. and Connell, T.H. Eds. (2000). Future of Cataloguing. Chicago: ALA.
5. Maxwell, R. and Maxwell, M.F. (1997).Maxwell's handbook of AACR2R: Explaining and illustrating the Anglo American Cataloguing Rules and the 1993 amendments. Chicago: ACA.

6. Ramalingam, M. S. (2000). Library Cataloguing and Classification systems. Delhi: Kalpaz.
7. Ranganathan, S. R. (1955). Headings and canons. Madras: S Vishwanathan.
8. Ranganathan, S. R. (1998). Classified Catalogue code. Madras: UBSPD.
9. Ranganathan, S R. (1950). Library Catalogue: Fundamentals and procedures. Madras: LA.

BLC 203 - Information Processing and Retrieval IV: Cataloguing Practice

(1 Credits / 25 Marks)

Cataloguing of book and non-book materials according to AACR2R/RDA and creating records using MARC21 and Dublin Core.

Unit 1

- Creating MARC21 records for simple print documents.
- Creating MARC21 records for simple electronic resources.
- Creating MARC21 records for complex documents – print and e-resources.

20 hours

Unit 2

- *Cataloguing of cartographic, microforms, sound recordings, motion pictures, video recordings and electronic resources by using the latest edition of AACR/RDA:*

10 Hours

Unit 3

- Preparing Simple and Qualified Dublin Core records in HTML.

10 Hours

Unit 4

- Preparing Simple and Qualified Dublin Core records in XML.
- Preparing Simple and Qualified Dublin Core records in RDF.

5 Hours

Selected Readings:

1. Anglo-American Cataloguing Rules (2002) 2nd Rev Ed.
2. MARC 21 and Related standards for Bibliographic Records. New York: LC.
3. <http://dublincore.org>

BLC 204 - Information Technology (Practical)

(2 Credits / 50 Marks)

Exercises in the use of various Operating Systems like MS-DOS, Windows and Linux

Use of Word Processors MS Word, and Open Office Writer

Use of MS Excel, and Open Office Calc

Presentation packages

Database packages

practice on Integrated Library Management Software like KOHA, NewGenlib and LybSys etc.

Database searching exercises.

90 Hours

BLC – 205 Digital Content Development and E-Publishing

(4 Credits / 100 Marks)

Unit-1

- Content: Types of content. Digital content types, File formats, Encoding systems ASCII, UNICODE and ISCII.

- 15 Hours

Unit-2

- Markup Languages, SGML, HTML and XML.

- 15 Hours

Unit-3

- Page Description Languages: Adobe PDF and Photoshop. Legacy documents- Conversion from analog to digital, OCR Software and Adobe Capture.

- 15 Hours

Unit-4

- Electronic Publishing and scholarly communication, E-journals and e-books. Platforms, Standards and formats. DTP software. Delivery devices. Social, economic, and legal issues in electronic publishing. Use and usability issues. Economics of e-publishing. IPR and copyright issues.

- 15 Hours

Selected Readings:

1. Karen S. W. Marilynn B, Stone, T. A. (2003). Electronic publishing: The definitive guide. UK: Hard Shell Word Factory.
2. Klostermann, D. (2011). The e-book handbook - A thoroughly practical guide to formatting, publishing, marketing, and selling your e-book. Cambridge: Full Stop.
3. Loton, T. (2011). E-book publishing DIY: the do it yourself guide to publishing e-books, 2nd ed. United States: LOTONtech.
4. Meckler, L. (2011). E-book formatting, self-publishing, marketing tips updated . USA: Linda E meckler on smash words.
5. Sahida, f. k. (2010). Publishing e-book for dummies. USA: CreateSpace .
6. Schuster, C. (2011). E-publishing for writers: Trends and opportunities/Fall 2011 (Kindle Edition ed.). UK: Books to Go Now .

BLC – 206 Digital Information Management

(4 Credits / 100 Marks)

Unit 1

- Notion and Nature of Information: Data, Information, Knowledge and Wisdom. Information Life Cycle. Information explosion in modern world and need for Information organization.
- Introduction to digital Libraries. Electronic documents - Files and file formats. Electronic Publishing and scholarly communication, Web 2.0 concepts and applications – Wikis, RSS, Blogs, Social book marking, Tags, Folksonomny, Meshups, Social Networking.

- 20 Hours

Unit 2

- Search through general Search Engines, Search engines for scholarly literature, Meta Search Engines, Web Indexes, Advanced Search Techniques –Keyword search, Boolean operators, Proximity search, Phrase search, Field searching, concept searching, Wild Card search , Truncation, Searching of databases, Catalogues etc.
 - Tools of Internet search: Local search. Vertical search. Search engine optimization. Search oriented architecture. Selection-based search. Social search. Document retrieval. Text mining. Web crawler. Multi search. Federated search. Search aggregator. Index/Web Indexing. Focused crawler. Spider trap. Robots exclusion standard. Distributed web crawling. Web archiving. Website mirroring software. Web search query. Voice search. Natural language search engines. Web query Classification. Image search. Video search engine. Semantic search.
- 20 Hours

Unit 3

- Protocols and standards: Z39.50. Search/Retrieve Web Service. Search/Retrieve via URL. OpenSearch. Representational State Transfer. Website Parse Template. Wide Area Information Servers. OAI/PMH.
 - Practical component: Searching of databases, Catalogues. Searching in general search engines and meta search engines. Studying the searching features of the search engines. Searching Proquest, Pubmed, Emerald, EBSCO, JCCC.
- 20 Hours

Selected Readings:

1. Alan S. P and Sarah S O. (2009). Technical writing 101: A real-world guide to planning and writing technical content. London: Scriptorium Publishing Services.
2. Chowdhury, G.G. and Chowdhury, Sudatta (2000). Searching CD-ROM and online Information sources. London: Library Association.
3. Chowdhury, G.G. and Chowdhury, Sudatta (2002). Introduction to digital Libraries. London: Facet publishing.
4. Chowdhury, G G. (1999). Introduction to modern Information retrieval. London: Library Association.

5. Forrester, W.H. & Rowlands, J. L. (1999). The online searcher's companion. London: Library Association.

7. <http://www.chicagomanualofstyle.org/>
8. <http://www.mla.org/style>
9. Jennifer G., Gradiva C. (2011). Search engine optimization: An hour a day. London: John Wiley & Sons.
10. Karen S. W. Marilyn B, Stone, T. A. (2003). Electronic publishing: The definitive guide. UK: Hard Shell Word Factory.
11. Kenna, S. & Ross S. (1995). Networking in the humanities: Proceeding. Bowker-Saur, London.
12. Winship, I. & Alison, M. (2000). The student's guide to the Internet. London: Library Association.

Ordinance OB-28 relating to Degree of B.L.I.Sc. (Bachelor of Library and Information Science) Programme

OB-28.1 GENERAL

Ordinance relating to Degree of B.L.I.Sc. (Bachelor of Library and Information Science) Programme

OB-28.1.1 Objective of the Programme: To raise human resource with professional skills in the field of Library and Information Science

OB-28.1.2 Duration of the Programme: One year full-time credit based programme consisting of two semesters.

OB-28.1.3 Degree to be awarded: Bachelor of Library and Information Science (B.L.I.Sc.)

OB-28.1.4 Eligibility for admission: Graduates in any discipline with minimum 40% of aggregate of marks from any recognized university in India and abroad. For students of other universities in India and abroad, the relevant rules of this University pertaining to eligibility will apply.

OB-28.1.5 Number of seats and reservation: The intake capacity for the programme shall be as notified by the University from time to time. Reservation of seats for various categories will be as per the norms of Goa University.

OB-28.1.6 There shall be an entrance examination for all eligible candidates if the number of applicants exceeds the intake capacity. The aggregate performance of both, entrance examination and qualifying degree examination, shall be considered for admission.

OB-28.2 PROGRAMME STRUCTURE

OB-28.2.1 There shall be two semesters in the programme of one year.

OB-28.2.2 The number of theory courses and practicals and contact hours for each course shall be as given at Annexure 'A'.

OB-28.2.3 Attendance requirements: The students shall maintain attendance as per norms of this University.

OB-28.2.4 Field work: Every student shall work at least 30 hours in each semester in all the sections of the Goa University Library.

OB-28.3 SCHEME OF EXAMINATION

OB-28.3.1 Scheme of examination and standard of passing: The students shall be examined through Intra Semester assessment (ISA) and Semester End Assessment (SEA). The ISA shall carry 50% of the marks allotted to the course. The details of ISA shall be decided and announced by the Departmental Council in the beginning of each Semester. The SEA shall carry 50% marks of each course.

OB-28.3.2 To pass an examination in any semester, a candidate must obtain at least 40% of the maximum marks in each course by taking ISA and SEA components together.

- OB-28.3.3** A student who has not passed any semester may appear for the SEA for the course(s) in which he/she failed, in the subsequent semester by paying the required examination fee.
- OB-28.3.4** To obtain a B.L.I.Sc degree, a student shall need to pass in all the courses within a period of 2 years from the date of joining the programme.
- OB-28.3.5** The question papers of SEA may consist of objective, multiple choice, essay type and case analysis questions. A model question paper in each subject shall be prepared by the Department
- OB-28.3.6** The SEA shall be conducted internally by the Departmental Council. The papers shall be set and evaluated by the concerned faculty members teaching the subjects.
- OB-28.3.7** Class / Division shall be assigned as follows:

Range of Marks	Class / Division
70% & above	Distinction
60% & above but less than 70%	First Class
50% & above but less than 60%	Second Class
40% & above but less than 50%	Pass Class
Below 40%	Fail

Master of Library and Information Science (M.L.I.Sc.)

**Department of Library and Information Science
Goa University**

Goa University Library, Taleigao Plateau
Goa PIN 403 206

Tel: 0832-6519072/272/087, Fax: 0832-2451184

Department of Library and Information Science

Goa University

Duration of the courses : One Year Courses
(Credit Based Semester System)

Credit based Semester Syllabus for Master of Library and Information Science (MLISc)

Semester I						
13	MLC 101	Information Retrieval	T	3	75	25
14	MLC 102	Library Automation and Networks	T	3	75	27
15	MLC 103	Library Automation Software	P	2	50	29
16	MLC 104	Research Methodology	T	3	75	29
17		Optional			75	
	MLC 105	Web 2.0	T	3		31
		OR				
	MLC 106	Electronic Information Sources and services	T	3		32
				14	350	
Semester II						
18	MLC 201	Digital Libraries (Theory)	T	4	100	34
19	MLC 202	Digital Libraries (Practical)	P	3	75	35
20	MLC 203	Webometrics, Infometrics & Scientometrics	T	2	50	37
21	MLC 204	Marketing of Information products and services	T	2	50	37
22		Optional			75	
	MLC 205	Information Literacy	T	3		38
		OR				
	MLC 206	Scholarly communication	T	3		39
				14		
23	MLC 207 Dissertation	Dissertation is a compulsory component of MLISc Course and will carry 12 Credits . The Dissertation work will start from the third Semester of the Course.			300	41
					650	

Goa University
Department of Library and Information Science,

**Credit based Semester Syllabus for
Master of Library and Information Science (MLISc)**

First Semester

MLC – 101 Information Retrieval

(3 Credits / 75 marks)

Unit 1

- Information Retrieval Systems: Basic concepts, Definitions, Objectives, Characteristics, Components and functions. Functional model of an IRS.
- Indexing Systems: Indexing - Meaning, Purpose and Need. An overview of historical development in Indexing. Pre-coordinate Indexing Vs. Post-coordinate Indexing. Pre-coordinate Indexing systems – Brief outline of Chain procedure, POPSI, PRECIS and Keyword Indexing. Post-coordinate Indexing Systems – Uniterm Indexing. Citation Indexing – Meaning and importance, Different citation indexes: Shepard's Citations, SCI, SSCI. Automatic Indexing – Techniques and methods. Uncontrolled vocabularies. (15 Hours)

Unit 2

- Vocabulary Control: Vocabulary control – Meaning and importance; Controlled Vs. Free text Indexing; Vocabulary control tools – Subject heading Lists, Thesauri, Thesaurofacet, Classarus. Thesaurus construction techniques. Case Study of Controlled vocabularies/ Ontologies such, ERIC, MeSH, INSPEC, UNESCO-IB, AgroVac, UMLS (10 Hours)

Unit 3

- IR models. Concept of Ranking. : Structural models – Boolean Model, Probabilistic retrieval model, vector space model. (10 Hours)

Unit 4

- Evaluation of IRS: Purpose; Evaluation criteria; Design of evaluation programmes; Steps of evaluation; Evaluation experiments: Overview of the Cranfield test, MEDLARS, the SMART Retrieval Experiment, The STAIRS project, TREC.
- Trends in IRS: Developments, Searching and retrieval, Full text retrieval, User interfaces, IR standards and protocols.

- (10 Hours)

Selected Reading

1. A course in Information consolidation: a handbook for education and training in analysis, synthesis and repackaging of Information. General Information Programme and UNISIST, UNESCO, PGI, Paris. 1986.
2. Alberico, R. and Micco M.(1990). Expert systems for reference and Information retrieval. West Port : Meckler.
3. Atchison, J. & Alan G. A.(1972). Thesaurus construction: a practical manual. London: Aslib.
4. Atchison, J. & Gilchrist, A.(1972). Thesaurus construction: a practical manual. London: Aslib.
5. Austin, D.(1984). PRECIS: A manual of concept analysis and subject Indexing. 2nd ed.
6. Chowdhury, G.G.(2003). Introduction to modern Information retrieval. 2nd Ed. London, Facet Publishing.
7. Cleaveland, D. B.(2001). Introduction to Indexing and abstracting. 3rd Ed. Englewood, Colo. : Libraries Unlimited
8. Crawford, M. J.(1988). Information broking: a new career in Information work. London: LA.
9. Ford, N.(1991). Expert systems and artificial intelligence : An Information manager's guide. London : LA.
10. Ghosh, S.B. and Biswas, S.C. (1998). Subject Indexing systems: Concepts, methods and techniques. Rev. ed. Calcutta: IASLIC.
11. Lancaster, F. W. (1968). Information retrieval systems, characteristics, testing and evaluation. London: Facet Publishing.
12. Lancaster, F.W.(2003). Indexing and Abstracting in Theory and Practice. London: Facet Publishing.
13. Pandey, S.K. Ed.(2000). Library Information retrieval. New Delhi: Anmol.

14. Seetharama, S. (1997). Information consolidation and repackaging. New Delhi: ESS ESS.
15. Van, R.C. J. (1970). Information retrieval. 2nd ed. London: Butterworths.
16. Vickery, B.C. (1970). Techniques of Information retrieval. London: Butterworths

MLC – 102 Library Automation and Networks

(3 Credits / 75 Marks)

Unit 1

- Library automation: Definition, Need, Purpose and Advantages. Historical development. Planning for Library automation.
 - Automation of Library operations. Acquisitions, Cataloguing, OPACs, Circulation and Serials control.
 - Evaluation of Library automation systems. Criteria for evaluation. Evaluation techniques. Study of standards relevant to Library automation.
 - Application of Barcode and RFID Technology for Library Functions.
 - Application of Artificial Intelligence to Library and Information Centres
- (20 Hours)

Unit 2

- Network concepts: Meaning, and Definition. Digital and analogue signals, Modulation, Frequency, Spectrum, Bandwidth, Multiplexing (FDM, TDM, STDM, and WDM), Asynchronous and synchronous transmission, Transmission Modes - Simplex, Half-duplex and Full duplex channels.
 - Network devices: File server, Work station, Network Interface Unit, Transmission media, Hub, Repeater, Bridge, Router, Gateway, and Modem.
 - Types of computer networks: Local Area Networks – Concept, Topologies (Bus, Star, Mesh, Tree, and Ring). Wide Area Networks and Metropolitan Area Networks- Concepts, Circuit switching and Packet switching. Difference between LAN and WAN. Wireless Networks – Mobile telephones.
- (5 Hours)

Unit 3

- Network architectures. OSI and TCP/IP Reference models.
- Internet Technologies: Internet- History and development. World Wide Web (WWW).

- Protocols and its functions. Understanding TCP/IP.
 - Network Security Issues and Measures: Understanding the following issues in Network security- Security requirements and attacks, Confidentiality with conventional encryption, Message authentication and hash functions, Public-key encryption and digital signatures. Fire walls and anti- virus software.
- (10 Hours)

Unit 4

- Historical Developments of Library Cooperation and Networking.
 - Library Networks: Study of the functions and activities of OCLC, RLIN, BLAISE, ERNET, JANET, NICNET, INFLIBNET, DELNET, BALNET, MANLIBNET.
- (10 Hours)

Selected Readings:

1. Andrew S. T. & David J.W. (2011). Computer networks. Boston: Pearson Prentice Hall.
2. Balakrishnan, S.(2000). Networking and the future of Libraries. New Delhi: ESS ESS.
3. Barcode basics. <http://www.makebarcode.com/info/info.html>
4. Bose, K.(1994). Information networks in India: Problems and prospects. New Delhi: ESS ESS.
5. Carter, R.(1987). The Information technology hand book. London: Henemann.
6. Chapman, E.A.(1970). Library systems analysis guidelines. New York: John Wiley.
7. Dhiman, A.K.(2003). Basics of Information technology for librarians and Information scientists. ESS ESS .
8. DRTC(1999). Library networks in India (Seminar Papers). Bangalore, DRTC, ISI.
9. Haravu, L.J.(2004). Library automation: design, principles and practice. London: Allied publishing.
10. Jeanne, F.M. (2006). A librarian's guide to the Internet: A guide to searching and evaluating Information. Oxford: Chandos publishing.
11. Kaul, H K(1992). Library networks: an Indian experience. New Delhi: DELNET.
12. Kumar, P.S.G. (2004). Information technology: Applications (Theory and Practice). Delhi: B.R. Publishing.
13. Lucy, A. T.(2005). An introduction to computer based Library system. 3rd Ed. Chichester: Wiley.

14. Patnaik, S. (2001). First text book on Information technology. New Delhi: Dhanpat Rai.
15. Ravichandra Rao (1996). Library automation. New Delhi: New Age International.
16. Rich, E. and Knight K. (1994). Artificial Intelligence, 2nd Ed. New Delhi: T.M.H.
17. Richard J. (2006). The institutional repository. Oxford: Chandos publishing.
18. Vishwanathan, T. (1995). Communication technology. New Delhi: T.M.H.
19. Zorkoczy, P. (2005). Information technology: An introduction, London: Pitman.
12. <http://www.inflibnet.ac.in>
14. <http://www.delnet.nic.in>
15. <http://www.oclc.org>

MLC – 103 Library Automation and Databases (Practic3)

(2 Credits / 50 Marks)

Unit 1

- Creation of Database: CDSISIS / WINISIS, MySQL

Unit 2

- Use of Library software: Koha/Libsys/SOUL etc.,

Unit 3

- Database Searching. Webcats and WebOPACs, LC Catalog, OCLC etc. Internet Searching,

Unit 4

- Use of search engines: Google, Yahoo etc.

- (90 Hours)

MLC – 104 Research Methodology

(3 Credits / 75 Marks)

Unit 1

- Foundations of research: Meaning and definition, nature, and objectives of research, Types of research, Basic concepts of research. Ethics in research. Areas of research in Library and Information Science. Role of research in the development of scholarship. 5 Hours

Unit 2

- Planning of research, The Planning process; Review of literature.
- Selection of a problem for research - Mode of selection, Sources of problems, Process of identification, Criteria of selection, Formulation of the selected problem.
- Hypothesis – Meaning, Types, Sources, Functions, Hypothesis; Conceptualization;

- Research design - Essentials of good research design & its importance, Ethical aspects of research; Literature search – print, non-print and electronic sources.
- Research design / writing the research proposal. 10 Hours

Unit 3

- Research methods: Quantitative and qualitative methods of LIS research - Scientific Method, Historical method, Descriptive Method, Survey method, Observation method, Experimental method, Case-Study method. Delphi method and Interview method.
- Research techniques and tools: Questionnaire - types of questions, structured and unstructured questions, Cautions regarding questions & questionnaires. Interview schedule – Types, Merits & limitations; Measurements indices, Pilot studies. Rating scales and check lists. 10 Hours

Unit 4

- Sampling & data collection: Sampling techniques, Sample design or choice of sampling techniques, sample size, Sampling and non-sampling errors. Meaning and importance of data, Sources of data, Types of data, Use of secondary data
- Statistical analysis of data : Descriptive Statistics – measures of central tendency, mean, median & mode; Tabulation and Generalization; measures of dispersion – Range, intermediate ranges, measures of aggregate dispersion, mean-absolute deviation, the variance and covariance , and standard deviation & normal distribution. Chi-square test.
- Graphical presentation of data and report writing: Meaning & importance, commonly used graphics forms-line graphs or charts. Histograms, Frequency polygons, Ogive bar charts, pie charts & pictogram. Sociometry, Statistical Packages – SPSS.
- Research reporting: Organisation of report, Structure, Style, Contents, Guidelines of Research Reports, Methods of Research Evaluation. Technical Writing and Presentation –Tools, techniques and standards. Foot notes and references. Study of citation style manuals- APA, MLA, and Chicago. Citation Machines, Automatic citation builder, Endnote, Refwork. 20 Hours

Selected Readings:

1. Busha, C.Hand Harter, S.S. (1980). Research methods in librarianship: Techniques and interpretation. Orlando, Academic press.
2. Charles, H. et.al.(1993). Research methods in librarianship: Techniques and interpretations, New Delhi: Sage.

3. Fowler, F.J. (1993). Survey research methods. New Delhi: Sage.
4. Goode, W.J. and Hatt, P.K. (1986). Methods in social Science research. New Delhi: McGraw Hill.
5. Krishan Kumar (1992). Research methods in Library and Information Science. New Delhi: Vikas,.
6. Krishnaswami, O.R. (1993). Methodology of Research in Social Sciences. Bombay: Himalaya.
7. Leddy, P. D. (1980). Practical research: Planning design. London: Clive-Bingley.
8. Line, M.B. (1967). Library surveys, London: Clive Bingley.
9. Nicholas D. and Ritchil, M. (1979). Literature and bibliometrics. London: Clive Bingley.
10. Ravichandra Rao, I.K. (1985). Quantitative methods for Library and Information Science. New Delhi: Wiley Eastern.
10. Slater, M. (1990). Research methods in Library and Information studies. London: L.A.
11. Stevens, R.E. Ed. (1971). Research methods in librarianship. London: Clive Bingley.

Optionals

MLO – 105 Web 2.0

(3 Credits / 75 Marks)

Unit 1

- Web 2.0. Definition and Characteristic features. Web 2.0 challenges for Libraries. Web 2.0 based Library services. 15 Hours

Unit 2

- Study of the concepts and application: RSS feeds. Metadata. Tags. Tag clouds. Folksonomy, Blogs, Photosharing, Social book marking, Social networking. - 10 Hours

Unit 3

- Understanding Podcasting, VODcast and Screencast. WIKIS, Mashups, Real time communications. 10 Hours

Unit 4

- Case studies of Web 2.0 in Libraries. 10 Hours

Selected Readings:

1. Bell, A. (2009). Exploring Web 2.0: second generation internet tools - blogs, podcasts, wikis, networking, virtual worlds, and more. Georgetown, TX: Katy Crossing Press.
2. Campesato, O., & Nilson, K. (2011). Web 2.0 fundamentals with Ajax, development tools, and mobile platforms. Sudbury, Mass.: Jones and Bartlett Publishers.
3. Governor, J., Nickull, D., & Hinchcliffe, D. (2009). Web 2.0 architectures. Sebastopol, CA: O'Reilly Media, Inc.
4. Shah, S. (2008). Web 2.0 security: defending Ajax, RIA, and SOA. Boston: Charles River Media.
5. Shelly, G. B., & Frydenberg, M. (2011). Web 2.0: concepts and applications. Boston, MA: Course Technology.
6. Shuen, A. (2008). Web 2.0: a strategy guide. Sebastopol, CA: O'Reilly Media.
7. Solomon, G., & Schrum, L. (2010). Web 2.0 how-to for educators. Eugene, O.R. : International Society for Technology in Education.

MLO – 106 Electronic Information Sources and Services

(3 Credits / 75 Marks)

Unit -1

- Electronic Information Sources: Concept, Types/ Kinds, Characteristic features and use. Types of sources (Primary, Secondary, Tertiary)
- Evaluation of Information Sources. 10 Hours

Unit -2

- Electronic Information resources: Meaning and definition, Growth and development, Types.
- E-Journals, e-Books, e-Theses, e-newspapers, Blogs, Wikis.
- Free *online* Dictionaries, Non-free online dictionaries, Free Thesauri.
- Encyclopedia, Virtual Libraries, Subject gateways and Portals 15 Hours

Unit -3

- Free databases and fee based bibliographical and full text databases, subject related websites, Institutional repositories, Open Archives and digital Libraries.
- Resource Sharing and Networks: Consortia- Importance and objectives. Study of Information networks and Digital Library Consortia - OCLC, RLIN, INFLIBNET, UGC-INFONET, DELNET, INDEST, FERA, and CSIR e-journal Consortia.

10 Hours

Unit 4

Components of Information System: Libraries, Documentation Centres, Information centres, Data centers, Data Banks, Museums, Memories, Publishing Houses.

- Virtual Reference Desk, Online Reference Services 10 Hours

Selected Readings:

1. Chowdhury, G.G. and Chowdhury, Sudatta (2000). Searching CD-ROM and online Information sources. London: Library Association.
2. Cooper, M. D. (1996). Design of Library automation systems: File structures, data structures and tools. New York: John Wiley.
3. Dickson, G.W. and Desanctis, G.. Information technology and the future enterprise: New models for managers. New Jersey: Prentice Hall.
4. Ferris, Jeffrey A. (2000) Windows 2000: Development and desktop management. Indiana: New Riders.
5. Gallimore, A. (1997). Developing on IT strategy for your Library. London: Library Association.
6. Gopinath, M.A. (1984). Information sources and communication media (Annual Seminar). Bangalore: DRTC
7. <http://www.infolibrarian.com>
8. <http://www.Libraryspot.com>
9. <http://www.refdesk.com>
10. Krishan Kumar (1996) Reference service, 5th ed. New Delhi: Vikas,
11. Lesk, Michael (1997). Practical digital Libraries: Books, bytes and bucks. San Francisco: Morgan Kaufmann.
12. Ormes, Sorah and Dempsey, Lorcan Eds. (1997). The Internet, networking and the public Library. London: Library Association.
13. Sharma, Jitendra Kumar (2003). Print Media and Electronic Media: Implications for the future. Delhi, Authorspress.
14. Terplan, Kornel (1999). Intranet performance management. London: CRC Press.
15. White C M, et.al. (1973). Sources of Information in the social Sciences. 2 Ed. Bedminster Press, Tolowa, N.J

Goa University
Department of Library and Information Science,

**Credit based Semester Syllabus for
Master of Library and Information Science (MLISc)**

Second Semester

MLC – 201 Digital Libraries

(4 Credits / 100 Marks)

Unit 1

- Digital Libraries: Concepts and issues. Understanding digital Libraries. Evolution of digital Libraries- Important milestones- Pre- DLI 1, NSF and DLI 1 and 2. Development of literature on digital Libraries. DL communities - Agencies and organizations responsible for the development of DLs- CNI, CNRI, DLF. DL conferences- JCDL, ECDL and ICADL.
- Design and Organization of Digital Library :Architecture, Interoperability, Compatibility, Protocols, standards and User Interfaces, 15 Hours

Unit 2

- Content creation – Electronic documents, files and file formats. Study of different file formats. Studying PDF in detail- features of PDF. Born digital and legacy documents. Digitization- scanning, OC Ring and conversion to PDF. Electronic Publishing and scholarly communication, E-journals and e-books
- Digital Preservation, Conservation and Archival Management – Problems and prospects 15 Hours

Unit 3

- Creating Web documents- Mark Up Languages- SGML, HTML and XML. Creating documents in HTML. HTML editors and tools. Front Page and Dream Weaver. XML and its features- XML tools. DL architecture .Elements of a DL. DOI, Open URL, CrossRef and other aspects. Study of the DL content management issues- Metadata and other resource discovery issues. Access Control and DRM, Security and preservation issues. 15 Hours

Unit 4

- Open Access Movement and Institutional repositories. Case study of select digital Libraries and IRs. California Digital Library; Alexandria Digital Library; ArXive; Cogprintis; Indian Scenario 15 Hours

Selected Reading:

1. Chowdhury, G.G: Introduction to Digital Libraries. London: Facet Publishing, 2003.
2. ICADL: Tutorials on Digital Libraries. Bangalore, 2001.
3. Karen S. W. Marilyn B, Stone, T. A. (2003). Electronic publishing: The definitive guide. UK: Hard Shell Word Factory.
4. Leona Carpenter, Simon Shaw & Andrew Prescott: Towards the Digital Library. London: LA, 1998.
5. Lee, Stuart D: Digital imaging: A practical handbook. 2000.
6. Malwad, N.M. and others (1992): Digital Libraries: Conference papers.
7. Marilyn Deegan and Simon Tanner (2010). Digital Futures Strategies for the information age. London: Facet Publishing.
8. Andrew Cox (2010). Introduction to Digital Library Management. London: Facet Publishing.
9. Jenny Craven (2010). Web Accessibility Practical advice for the library and information professional. London: Facet Publishing.
10. David Nicholas and Ian Rowlands (2010). Digital Consumers Reshaping the information professions. London: Facet Publishing.

MLC – 202 Digital Libraries (Practice)

(3 Credits / 75 Marks)

Unit 1

- Installation of Greenstone. Building digital collection using Greenstone

Unit 2

- Creating Metadata. Searching, Indexing. Modifying user interface etc. in Greenstone

Unit 3

- Installation of DSpace/Eprint/OJS

Unit 4

- Building collection in DSpace/Eprint. 135 Hours

MLC 203 - Webometrics, Informetrics & Scientometrics

(2 Credits / 50 Marks)

Unit 1

- Basic concepts: Bibliometrics, Informetrics, Scientometrics – Meaning, definitions and scope. Historical development. Study of bibliographic organizations: ISI, NCB, NISTAD. 5 Hours

Unit 2

- Study and application of Classical Bibliometric Laws – Lotka's law of scientific productivity, Bradford's law of scatter, and Zipf's law of word occurrence. Other notable regularities: 80/20 rule, Success-breeds-success model, law of Price. - 10 Hours

Unit 3

- Study of the citation concepts: citation analysis, citation network, citation matrix, bibliographic coupling, co-citation analysis, Journal Citation Reports, Productivity measurement techniques, Impact factor, H-Index.
- Growth and obsolescence of literature. Various growth models, the half-life analogy, determination of aging factor and half life, real vs apparent, synchronous and diachronous. 10 Hours

Unit 4

- Science Indicators and Policy. Science Indicators. Science Policy Development. Web Impact Assessment. Link Analysis. Trends in informetrics. 5 Hours

Selected Readings:

1. Egghe, L. and Rousseau, R.(2001). Elementary statistics for effective Library and Information services management. London: Aslib,
2. Garfield, E.(1979). Citation Indexing: Its theory and applications in Science, technology and humanities. New York: John Wiley.
3. Meadows, A.J.(1974). Communication in Science. London: Butterworths.
4. Neuendorf, K. (2002). The content analysis guidebook. London: Sage.
5. Nicholas D. and Ritchi, M. (1979). Literature & bibliometrics. London: Clive Bingley.
6. Ravichandra Rao, I.K. (1985). Quantitative methods for Library and Information Science. New Delhi: Wiley Eastern, 1985.
7. Thelwall, M. (2009). Introduction to webometrics: Quantitative web research for the social Sciences. Morgan and Claypool Publishers.

MLC – 204 Marketing of Information Products and Services

(2 Credits / 50 Marks)

Unit 1

- Emergence of Information Society and Knowledge Society and conceptualization of Information as a Resource: as a commodity and Information economics, Economics of Information; Growth of Information Industry and Implications on Library and Information Services and Products. Trans border data flow: agencies in TBDF, types of TBDF, barriers in BDF – access, linguistic, legal, economic and cultural (Information Consolidators, Aggregators, and Consortia etc.) 10 Hours

Unit 2

- Marketing concepts; - Corporate Mission; Marketing Strategies. Concept of Marketing in Non-profit Organizations
- Portfolio Management BCG Matrix Model; Product Market Matrix; Product Life Cycle, Pricing Information. 10 Hours

Unit 3

- Marketing Mix; Kotler's Four P's; McCarthy's Four P's. Packing, Branding and Advertising 5 Hours

Unit 4

- Marketing Plan & Research: Corporate Identity, Marketing plans: Marketing Research. Market Segmentation and Targeting; Geographic and Demographic Segmentation; Behavioral and Psychographics Segmentation; User Behavior and Adoption. Costing and Pricing of Information products and service – objectives and Importance. Influencing factors in pricing. Techniques of pricing
- Marketing Information Products & Services. 5 Hours

Selected Readings:

Cawkell, A.E., Ed. (1987). Evolution of an Information society. London : ASLIB.

Cronin, B(1981). Marketing of Library and Information services. London: ASLIB..

Eileen, E. D.S.(2002). Marketing concepts for Libraries and Information services. 2nd Ed. London: Facet Publishing.

Jain, A.K and others Ed. (1995). Marketing of Information products and services. Ahmedabad: IIM.

Kotler, P. (1975). Marketing for non-profit organization. Prentice-Hall.

Saez, E.E. (1993). Marketing concepts for Libraries and Information services.

IASLIC (1988). Marketing of Library and Information services (13th IASLIC Seminar papers), Calcutta: IASLIC.

Optionals

MLO – 205 Information Literacy

(3 Credits / 75 Marks)

Unit 1

- Information literacy: Meaning, Definition, Need, Evolution of the concept. Historical perspective of Information literacy.
- Types of Information Literacy: Technology literacy, media literacy, computer and digital literacy.
- Levels of Information Literacy: Entry level, Mid-level, High level, Advanced level. Lifelong learning and its components. 15 Hours

Unit 2

- Partners of Information literacy.
- Models of Information literacy: SCONUL model and CAUL (Australian) model.
- Guidelines and standards for Information literacy programs: ALA and ACRL. - 10 Hours

Unit 3

- Information literacy programmes.
- Role of Libraries in Information literacy.
- Information literacy instructions in different types of Library and Information centers 10 Hours

Unit 4

- Current trends in Information literacy.
- Study of Information literacy programs in the world.
- Information Literacy Competencies
- Challenges facing Information literacy. 10 Hours

Selected Readings:

1. American Library Association. Final Report of Presidential Committee on Information Literacy. www.ala.org/at/nill/litt1sthtml
2. Barker, K. and Lonsdale, R. Ed. (1994). Skills for life: the value and meaning of literacy. London: Taylor Graham.

3. Bawden, D.(2001). Information and digital literacies: a review of concepts.
<http://gti/edu.um.es.8080/gomez/hei/intranet/bawden/pdf>.
4. Eisenberg, M.B. , Lowe, C.A. & Spitzer, K.L. (2004). Information literacy: Essential skills for Information age. London: Libraries unlimited.
5. Meadows, A.J. Ed. (1991). Knowledge and communication: essays on the Information chain. London: Library Association.
6. Pantry, Sheila and Griffiths, Peter (2002). Creating a successful e-Information service. London: Facet.
7. Zorana Ercegovac (2008). Information literacy: search strategies, tools & resources for high school students and college freshmen. California: ABC-CLIO

MLO – 206 Scholarly Communication

(3 Credits / 75 Marks)

Unit 1

- Republic of Science and Scholarship: Foundations of Science and scholarship. Principles and paradigms of scientific culture/scholarship: Historical perspective of scholarly communication systems. Scholarship and scholarly traditions.
- Study of journals, their functions, working and processes. The importance of scientific and professional societies in journal publishing; the peer review process; the migration of peer review journals from print to Web-based; Serials pricing crisis phenomena.

15 Hours

Unit 2

- Rise of Internet as game changer in scholarship, communication, and daily lives.
- Evolution of Internet/Electronic publishing; Web 2.0 and the emergence of Wikipedia; slideshare; You Tube; blogs and others as mainstream media. E-Science, Open Data and cyber Infrastructure.

10 Hours

Unit 3

- Open Access Movement: understanding OA—concepts, principles, ideology and philosophy of Open Source, Open Content; Open Educational Materials and Open Access to scientific literature; the Green and Gold route to OA. Familiarity with the people and organisations behind the OA movement.
- Study of Open source software for IR and DL: DSpace; Eprints ; Fedora ; Kete

- 10 Hours

Unit 4

- Copyrights issues. Understanding copyrights. Creative Commons. Licensing issues.
- Scientometrics and metrics of scholarly communication. Innovations in measuring Science and scholarship. Mapping Science and tools and parameters: usage and influence factors.

10 Hours

Selected Readings:

1. Derricourt, R.(1996). An author's guide to scholarly publishing, Princeton, N.J. : Princeton University Press.

Programme: M. A. (History)

Course Code: HSC-150

Title of the Course: “Doing History”: An Introduction to Historical Methods

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	None for the students of M.A. History at Goa University as it is a Core Course.	Number of hours
<u>Objectives:</u>	As an introductory course, “Doing History” aims to introduce the students to how historians work, how to “do” history, that is, to the methods of historical research and familiarise them with the tools and techniques used by historians to study the past. It is intended to introduce students to the basics of doing research in the discipline of history, the process of writing history, including the selection of a research topic, the techniques of historical research, the use of primary and secondary sources, historical criticism, analysis and synthesis. The overall objective of this course is, therefore, to provide the student with the information, skills, and tools needed to do research in the discipline of history.	
<u>Content:</u>	<p>Unit 1: History: Its Meaning and Nature What is History? Why Study History? Varieties of History History and Other Disciplines History: Art or Science? Certainty in History Causation in History. Counterfactual approach. The post-modern challenge. History and Time</p> <p>Unit 2: Beginning Research Main Stages in Doing Research in History Basic Research Skills in ‘Doing’ History Selecting a Research Topic Formulating Research Questions Preparing a Research Outline Ethics of Doing Research in History</p>	<p>12</p> <p>08</p>

	<p>Unit 3: Sources and Resources Secondary and Primary How to use of Archival Sources Doing History in a Museum Oral History. Interviewing techniques and best practices; Ethnohistorical sources Historical “Memory” versus Historical Evidence Quantification in History Online tools for History Research</p> <p>Unit 4: Interrogating Evidence and Writing History Evaluating Authenticity and Credibility of Sources Dealing with Contradiction, Confusion and Bias in Historical Sources Making notes Writing a research paper in history Citing sources</p>	<p>16</p> <p>12</p>
<u>Pedagogy:</u>	Lecture method/project-based learning/collaborative learning/ /hands-on learning through visits to archives, museums/self-study

<u>Learning Outcomes</u>	<p>Upon the successful completion of this course, the student will be able to:</p> <ul style="list-style-type: none"> • assess the importance of studying the past and presenting conclusions informed by historical research; • distinguish between and appraise primary and secondary historical sources; • articulate the process of developing research questions, conducting historical research, and presenting findings in an original manner; • identify the challenges of conducting historical research and the differences between quantitative and qualitative methodologies; • conduct historical research in a library and archive; • conduct historical research using non-textual and cultural sources; • use online historical resources to pursue historical inquiries; and • write a research paper in the discipline of history. 	

Programme: M. A. (History)

Course Code: HSC 151

Title of the Course: Debates in Indian History (Up to 18th century)

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	It is assumed that students have a basic working knowledge of the history of ancient and medieval India. Further, they should exhibit the critical thinking abilities to analyze the views of historians concerning varied topics.	
<u>Objective:</u>	It aims to provide information to the students concerning the issues such as the nature of Harappan civilization, nature of state in ancient and medieval India, and debates such as Indo-Aryan, feudalism, early medieval urbanization, segmentary state in south India, India and the world system theory, and the potentials of capitalist growth in pre-colonial India.	
<u>Content:</u>	<p>I. Early India: Harappan and Indo-Aryan Debate</p> <p>a. Harappan Civilization: Indian and non-Indian Origin; nature of state and society; Pasupati debate; Harappan and Saraswathi civilization.</p> <p>b. Indo-Aryan Debate:</p> <p>i. Standard view: Theories of original homeland of the Aryans; T.R. Tratmann, Romila Thapar, R.S. Sharma; the horse problem.</p> <p>ii. Alternative view: Aryans as indigenous people; Invasion vs. migration. B.B. Lal.</p> <p>II Early Medieval India: The Feudalism Debate</p> <p>a. R.S. Sharma: Indian Feudalism thesis</p> <p>b. Alternative view: D.C. Sircar and Harbans Mukhia</p> <p>c. Alternative view: B.D. Chattopadhyaya and Hermann Kulke</p> <p>b. Urban decay debate</p> <p>III The Medieval State</p> <p>a. South Indian state as Segmentary State ; the Devaraja model of Herman Kulke</p> <p>b. South India: Feudalism</p> <p>c. Delhi Sultanate: Theocratic or secular?</p> <p>d. The Mughal state</p> <p>i. Centralization: Irfan Habib and Athar Ali</p> <p>ii. Decentralization: C.A. Bayly and Chetan Singh</p> <p>iii. Decline of the Mughals</p> <p>IV Great Divergence Debate</p> <p>a. India and the world systems: Wallerstein, Braudel and Om Prakash.</p> <p>b. Van Leur thesis and Steensgaard's Asiatic Revolution: The Indian Response: Ashin Dasgupta and Om Prakash</p> <p>c. Was there a crisis in production in later medieval India?</p>	<p>12</p> <p>12</p> <p>12</p> <p>12</p>

	d. Tendencies of capitalistic growth in early modern India: Irfan Habib and Prasannan Parthasarathi	
<u>Pedagogy:</u>	lectures/ tutorials/assignments/self-study

<u>Learning Outcomes</u>	<ol style="list-style-type: none"> 1. Reflect on the debates such as Indo-Aryan, feudalism and segmentary state 2. Have an understanding regarding the relationship between state and society in the pre-modern period 3. Explain the nature of the pre-modern economic growth 	

Programme: M. A. (History)

Course Code: HSC 152

Title of the Course: History and Theory

Number of Credits: 4

Effective from AY: 2018-19

<u>Prerequisites for the course:</u>	No prerequisites for the course.	
<u>Objectives:</u>	The rationale for this course is to draw out the theoretical basis upon which the past has been engaged by the discipline of history and the ways in which knowledge is both pursued and argued. This combines the more philosophical questions of epistemology and leads the way in exploring 'What is History'. Starting from the speculative to critical philosophy of history, historians pose different questions, devise a theoretical context to account for, develop different methods, write different narratives and at times challenge accepted ways of doing history. The course will, in other words, enable students to see how theories developed out of arguments and historical interpretations. At the same time, it will introduce the students to a series of seminal texts by philosophers and historians. It combines theory with practice to illuminate the practical implications of theory for the writing of history.	
<u>Content:</u>	<ol style="list-style-type: none"> Philosophy of History Meaning; Speculative; Critical. Classical Greek and Roman Historiography From 'myth' to history. Ideas on history. On 'progress' and 'rationality' Enlightenment and the philosophy of history. Hegel's philosophy of history. The Practice of History Ranke. Collingwood. The <i>Annales</i> School. Beyond the <i>Annales</i>. Marxism and historical knowledge Historical Materialism; Base and superstructure. Gramsci's contribution. Thompson and the making of class. Margins and History Women and philosophy of history: Simone de Beauvoir. Subaltern School. Postmodernism and History 	<p>4</p> <p>5</p> <p>8</p> <p>8</p> <p>9</p> <p>5</p> <p>9</p>

	The nature of postmodern theory; key concepts: deconstruction, power, discourse, emplotment, orientalism.	
<u>Pedagogy:</u>	Lectures (traditional, problem-based, discussion-based); tutorials; assignment-based; seminars; problem solving-based discussions; cooperative learning; close reading of text and self-study.
